We also need to change the focus of investments from mega projects to smaller projects, financed by the savings of people directly. Before any thrust for liberalisation of imports, we need to regulate indigenous investment. The Eighth Plan Approach Paper was quite clear on this issue. We need to de-bureaucratise the functioning of the Indian economy; we need to give free play to individual enterprise and innovativeness. But the way to

achieve this is not the sudden opening up of the economy to the full blast of external competition and external capital. That could well come later, after a few years, after we have promoted free competition within the economy. Our present system of licensing and controls has favoured the giant companies and a few large business houses. The way to regulate their activities is through fiscal and financial policies. For instance, the debt:equity norms for large undertakings should be tougher than for small ones. Credit, in ample measure, should be available to the artisan, the handloom weaver, the small farmer.

Opening up the economy in the manner recommended by *The Economist*—and a lot of starry-eyed Indians—would be tantamount to pandering to the demand (for elitist consumer goods) of a 100 odd million Indians. This is a large market, almost as large as that of Western Europe (though not quite as affluent). Such a policy is likely to leave the 750 million Indians (outside of this market) in the cold. If the 'caged tiger' (to use *The Economist's* metaphor) is to be released, we need to release the energies of these 750 million Indians.

The priorities, in this context, are education, health care, care of the mother and the child, better nutrition. In order to make effective and efficient use of the limited resources, we need to de-bureaucratise the delivery of these services also. We need a 'convergence' of these services, through the people's own organisations.

We need to find employment for the presently unemployed and underemployed. This can be achieved through democratic decentralisation and the implementation of the concept of 'Right to Work', through work being found for all those seeking employment, local area development, planned by the local authorities. That would also help to protect the environment which has of late suffered steady degradation.

We need, in short, to change the priorities of the Plan effort. The Eighth Plan proposals sought to cut down public investment on large industries from 12 per cent of the total plan outlay to 7 per cent, and to raise the investment on rural development to 50 per cent, the rest being spent mainly on the development of local energy sources and other infrastructure, as well as social investments such as education, health, reduction of infant mortality, better care of the mother and child, development of small industries, and improvement of facilities which would influence people to innovate and increase economic activity generally. We need to invest on renewable sources of energy, to provide a minimum of energy (and of drinking water) to every citizen,

which will reduce human drudgery, as well as prevent ecological degradation of the countryside. These are our immediate priorities.

We also need to tone up our public sector enterprises which supply most of the infrastructure services and key inputs. That is a subject by itself, but briefly, we can do that by distancing public enterprises from government administration, by providing minority shares to workers and to the lay public (so that the annual general meetings of such enterprises can be opened up to public criticism).

But, as opposed to the view of *The Economist*, opening up the Indian economy to international capital and international competition, at this juncture, is *not* the solution. It is a solution which would attract the affluent 100 million Indians; it is also a solution which would lead to external bankruptcy, a sudden deep recession (and consequent unemployment in Indian industry), and misery to the 750 million Indians who have to be raised from their present state of ignorance, ill health and low productivity. And, as a preliminary to this effort, we need a firm acceptance of both the principle of 'federalism' and of democratic decentralisation.

Comparisons with other countries,

though occasionally helpful and useful, are illusory. They can never find the answer to the problems of any country at any time. We are constantly reminded that the world does not need India, but that India needs the world. This in itself is a reminder that we ought to learn to stand on our own feet, in the matter of internal savings to finance our development, in the matter of self-reliance in external payments. The latter does not imply either autarky or isolationism. It does mean though that we should be able to pay for our imports by our exports. That way lies our salvation, not the opening up of the economy when imports stand at around 10 per cent of the GDP and exports at around 6 per cent. Our domestic savings rate has come down from more than 23 per cent of the GDP to less than 21 per cent of late. We need to raise our own savings, be careful about inessential imports (intended to pander to the needs of a few), de-bureaucratise the functioning of the economy, and rely on fiscal and financial levers of policy to achieve a self-reliant pattern of growth.

We need an approach wholly different from that suggested by *The Economist* and starry-eyed affluent Indians who are always sucking up to the immensely more affluent West.

Mahatma Gandhi Road, Bangalore 560 001

DEVELOPMENT CONSULTANT ON WOMEN'S ISSUES

The Central Silk Board (CSB) along with the Directorates of Sericulture (DOSs) in the states of Karnataka, Andhra Pradesh, Tamil Nadu, West Bengal, and Jammu & Kashmir is implementing the National Sericulture Project (NSP), with financial assistance from the World Bank, and the Swiss Development Cooperation. One of the important components of NSP is the Beneficiary Assessment (BA), which is a project monitoring mechanism for providing the implementing agencies with independent feedback on the project's impact by carrying out concurrent evaluation using participant observation technique. CSB has commissioned three agencies viz. Institute for Social and Economic Change (ISEC, Bangalore), Centre for Studies in Social Sciences (CSSS, Calcutta), and Economic Development Associates (EDA, New Delhi) for undertaking the BA programme

The Development Consultant on Women's Issues will assist the three BA agencies on women-related issues in the BA, and organizing training programmes for sensitizing the BA research teams, and the field staff of the CSB and DOSs on gender issues. The consultancy would involve about 100 person-days per annum. Remuneration will be commensurate with qualifications and experience.

QUALIFICATIONS.

- | | |
|------------------|--|
| <i>Essential</i> | Ph D in women's studies or related fields, with a minimum of 5 years research/teaching experience in women's studies, and published works of standing. |
| <i>Desirable</i> | Should be able to work in close coordination with a diverse clientele, especially at the field level. Experience in organizing programmes on self-growth, and group processes would be an added advantage. |

ONLY WOMEN NEED APPLY

Calcutta Diary

AM

It need not be the sole prerogative of the fundamentalists or the feudal overlords to issue ultimatums; once the rest of the nation has exhausted its stock of forbearance, it too will issue threats and act upon them. There will then be plenty of Hindutva, or plenty of signing of pledges of undying loyalty to the princely household, but no India. But other, more hopeful, possibilities are not to be ruled out either. Consider, for instance, what is happening in Nepal.

RAJIV GANDHI's gory death is of a piece. This nation, if it can still be called that, is tearing itself apart, and with a ghastly application of passion. Irrespective of the impact of the tragedy at Sriperumbudur on the outcome of the ongoing elections and the kind of government that assumes power at the Centre, it is bound to be a continuum of frenzy. A brightening genre of primitivism is unleashed over large chunks of the country. History has retrogressed, tribes, whose existence one thought was one of the major attributes of pre feudal societies, have emerged as the dominant political reality in Bihar, Uttar Pradesh, Haryana, Rajasthan, Madhya Pradesh. Not just the Yadavs or the Kurmis, Brahmins or Bhumihars too are behaving like tribal conglomerates. Their vision does not proceed beyond their immediate caste concerns, they are well knit and armed to the hilt, they spurn the premises of rational thinking. The rest of the nation, they genuinely believe, do not matter. Most of them are in any event not interested in the rest of the world, an obstinate insularity defines their attitude to the global processes. The laws of economics and science and technology are to them an irrelevance. It is as if the country has slipped back two or three thousand years, and the universe consists of the narrow little confines of a couple of villages. Whatever resources these villages possess must come under the command of one's own tribe alone, the others deserve liquidation. Each tribe has come to know by now of the enormous possibilities associated with the seizure of the governmental machinery. This particular paraphernalia must, by hook or crook, be commandeered by the tribe, or by its Nehruvian variant, the family. Or else there will be war, let all other considerations drown. Parochialism could not have scaled any greater heights, India, according to the vision that has gained ground with an astonishing rapidity, is of this or that family, or this or that tribe, and this or that family or tribe alone.

Every action has its equal and opposite reaction. The emerging culture therefore is of the pre-emptive kill. A single-minded targetry has for the present halted the Nehru-Gandhi line. Perhaps the outrage had inspirations beyond a purely tribal intent, and even one or two extra-territorial ones. On the other hand, the fervour with which the purveyors of Hindutva are going about is every bit a specific manifestation of tribalism. The self-styled devotees of Rama would like time not only to stop, they in fact want it to be rolled back, not just to a prehistorical epoch, but to the mythical *Treta* era, a never never millennium where justice is rough hewn, bestowed by a supposedly benign, incorrigibly autocratic, set up of demons, gods and kings. In this curious condominium, infidels do not belong, technology is treated with contempt, economics is assumed to consist of the exclusive oracles of Chanakya, and the dominant emotion is mistrust of those who are by definition excluded from the system. About one-half of the nation may still go without food every night, about one half of the nation may still be innocent of letters, basic human rights may continue to be denied

to hundreds of millions of children, many of whom nonetheless theoretically possesses the right to vote in elections described as democratic. It is a pauperised nation, with hardly any foreign exchange reserves in the kitty. Its governing elite is however not even remotely worried. Tomorrow will take care of tomorrow. For today, high on the agenda, at the very top, is the cultivation of killing fields, the infidels, those who do not recognise our household deity or conform to our religion or our tribe or our notions of civic rights and duties, have to be exterminated. Priority is priority, land may remain untitled because of lack of facilities for irrigation, factories may close in their thousands because of the shortage of, if not demand, working capital, employment-creating programmes in town and country may languish for the same reason. So what, the principal task confronting the nation is the substitution of a mosque by a temple. Those who demur with this agenda have no place in this land of the pure, the *trisulas* are out. Or perhaps the *trisulas* are not modish enough, it is only legitimate that the country must go nuclear. Alternatively, leave it to the imperial household, it knows what is best for the nation and don't you dare say otherwise. Cost is an irrelevance, absolute preference is absolute preference, whoever does not agree with our point of view will be duly taken care of. Yes, let there be elections on the basis of adult suffrage every now and then, yes, the elections must be free and fair, but all citizens must vote for either our prince or princess charming or for our version of Rama Rajya, should they refuse to do so, they do not belong to this nation, and have thus no business to exercise their franchise, they will be undone and their property will be either burnt or taken over.

assassination have provided the opportunity of a stage rehearsal for the ultimate *dharma yuddha* the primitive tribes exercising a stranglehold on the polity are impatiently waiting for. Since Aryavarta is their principal domain, and Aryavarta by definition is India, by and large it is the ethos of the north which is impliedly to prevail; the tribal chieftains, and the rabble following them, in Amethi and Etawah and Arrah and Aurangabad, will decide who are to be shot and who are to be allowed to live, what the nation's social and economic policies are to be, what the school curricula should consist of, what obscurantist programmes the radio and the television must be made to carry.

Are they however not assuming too much? The hawkers of Hindutva may want the nation to recede into the dark corridors of irrational mythology, the votaries of a particular family may want the enforcement of norms that went defunct a thousand years ago, the entire stretch of Aryavarta these specimens may come to control by sheer muscle power, the claue of retired army brass and police chiefs currently joining in droves this or that group or tribe may temporarily provide the assurance to the rampaging crowds that, with so much of distinguished livery backing them, the fascism they love to dream of will be ushered in the country soon, very soon. But are they not bereft of the capability to look beyond their nose? They may, temporarily, have their Roman reign or their Hindu kingdom, they may, temporarily, even have their fascism, but they would still be living in a fool's paradise. They are a bunch of ignoramuses failing to realise

people's endurance, this country will cease to be. Considerable slices of the precarious jigsaw of this nation will refuse to fall in, the primitivism sought to be compulsorily imposed on the land will be rejected with derision, the threat of force will be met by counter-threat of an equal strength. India in these circumstances will shrink and shrink, Aryavarta will, temporarily, have its Hindutva and its Rama Rajya, or, alternatively, its queen from Turino, but the charade will be accompanied by bloody civil war, at the end of which Aryavarta will be left to savour its sectarian brew, while the rest of India will decide to belong to other sovereign entities. It need not be the sole prerogative of the fundamentalists or the feudal overlords to issue ultimatums; once the rest of the nation has exhausted their stock of forbearance, they too will begin to issue threats and act upon them. There will then be plenty of Hindutva, or plenty of signing of pledges of undying loyalty to the princely household, but no India.

One does not have to take into account that dark prospect alone. Other possibilities are not to be ruled out altogether. Despite the myth-makers; despite occasional stutters and occasional waywardness, the history of human civilisation—even when it is, civility be hanged, non-civilisation—is to proceed toward enlightenment; it is history's assignment to help in the evolution of the rationality of man. India is not, and cannot be, *sui generis*. The caste and communal fracas which reflect primitivism of the most dubious order could still be a passing phase. Consider, for instance, Nepal. Those itching for a Hindu kingdom of

that Nepal is quintessentially Hindu, it is, in fact, the only Hindu kingdom in the world. And yet, the Hindutva over there has failed to transform the people to the seventh heaven of bliss; the Nepalese continue to grope for a regime of justice and fairplay, a regime which will usher in a tolerably benign social order. The elections recently concluded in that country have provided the clinching confirmation, the citizenry of the only Hindu kingdom in the world are impatiently waiting to break out of the narrow, claustrophobic confines of Hindutva. The feudal reign of the Ranas is over, the Nepali Congress, the spitting image of our Congress(1), is a ramshackle coalition of disparate social categories which may collapse any day. The Nepalese people have nonetheless signalled that no tears be wasted for them, they have an alternative choice, available on tap. The obscurantism to which they had been condemned for so long has failed to impress; they have awakened to social reality; they are now actually ready to endorse the economic and social programme of the communist party. Historical determinism, in other words, has asserted itself. But if Nepal can have a tomorrow, why not Bihar and Uttar Pradesh? The obscurantists and the feudal overlords, notwithstanding their designs, may yet fail to break up the nation, the Left could yet vindicate their reputation as the truest patriots. Rajiv Gandhi's horrible ending may obscure the general picture for a few weeks. At the end of it, though, economics may well be in full command, with Nepal, the pigmy country, showing the way to its huge, lugubrious southern neighbour.

Nepali Election Results and Their Implications

Anirudha Gupta

While the Nepali Congress has won a convincing majority in the recent parliamentary elections, its near-total debacle in the Kathmandu valley has rocked the party's collective leadership.

DESPITE its humiliating defeat in the Kathmandu valley, the Nepali Congress (NC) managed to establish a convincing lead over other parties in Nepal's first post-panchayat elections. It bagged 110 of the 205 seats in the Pratinidhi Sabha and, thereby, secured the mandate to form the kingdom's next government. Its nearest rival, the United Communist Marxist-Leninist Party (UCML) emerged as a formidable opposition with 69—that is, just one-third of the total seats in parliament. Of the 42 other parties which contested the elections, only six could survive, with the United People's Front (UPF), an extremist Leftist outfit, gaining nine of the 26 remaining seats (See table).

In some ways, these results are doubly welcome. For, in the first place, they have ensured the formation of a stable government without giving it an assurance of numbers to become unduly harsh or intolerant towards its opponents. The results have denied the Congress the kind of one-party dominance it wanted (a clear two-thirds majority) in order to amend some parts of the Constitution it had itself drafted in association with its Communist partners in the interim government in last November. For exactly the same reason, the opposition headed by the 69-member UCML would not find itself in the wilderness or wholly ineffective in parliament. On many substantial issues, such as constitutional monarchy, secularism and foreign policy, the NC and UCML hold more or less similar views, though with varying emphasis. There are also indications that the top leaders of these two parties wish to avoid, at this juncture, any direct confrontation. The UCML leader, Madan Bhandari, had in a post-election interview expressed a readiness to be "accommodating", a gesture which the outgoing prime minister, Krishna Prasad Bhattarai, amply reciprocated by stressing the need for the ruling party (NC) to work in "close co-operation with the opposition for stability and consolidation of parliamentary democracy".¹

Bhattarai's brief stint as head of an interim government has made him acutely

aware of the pitfalls any popularly elected government would face in view of the opposition from an entrenched bureaucracy and its powerful patrons in quarters close to the royal palace. At times these elements tried and nearly succeeded in rocking his coalition ministry; at other times they spared no efforts to frustrate the all-party consensus for the adoption of a new constitution. Besides, the top echelons of the Nepali bureaucracy are bound by a code of 'chakrigiri', which is but a misnomer for a vassalage system that binds prominent families and clans on a feudal basis. This system gives due importance to community and caste origins: 80 per cent posts in the civil service, army and police are held by the hill Brahmins and Chhetris, while the Newars constituting just 3 per cent of the population, hold 13 per cent of government jobs.²

It is most unlikely that this feudal-cum-caste structure of administration would give way under the pressure of a new democratic system. On the contrary, it may even corrupt such a system—and perhaps sooner than one anticipates. The Nepali army and police, on the other hand, remain ferociously loyal to the palace. In May last year, when law and order totally collapsed in Kathmandu, the army intervened because the king ordered it to do so and, thus, save Bhattarai's fledgling ministry. Such a situation may again arise in future and unless the peoples' elected representatives achieve a measure of unity to override such a crisis, their experiment in parliamentary democracy may prove short-lived. This is the aspect to which Bhattarai drew attention when he stressed the need for the ruling party and the opposition to adopt a flexible policy.

Yet, in view of the formal split between the Congress and the United Left Front (ULF), which together composed the coalition ministry, this flexibility in party attitudes may not be forthcoming. The newly elected Congress chief and prime minister, G P Koirala, does not share the mild-mannered pragmatism of Bhattarai.

He is known to be bitterly anti-communist and his strong views on policy matters may yet add a new dimension to the kingdom's fractious politics.

What is most significant in this connection is the near-total debacle of the NC in the Kathmandu valley elections. Of the total 10 seats in the valley, the NC managed to win only two, with narrow margins. But the significance of the results does not lie in either the communist victory or the Congress defeat, it lies in the manner in which these results may affect the fortunes of the two parties. First, the defeat of Bhattarai as well as those of the wife and son of Ganesman Singh, the Nepali Congress 'supremo', have rocked the collective or the triumvirate which held the Congress together since the death of B P Koirala. There have been many rifts and tensions within this triumvirate (of Singh, Bhattarai and Koirala) and at one point, during the 1986 elections, it was even rumoured that G P Koirala, then general secretary, was all set to quit the party and contest the elections.³ The crisis passed and, despite personal differences between Bhattarai and Koirala, Singh managed to keep the triumvirate intact because of his undeniable record of a man of great courage and self-sacrifice. But the electoral defeat of his relatives has sullied Singh's reputation. In fact, the Kathmandu electorate reacted strongly against what it suspected to be an attempt to foist Singh's family rule in the country. Similarly, the electorate frustrated Bhattarai's bid to retain NC leadership, not so much because he wanted to perpetuate his own brand of leadership as because he was seen to be too soft towards India and the Indian Establishment.

This means that the triumvirate in the NC may cave in and, thereby, cause an imbalance both at the leadership and rank levels of the ruling party. The followers of Singh and Bhattarai may not easily reconcile to the idea of taking orders from

TABLE: FINAL PARTY POSITION

far muted, may escalate on such issues as party policies and composition of the new ministry. If the past is any pointer, one may recall the 1952 split when Matrika Prasad Koirala headed a Congress government and his dynamic half-brother, B P Koirala, led the party.⁴ The undercurrents of personal and group rivalries may again erupt in case a new equation fails to evolve among members of the triumvirate.

The Kathmandu results may, on the other hand, cement the bond between two Left groups—the Nepal Communist Party (Marxist) and the Nepal Communist Party (Marxist-Leninist)—which merged three months before the elections to form the UCML. The leaders of both groups in the new politburo have won handsomely, thus giving boost to a collective leadership just when the NC triumvirate threatens to collapse. This is a highly significant development in the history of the Nepali communist movement which has experienced frequent fragmentation since the mid-1960s. Should this process of fragmentation halt, the Left movement in Nepal may gain strength and attract smaller factions such as the Mazdoor Kisan Party and the Democratic Communist Party, which together account for four members in the elected parliament.

What may upset this comfortable scenario is the attitude the UPF members in parliament may adopt in future. Like the UCML, the Front too represents a combination of Leftist factions—Masal, Unity Centre and Communist League—which stayed outside the democratic movement and ridiculed both Congress and ULF members of the coalition cabinet for going soft on the issue of monarchy and Indo-Nepalese relations. They see a nexus between “feudal forces in Nepal and Indian imperialism”, which in their reading must be broken to bring about genuine revolutionary changes in a poor, agrarian-based economy.⁵ It is most likely that the UPF would remorselessly focus on this nexus to discredit both the NC government and UCML opposition. It is also likely that, pressed by such attacks, both the NC and UCML would progressively adopt a rhetoric which would be less complimentary to either the monarchy or India. Would such rhetoric also involve a change in policies in substance?

This new phase in Nepali politics could thus witness a fresh round of India-baiting. The ruling and opposition parties would freely indulge in this exercise, more to score points against each other than against India. But this should not unduly disturb us. It has to be recognised that, like the Nepali Congress which has close

socialist groups of the Chandra Shekhar variety, the Nepali communists too have their contacts in India. The merger of the two communist groups to form the UCML had the blessings of CPI(M) leaders: H K Surjeet attended the politburo meeting of the Nepal Communist Party (Marxist) last December. Similarly, the West Bengal chief minister, Jyoti Basu, has kept himself in close touch with the leaders of the Sahana-Adhikari faction.

All this means that the new political formations in Nepal would not like to lose their contact with India. But there would be differences; unlike the Nepali Congress which tried to extract maximum mileage from Chandra Shekhar's official visit to Nepal in February, the communists would try to develop an independent approach to tackling national problems on their own. They would not go over to China even while they speak against India. How one wishes our mission in Kathmandu, or any other capital in South Asia, stops patronising political grouping according to the single standard of which of them is more vocal in mouthing pro-India slogans than others. Such tactics have not fetched much diplomatic gains for India, but those elements dubbed as ‘pro-India’

non-entities in no time. Part of the Nepali Congress reverses in Kathmandu and elsewhere in the elections must be analysed in this light. In an earlier article in this journal, I warned against our politicians and MP getting personally too involved in Nepal's movement for democracy. Whatever kudos they obtained, they left the Nepali masses guessing as to when they would be free from interference by ‘Big Brother’ to attend to their own problems.

Notes

Caste and Candidate Selection Lok Sabha Poll in Bihar

Ravindra Kumar Verma
Nihora Prasad Yadav

The manifest influence of caste affiliations in the selection of candidates by the principal parties for the Lok Sabha election bears out the proposition that representative politics in Bihar has strengthened the caste system instead of weakening it.

THERE are numerous parties in the fray in the Lok Sabha poll in Bihar, but we have analysed candidate selection by five parties, namely, Congress, Janata Dal, Samajwadi Janata Party, Bharatiya Janata Party and Communist Party of India (CPI). These parties have fielded 205 candidates in all.

If we take first the caste clusters, it is found that 34.1 per cent of the tickets have gone to the forward castes against their total share of 15.9 per cent in the population of Bihar. The other backward castes (OBC) have 33.8 per cent share of candidates against 48.9 per cent share in population. The scheduled castes have secured 14.1 per cent of these parties' tickets against their 14.5 per cent share in population. Similarly, the scheduled tribes account for 8.3 per cent of the candidates

against their share of 8.4 per cent in the population. The minorities, mainly Muslims, have 9.7 per cent share in candidates against their 13.3 per cent share in population.

Caste-wise examination of the candidates shows that the largest share for any single caste is that of the Yadavas followed by Rajputs. Of the candidates of these parties 17.5 per cent belong to the Yadava caste and 13.6 per cent to the Rajput caste. These two castes account for nearly half the candidates of their respective caste clusters or groups. The population of Yadavas in Bihar is 14.6 per cent and that of Rajputs 5.9 per cent. Of the total candidates belonging to the forward castes group, Brahmins constitute 8.7 per cent, Bhumihars 7.8 per cent and Kayasthas 3.9 per cent compared to the

TABLE 1: CLASSIFICATION OF CANDIDATES OF MAJOR POLITICAL PARTIES BY CASTE

| Caste | Congress | Janata Dal | BJP | SJP | CPI | Total |
|-----------------------------|----------|------------|----------|----------|---------|----------|
| Brahmin | 6(11.1) | — | 8(14.8) | 2(3.8) | 2(25.0) | 18(8.7) |
| Bhumihar | 7(13.0) | 1(2.7) | 7(13.0) | 1(1.9) | — | 16(7.8) |
| Rajput | 7(13.0) | 5(13.5) | 6(11.1) | 10(19.0) | — | 28(13.6) |
| Kayastha | 1(1.8) | — | 3(5.5) | 4(7.7) | — | 8(3.9) |
| Total forward castes | 21(38.9) | 6(16.2) | 24(44.4) | 17(32.6) | 2(25.0) | 70(34.1) |
| Yadava | 5(9.3) | 9(24.3) | 8(14.8) | 8(15.4) | 5(62.5) | 35(17.5) |

13.6 per cent share of Rajputs. Among the other backward castes group, other than Yadavas, Kurmis, Koiri, Bania, Mallah, etc. are the major constituents. Thus the OBC group can be divided into two sub-groups—Yadavas and non-Yadavas—with the Yadavas' share being 17.5 per cent and that of the non-Yadavas 16.3 per cent. The caste break-up of scheduled caste, scheduled tribe and Muslim candidates is not available for analysis. However, it may be mentioned that all the candidates among scheduled castes belong to the Pasi, Dusadh, Chamar and Dhobi castes.

The Congress has allotted 38.9 per cent of its tickets to the forward castes, of which 11.1 per cent has gone to Brahmins, 13 per cent to Bhumihars, 13 per cent to Rajputs and 1.8 per cent to Kayasthas. It has provided 25.9 per cent of tickets to the OBC group, of which 9.3 per cent has gone to Yadavas and 16.6 per cent to Kurmis, Koiris and Banias. The Congress has provided 14.8 per cent tickets to scheduled castes and 9.3 per cent to scheduled tribes. The Congress Party has given 11.1 per cent of its tickets to Muslims. A big chunk of Congress nominees are thus from the forward

castes, mainly Brahmins, Bhumihars and Rajputs. At the same time, the party could not avoid giving a substantial share to the Yadavas.

The Janata Dal has allotted only 16.6 per cent of its tickets to the forward castes, comprising Bhumihars (2.7 per cent) and Rajputs (13.5 per cent). Of the total candidates of the Janata Dal 40.5 per cent are drawn from the OBC group. Among the OBC group, Yadavas have secured 24.3 per cent of the tickets, compared to Koiris (8.1 per cent) and Kurmis (8.1 per cent). The politically viable OBC group caste Bania

has not been provided any ticket by the Janata Dal. However, as part of the seat adjustments, JMM has fielded one Bania from a constituency where the JD has not fielded any candidate. The Dal has provided 16.2 per cent tickets to scheduled castes and 5.4 per cent to scheduled tribes. A remarkable fact is that the Janata Dal has provided the second largest share of party tickets, after the Yadavas, to the Muslims amounting to 21.7 per cent. Yadavas and Muslims together constitute 46 per cent of total JD candidates.

Like the Congress, the BJP has provided the largest chunk of tickets to the forward castes (44.4 per cent). Out of this, 14.8 per cent tickets have gone to Brahmins, 13 per cent to Bhumihars, 11.1 per cent to Rajputs and 5.5 per cent to Kayasthas. The share of the OBC group in BJP candidates amounts to 31.5 per cent, the largest share of which has gone to Yadavas (14.8 per cent) followed by Banias (7.4 per cent), Koiris (5.5 per cent) and Kurmis and Mallahs (1.9 per cent each). The BJP has allotted 14.8 per cent seats to the scheduled castes and 9.3 per cent to the scheduled tribes. It is notable that the BJP has not provided any ticket to the Muslim community, though the party has given one ticket to a Christian nominee.

The Samajwadi Janata Party has provided 32.6 per cent tickets each to the forward castes and the OBC. However, among the forward castes, the SJP has given the largest share (19 per cent) to the Rajputs compared to 7.7 per cent to Kayasthas, 3.8 per cent to Brahmins and 1.9 per cent to Bhumihars. Among the OBC group, the SJP has provided 15.4 per cent tickets to Yadavas, 3.8 per cent to Koiris and 13.4 per cent to Kurmis, Banias and Mallahs together. The SJP has provided 13.5 per cent tickets to the scheduled castes and 9.7 per cent to the scheduled tribes. In the Congress fashion, the SJP has provided 11.6 per cent tickets to Muslims. The party is apparently dominated by Yadavas and Rajputs.

The CPI has seat adjustments with the

Medieval and Early Colonial Assam
Society, Polity, Economy

Janata Dal and so has fielded only eight candidates. It has allotted 25 per cent of its tickets to the forward castes and the rest to the OBC. Among the OBC the CPI has given 12.5 per cent tickets to Yadavas and the rest 12.5 per cent to Koiris. The CPI has not provided any ticket to SC, ST and Muslims.

As for the Lok Sabha elections in Bihar, Congress's participation again remains poor. The total number of women contestants was 12 each in 1967 and 1971, 9 in 1977, 19 in 1980, 16 in 1984 and 10 in 1989. For the parties under review here the total number of women candidates is 12, amounting to merely 9.2 per cent of the total number of candidates. Congress has provided relatively more tickets to women than the other parties. The Congress has allotted 9 tickets to women compared to BJP 5, BJP 4 and JD one. Of all women candidates 21.1 per cent each are Bhumihsars and Scheduled Castes and 14.7 per cent each belong to Rajputs and Kayasthas. Women from Yadava and Bania castes and Muslims constitute 5.3 per cent each among total women candidates. Of total women tickets 10.5 per cent have gone to the scheduled tribes.

The Congress Party has allotted tickets to women belonging to Bhumihsar, Rajput, Yadava, scheduled castes and scheduled tribes. The BJP has distributed its tickets to women confined to the forward castes (Bhumihsar one and Kayastha three). The Janata Dal has given its single women's ticket to a Bhumihsar woman. The BJP has provided tickets to women belonging to OBC, ST and Muslims (20 per cent each) and SC (40 per cent).

The caste factor, it should be clear from the above, has a great bearing on politics in Bihar. Though political parties cannot entirely confine themselves to caste or social groups for their ideology and support, the weightage given by particular parties to particular castes is evident. Parties which promise social justice, sharing of power and protection of depressed classes (JD and CPI) have largely concentrated on the OBC, SC, ST and minorities. Parties like Congress and BJP have, on the other hand, concentrated on the forward castes, followed by the stronger among the OBC. The BJP has distributed its tickets more or less evenly among all the caste clusters.

It may be concluded, following M N Srinivas, that the caste system is strengthened rather than weakened by representative politics in India. No doubt there has been some shift in dominant status from the upper castes to the intermediary castes (OBC), but the caste system has not been disrupted. Also, the

behaviour of castes in India is akin to that of status groups in other societies. While polarisation of castes has taken place, this cannot be regarded as synonymous with economic polarisation in society. The essence of this polarisation is social status based on political power and authority.

Finally, in the given pattern of sharing of political power certain groups are bound to be denied political power, at least relatively speaking. Even parties that champion social justice have thought of advancement of such justice on the basis of caste groups, ignoring intra-group

social justice; in other words, they have provided a disproportionate share of political representation to one or the other caste at the cost of other castes of the same group. As such the emergence of new deprived castes is inevitable with these castes expressing their discontent and fighting back in the near future.

Most important, we have seen, the political parties do not care for women's participation and women's share in political power and thus perpetuate established social traditions against women.

Elections: Violence against Poor

Bharat Dogra

Candidates who represent the poor are a particular focus of violence which even the police encourage.

THE reports of widespread election-related violence from various parts of the country have tended to ignore one important aspect: the extent to which this violence is directed against the weaker sections of society and the candidates who genuinely represent the aspirations of these sections in the elections. Due to a host of factors there are not many constituencies in which such candidates are strong enough to become serious contenders for electoral victory. But where they have managed to acquire a strong presence, after a difficult and prolonged struggle involving many sacrifices, well-organised and cruel efforts are set in motion days before the election to hinder their efforts and hound them out of a possible victory.

This can be seen clearly in the pre-election scene in the Karimnagar Lok Sabha Constituency of Andhra Pradesh. Here a CPI(ML) (Resistance) candidate N V Krishnaiah, who had earlier been elected to the State assembly, is seeking election for the Lok Sabha. He has a strong base to damage which arrests and torture have been unleashed by the police against his supporters.

To quote from a letter written to the chief electoral officer, Andhra Pradesh, by C Kondapi, convenor of Election Watch, a citizens' committee to oversee the conduct of the elections and to educate the voters on their rights, "The police machinery in the district (of Karimnagar) has openly taken up the political task of defeating the CPI(ML) candidate N V Krishnaiah. Obstruction of canvassers, disruption of election meetings by preventing people from attending them, arrests and torture of supporters and openly

threatening people that they would be liquidated if they vote for the CPI(ML) are being routinely and openly done by the police. Repeated representations to the administration and election authorities in the district have yielded no positive result."

'Election Watch' has also forwarded a list of 60 incidents of arrests, tortures, extortions and insults of a serious nature. In a most revolting incident reported from Gangadhara police station, three women activists of CPI(ML) were stripped and beaten by women police, in front of male policemen who threatened to rape them. These 60 incidents incidentally only cover the period up to May 15. Since then there have been further assaults on the activists of the party. According to CPI(ML) sources in Karimnagar, two activists Sanjeeva and Gangaia have been arrested and killed.

Nishant Natya Manch, a Delhi based street theatre group which visited Karimnagar to mobilise support for the CPI(ML) electoral effort, was hindered time and again by the police and their programmes disrupted. The police have openly threatened the artistes saying that they would be killed if they continued to stage plays there. The functioning of the party's election office has also been disrupted as have been the election meetings. Leading political parties appear to be supporting the terror tactics of the police. Somewhat similar obstructions have been put in the way of the party's candidate in Nalgonda constituency.

If this is the treatment representatives of the poor receive during elections what sort of equal opportunities are available to them in the sort of democracy that exists in India?

Story of Hadmatiya

Adivasi Struggles in South Rajasthan

On April 2, 1990, the tribal village of Hadmatiya in south Udaipur district was subjected to a brutal police assault. Nearly a year later this village was attacked yet again and destroyed. These organised attacks reflect the social tensions generated in the course of a process of development that perpetuated conditions of deprivation and dependence for large sections of tribals in this region.

HADMATIYA is an adivasi village situated in Salumbar tehsil of south Udaipur. The village was settled about two generations ago when adivasis migrating down from the hills cleared the open scrub forests and began cultivating the land. At present there are about 200 households living in the village. Rainfed agriculture is the basis of the village economy. Maize is the main crop but when the rains are good a second crop of wheat and gram can also be sown. The moist tankbed has traditionally been used for sowing winter crops in the dry season. Even though the individual holding of about seven bighas does not seem meagre, the cultivator is rarely able to eke out a subsistence from such a holding. In Normal years the adivasi household has enough only for three four months subsistence. In better years the household stocks could last for about seven or eight months. Only one-third of the cultivated area receives irrigation.

The Madar-ka-nala is the main source of irrigation. A new tank was built after the last drought two years ago. The village well is used mainly for drinking water and the *charas* (persian wheel) is in a state of disrepair. A few years back large sums were sanctioned for tubewells under the Jeewandhara Scheme of the LIC. These sanctions were largely under false names. At present all the four wells (costing between Rs 1,500 to Rs 1,800 each) are lying incomplete. In any case, tubewells are useless since the village has no electricity connections. Moreover, the overriding need in this region is not additional expenditure on tubewells but on bunding and levelling operations (*medhbandi*) since better land and water management are crucial for the development of agriculture in this dry, inhospitable tract.

The forest provides some possibility of self-provisioning. While the village itself does not have any forest, the adjoining village of Ghatet has about 105 ha of forest land. Timber that can be used for house-building is not available in this forest, but the adivasis are able to collect up to eight to 10 bundles of fuelwood in a month. A headload of fuelwood can be

sold in the adjoining *vyapari qasba* (market village) of Bhabrana for about Rs 10-12. But this source of income depends on the whims and vagaries of the forest officials. With the depletion of forests the tribals are forced to go longer and longer distances even for their own requirements of fuelwood. Unlike the forests in the adjoining tehsils minor produce like gum and *katha* are not available in these forests. The cumulative impact of successive years of drought and the dearth of pastures and grazing land has told on the livestock of the tribals. Ever since green fodder has become practically non-existent, milch cattle have stopped yielding milk.

With the livelihood traditionally derived from land, forests and livestock becoming increasingly insecure, the adivasi is forced to seek employment elsewhere. The possibility of finding work as agricultural labour is limited. Further very few industries have been set up in the area. So the adivasis generally seek casual employment, locally through contractors, in public works, construction sites or hotels and *dhabas*. Such casual labour is insecure, uncertain and grossly underpaid. Daily wages for both men and women are about Rs 10-12 in the region, i.e., about half the legislated minimum daily wage of Rs 22. The villagers also go to Aspur, Salumbar and Jhallara after the rains to cut grass, and to Udaipur for casual employment as construction workers. The Sanjela soapstone mines are not very popular but many have gone to Ahmedabad and even Vadod to seek employment as loaders, or in *dhabas* and hotels. Such migration is usually of a couple of months duration, in the course of which they normally collect about Rs 300-400.

Over the years the adivasis of Hadmatiya have become indebted to a money-lending-trading family based in Salumbar. Starting with a small trade in cloth this family has grown to control the bulk of the land in Hadmatiya and has gained control over the bulk of the village land. At the time of the land reform settlement of the fifties, 278 bighas in the village were allotted to the moneylender (573 bighas

if we include the area in the adjoining villages). After the implementation of Land Ceiling Act in the 70s, 90 bighas were transferred to the villagers. However, they were not aware of this until recently and have been paying a one-fifth share of their harvest as rent. Those whose fields have been mortgaged to the moneylender part with half their harvest. He has also taken over the cultivable land of the tankbed which has traditionally been cultivated by nine adivasi families. A large number of the adivasis are bound by the growing burden of debt to work as *sagars* (bonded labour) on the moneylenders' fields. They are forced to borrow bullocks against the payment of a bag of grain at harvest. (That is, after a harvest of about six bags of grain from the mortgaged field, the adivasi is left with only two to subsist on, after paying the dues of four bags of grain to the moneylender.)

Every bit of protective legislation that has been promulgated to safeguard the interests of the tribals against such exploitative practices has been flouted. Conditions in terms of infrastructure and community services in the village are abysmal. Drinking water is brought from the village well and hand-pumps. Electricity poles have been put up but the wiring has not been completed for more than two years. There is a primary school three km away but classes are rarely held despite the appointment of five teachers. The nearest primary health centre is at Matasula, nearly 10 km away. The hospital is at Salumbar 35 km away, but there is no public transport available to take a patient to the hospital. The State's developmental and welfare efforts have apparently left the lives of the tribals untouched.

ATTACKS ON HADMATIYA

Tensions had been brewing in Hadmatiya for sometime with the continual harassment and extortion the villagers were facing at the hands of the Salumbar-based moneylender, Tasdukh Hussain. Villagers from Hadmatiya contacted the activists of Rajasthan Kisan Sangathan, sometime in the beginning of 1990. The immediate issue was that of cultivation rights of the village tankbed traditionally with the adivasis.

On March 2, some villagers commenced the cultivation of *moong* in the tankbed. On March 5, 1990 an FIR had been lodged by the moneylender accusing 37 adivasis of theft and trespassing (the case is still pending). At 11 am the same morning the SHO Jhallara (Mohammad Sharif) and the SHO Salumbar (Narain Singh), along with nine other constables reached the village. Some women were manhandled. The provoked villagers retaliated by throwing stones and a few

retreated and promptly filed cases of assault and attempt to murder against the villagers. The police vendetta was, however, not limited to registering such cases. The sangathan leaders had met the district administration and an impartial enquiry by the administration into moneylending and land-ownership in Hadmatiya had been ordered. But the police went on a rampage even before this investigation, scheduled for April 4, could commence.

On April 2, 14 jeeps, 4 trucks and a bus load of policemen and some henchmen of the moneylender arrived at the village temple. The village was surrounded and the villagers were chased and herded forcibly in a field near Dhavda. Indiscriminate firing followed. Women were stripped and beaten up.

There was no authorisation for this firing which caused injury to 35 adivasis. The police claimed provocation and lodged cases of attempt to murder against 47 villagers. The case has been commuted to that of assault and is currently pending against 30 villagers. The false cases and the firing are part of the attempt to intimidate and terrorise the villagers who had begun organising against the exploitative practices of Tasdukh Hussain. Despite the fact that many of these practices should have come under the purview of the protective legislation for tribals, police assistance was made available to the money lender and this brutal attack was launched.

After last year's firing the villagers of Hadmatiya refused to pay Tasdukh Hussain any rent and began resisting his extortionate demands. Even in the face of police reprisal cases were filed against the SHO Salumbar and the SHO Jhallara. The activities of the Rajasthan Kisan Sangathan began antagonising a range of people. The *patwari* was forced to return bribe money and to explain to the villagers the status of their land rights. They opposed the unfair practices and hoarding activities of traders in Bhabrana and adjoining villages (including the Sahkari Samiti retailer Abhay Singh of Badatalab). The forest officials and the associated interests who had been getting rich on the fat of the land found themselves increasingly unable to continue the illegal trade in forest produce. The activists of the sangathan in Hadmatiya had put a virtual stop to illegal felling. Truckloads of wood were not allowed to be removed from the forest. The sangathan even lodged a case against the forester Shambhu Singh and a trader from Bhabrana, Bhawarlal Somani, for assaulting tribals of the village. Worse than the loss of income was the fact that the tribals were somehow "being given the impression that the forest belongs to them".

and trading interests, the police and the forest mafia, the sangathan also antagonised sections of the tribal population. They have posed a challenge to the traditional leadership in the village communities. Tejiya, the *gamethi* of the nearby village of Jhadap, was one such tribal chief who had begun feeling increasingly threatened by the growing base of the sangathan in his village. About 20 families in Jhadap support the sangathan. The *gamethi* traditionally has the absolute authority over the lives of the other adivasis. Tejiya had prescribed a code of conduct for the villagers. This had to do with ritual offerings at marriages and feasts apart from allowing him the right to levy fines for any disregard of the code.

It is therefore not entirely accidental that the recent attack on Hadmatiya was precipitated by an altercation between two of its villagers and an adivasi truck driver from Jhadap on February 28, 1991. The form in which these smouldering tensions manifested themselves subsequent to this skirmish has allowed the real issues to get obscured.

On the day after this incident some persons from Hadmatiya went to Jhadap to settle the issue. They were attacked and two of the group were detained forcibly. A group of about 25-30 persons had to rescue them. The next day two groups from the two adivasi villages congregated near Bhabrana in a tense confrontation, but there were no clashes. By the time the police reached the spot the crowd had dispersed.

At eight the same evening four persons from Hadmatiya informed the Jhallara *thana* of their fears of an attack. By 11 the same night police reinforcements had been sent by the superintendent of police, Udaipur to the *thana*. The patrolling police discovered 'nothing untoward' but the Hadmatiya villagers assert that meetings and plans were afoot that evening for the next day's attack. Bhawarlal Somani, Avtar Singh and Lakshman Singh of Bhabrana, Abhay Singh of Badatalab, Tej Singh of Bhopalpura and Sarup Singh of Kothar and Shambhu Singh the forest officer and other powerful persons of the region are reported to have been involved in this meeting. Their antagonism to the growing activism of the tribals has been brewing for a long time. In any case, it seems unlikely that a minor altercation would lead to such mob violence without more powerful backing.

Around 11.30 on the morning of March 3, an armed mob of about 400 to 500 persons had collected near Hadmatiya. They consisted of people from Jhadap, Bhabrana, Manpur, Matasula, Bhopalpura, Badatalab, Kothar and Lohagarh. The first house to be attacked was that of Mangilal (Sanjela village), the

The attackers systematically looted and burnt houses in those *phallas* of Hadmatiya where the sangathan activists lived—Dhadawada, Sagdawada, Gamethi, Gaddha and Phutatalab. Most of the villagers escaped to the nearby fields. Those who could not were badly beaten. Goats were slaughtered and burnt. Seventy houses were destroyed. All that remains in the wreckage of the gutted dwellings are charred and crumbling walls, broken tiles, broken *chakkis* and grain bins, charred remnants of the wooden doors and scattered ash.

The police arrived too late to prevent the carnage or round up the attackers. This despite the fact that four persons

from the village had gone to the *thana* the previous night and requested police protection for the village. They were detained that night for 'their own security' but no one from the *thana* thought it necessary to accompany them to the village the next morning. We were told that a few villagers had returned twice on the morning of the third to the *thana* to report the congregation of an armed mob near Hadmatiya but no assistance was sent. According to the SP, Udaipur, a police contingent was sent as soon as the patrolling police saw smoke arising from the village. Whatever the point of time or circumstances in which the police arrived, it is clear that the attackers had a field day and that no serious attempts were made either to prevent or restrain the attack. For, it is difficult to believe that an armed mob of 500 persons could become invisible to the patrolling police on duty explicitly to prevent a confrontation at Hadmatiya. Also, if the terrorised villagers could go a number of times from the village to the *thana* on foot, that morning, why couldn't the police with better transport facilities make it on time to the village? The contrast with the police forces' prompt assistance to the moneylender Tasdukh Hussain, last year, is a stark reflection of the insidiously partisan role of the local police.

The first arrests were made only the next morning after the SP, Feroz Khan, arrived on the spot and surveyed the village. The Hadmatiya villagers were understandably wary of police interventions, given their bitter experience of police 'protection', and initially refused to file FIRs. (This refusal is now being held against them.) Six persons were arrested. They are all adivasis belonging to the Dayma tribe. (The Daymas are listed as a criminal tribe. More relevantly, many of them work on the fields of the Rajputs in Manpur.) The main perpetrators of the attack according to the sangathan activists continue to remain outside the purview of legal action.

The estimated loss is more than Rs 4 lakh. Rs 2 lakh have been sanctioned by the government in addition to Rs 1,500 per family under a group insurance scheme. This amount is yet to reach the villagers. In the meantime provisions for food for about seven days were made. Only there are no stoves or fuel to cook with and nothing with which to grind the grain. Blankets have been distributed to those families with more than five members, that is 50 blankets for the 365 affected persons.

The government has promised supplies of *kelu* (clay tiles) to repair their roofs. But the charred wreckage of what was once the home of the adivasis needs much more than a roof. The wooden structure that supports the mud walls has to be built

again. Timber for house construction can be collected free of charge by the villagers but there are no forests nearby which have the right kind of wood. More important, the requirements of rebuilding 70 houses cannot be met without a major felling operation. The normal cost of building houses is about Rs 8,000. House building is normally something that is planned at least two years in advance. Labour for building is normally provided by the community. But to rebuild 70 houses together requires more labour than the village can provide collectively. The attempts at granting relief to the adivasis who have lost their homes are apparently as far removed from their struggle for survival as the process of development that has denied them the right to a decent life and livelihood.

The role of the local politicians in the aftermath of the attack is revealing. The Congress ex-MLA Kamalabhai (Lasadiya constituency) threw caution and the constraints of pre-electoral appearances to the wind and campaigned vociferously against the grant of relief to the villagers. The fact that he lost the last elections by a narrow margin of 800 votes may be partly due to the influence of the sangathan. The stand of the State president of the Congress, H P Prabhakar, was more politic. Relief, according to him, should be given to any victimised party, be it an expropriated *jagirdar* in need of rehabilitation or an impoverished adivasi who has lost his home and all his assets. The local BJP MLA, Narayanbhai, was less visible despite his covert support to the demand for the release of the arrested attackers. Even though Narayanbhai did not visit the village after the attack, the BJP-affiliated organisation, Vanvasi Kalyan Parishad (VKP), surveyed the area and issued a variety of unsubstantiated charges (*Rajasthan Patrika*, March 19, 1991) against the sangathan, including a ridiculous claim that the sangathan was forcing religious conversions. Among the most vicious of these charges was the threat allegedly issued by the Sangathan to the *sarpanch* of Bhabrana that they would kidnap "women of five Jain families" if he failed to pay Rs 50,000. The adivasis of Hadmatiya are conscious of the VKP's hostility to their democratic struggles and refused to accept the *lotas* and *thalis* sent to them by way of relief after the attack.

The attack on Hadmatiya is clearly an attack on the sangathan. The houses that were burnt were all those of sangathan supporters. Repeated demonstrations led by the ex-MLA Kamalabhai demanding the release of the arrested persons took place in the area. More startling was the opposition to the grant of any relief to the affected villagers. A few days later (March 9) a PUCL (Rajasthan) team in-

vestigating into the incident was attacked when they entered Bhabrana by a group of 50 people which included Sarup Singh and Bhawarlal Somani (both are merchant moneylenders). The RKS activist accompanying them was seriously injured and had to be hospitalised.

The fact that the attackers were predominantly adivasis has led to the obscuring of the root cause of the growing tensions in the region. The administration is projecting the incident as an inter-adivasi conflict. Such a projection is convenient to those opposed to the struggles being spearheaded by the sangathan. The sangathan is being charged with being high-handed and intimidatory in drawing its membership, and of increasingly taking the law into its own hands. From such a viewpoint, the attack on the village is the result of naxalite 'extremism'. These charges of 'extremism' are apparently merited by the growing ability of the adivasis to assert and enforce democratic rights that have been denied to them not only through the subversion of legal processes but, more pervasively, even through its actual implementation.

The violent and unrestrained hostility of certain sections to the RKS is beyond dispute. The attack and the events unfolding in its aftermath bear testimony to the range and power of such hostile forces. These forces, be it the local police, local forest rangers, traders of Bhabrana, the *gamethi* of Jhadap or the moneylender Tasdukh Hussain, found their hegemony being challenged by the growing influence of the sangathan. It is precisely this hegemony that led to the tensions in Hadmatiya in the first place.

Both the attacks took place under the regime of the BJP government. The change from Congress to BJP has apparently made little difference to the pattern and strategy of development that was marginalising large sections of the adivasis. Under the BJP, however, this economic strategy is sought to be reinforced by a dangerous revivalist ideology. The BJP has been attempting to make inroads among the adivasis, virtually all of whom are Hindus, both through its 'philanthropic' organisation, the Vanvasi Kalyan Parishad, and through its recent rathayatra that passed through Rajasthan. The attempt to bring adivasis into the fold of the agitation for the disputed Ram Janmabhoomi temple at Ayodhya is not without its ironies in this region. For the rathayatra was particularly well received in Aspur where the Rajputs have been trying, for a long time, to gain control of the Bijwa Mata temple belonging to the adivasis. The most ominous aspect of the BJP-VKP campaign is the offensive they have launched against the democratic struggles of the adivasis. These struggles are resisting the continuous harassment

and extortions suffered at the hands of moneylenders, traders, forest officials, *patwaris*, contractors and middlemen whose intervention is integral to the 'development' of tribal regions. Political parties and the processes of electoral democracy in this reserved constituency have evidently served to strengthen the power of the forces that precipitate incidents like that witnessed in Hadmatiya.

The civil society of the tribal communities is already being eroded by the development process which was displacing communities and creating gradations within them. The tribal community is far from being a homogeneous collective. The collusion of sections with the vested interests responsible for the deprivation and oppression inflicted on the adivasis creates oppositions to any democratic struggles even within the community. Added to this is the electoral process in reserved constituencies that strengthens and legitimises such collusions with exploitative mechanisms. While the constituency of the elected representatives of the people is derived largely from the adivasis (a constituency that is mustered through the crucial intervention of the *gameithi*) the clinching support in terms of muscle and money power is derived from precisely those sections that are responsible for unleashing these processes.

Last year's attack was clearly and starkly a response to the resistance of the Hadmatiya adivasis to a moneylender's usurpation of their land. If a year later the conflict and its focus are less defined it is because the dimensions of the conflict have become more complex. More importantly the range of interests antagonised by the *sangathan* have also become more organised. What remains unchanged however are the privations and pressures the adivasi faces and the violence of the reprisal against any struggle to change this exploitative structure or even to fight for constitutionally guaranteed rights. The right of the people to organise and struggle against oppressive forces, through movements like that launched by the Rajasthan Kisan Sangathan has to be defended by all democratic sections of society.

There is nothing remarkable in the story of this tribal village in Salumbar tehsil. The same processes are at work in different ways across the tribal belt in Udaipur, Dungarpur and Banswara districts of south Rajasthan. But the experience of Hadmatiya is important in that it reveals with stark brutality the repercussions of the organised attempt of the villagers to resist these processes.

[This article is excerpted from a report of the PUDR team which investigated the violent incidents.]

THE TATA IRON AND STEEL COMPANY LIMITED

NOTICE

Notice is hereby given under Section 154 of the Companies Act, 1956, that the Register of Members of the Company will be closed from Wednesday, the 3rd July 1991 to Monday, the 22nd July 1991, both days inclusive.

The Transfer Books of the Company will also remain closed for the aforesaid period.

Notice is also hereby given that the dividends for the year ended 31st March 1991, when sanctioned, will be made payable to those shareholders whose names stand on the Register of Members of the Company on Monday, the 22nd July 1991.

No tax at source will be deducted if the dividend payable to a shareholder does not exceed Rs 2,500/-. Other members whose income is below the taxable limit and who desire to get their dividend without deduction of tax may file a declaration in Form 15G, in duplicate, before Wednesday, the 3rd July 1991, with the Company's Registrars.

Assassination and After in North-East

Kamarupee

With the stakes in the present elections, especially those to the State assembly, being very high, and with every section of the people very highly politicised, it is unlikely that the 'sympathy vote' will be a major factor in Assam.

THE assassination of Rajiv Gandhi and the 'sympathy wave' that it is expected to generate in favour of the Congress(I) in the rest of the country is unlikely to reach the north-east region or even if it does is unlikely to substantially affect the voting pattern in the region. The only exception is likely to be Meghalaya where the Congress(I), normally always poised to do well, is at present rather shaky because of several local factors like the unexpectedly notable impact that the Bharatiya Janata Party candidate has been having in the Shillong (ST) seat and the disaffection within the Congress(I) over the failure of the party high command to renominate the candidate who had won the Tura (ST) seat in November 1989 and instead bring back Purno A Sangma after he had been manoeuvred out of the chief ministership of the State. Sanford Marak who had won the Tura (ST) seat in November 1989 has resigned from the party and is campaigning along with several other notable Congressmen for the candidate of the united opposition, I K Sangma. In these constituencies the death of Rajiv Gandhi and the anticipated 'sympathy wave' might be a factor. In the other constituencies of the north-east, the generally favourable position that the Congress(I) always enjoyed and which had ensured the party candidates' victories again and again will continue to prevail and the death in tragic circumstances of Rajiv Gandhi will neither add to nor take away from what has been the party's traditional areas of strength in the region.

Far difficult as it may be to believe, the Congress(I) in general and Rajiv Gandhi in particular (as indeed the Nehru-Gandhi family members) have always exerted some fascination in the north-east, especially in the peripheral States of the region predominantly inhabited by the tribal people. For one thing, the apparent ease and absence of inhibitions and of hectoring moralising with which these leaders from the Gandhi-Nehru family have generally conducted themselves in public in these regions have made a favourable impression. Secondly, the superficial symbols of 'westernisation' with which these leaders used to cover

themselves, almost ostentatiously as it were, when they were in these regions, further predisposed the people of the region, so avidly attached to the most superficial and ersatz symbols of such 'westernisation', in their favour. The undoubted fascination that Rajiv Gandhi had and the genuine affection in which he was held in the region had more to do with his, and even more so with his family members', personability than with any deeper understanding of the social factors that had contributed to these superficial features.

The sympathy factor is likely to work the least in Assam where even otherwise the politically dominant sections of the Assamese-speaking people have generally cherished anti-Congress, especially anti-Congress(I), views, though even among these sections the personality of Rajiv Gandhi and his near relations roused mixed feelings. This has been evident in the genuine grief that the assassination of Rajiv Gandhi has evoked even among those sections who in October 1984 had gloated over the killing of Indira Gandhi as deserved divine retribution. But the stakes in the present elections, especially to the State assembly, being very high, and with every section of the people very highly politicised, it is unlikely that the 'sympathy vote' will ever be a factor in the

cold calculations already going on. The suspicion that the dismissal of the AGP government (which, despite its many grave failures, was still seen as 'our own' government by these sections whose overthrow should have legitimately been accomplished by the people of the State and not by a caretaker government playing proxy to the Congress(I)) was engineered by the Congress(I) is still too strongly held for the party to make any headway on the so-called sympathy factor.

Above all, there is the ULFA factor, formally committed to a policy of total non-intervention and non-involvement in the election process, though its partiality for the regional parties (whose leaders it constantly denounces in its polemical interventions in the local press) is no great secret. While the organisation is formally banned and its leaders are not able to function with the kind of openness with which they used to before the dismissal of the AGP government, its total antipathy to the Congress(I) (along with the BJP) has been constantly reiterated. Indeed, the directive the ULFA issued some months ago asking members of all-India political parties to formally dissociate themselves from certain parties, or else face condign punishment, explicitly excluded from its ambit parties like the CPI and the IPF while keeping up pressure against the Congress(I) and to a lesser extent the BJP, in the former case going to the extent of killing in broad daylight one of the most non-controversial and popular leaders of the party. With ULFA's views on the Congress(I) being thus so widely known, and with the kind of clout that ULFA has repeatedly demonstrated in the State, it would require something much more than the killing of the president of the Congress(I) for any sympathy wave on behalf of the party to be generated in Assam.

JUST PUBLISHED FOOD INSECURITY AND THE SOCIAL ENVIRONMENT Vol. I: FOOD SYSTEMS AND THE HUMAN ENVIRONMENT

by
BOUDHAYAN CHATTOPADHYAY

This work is the outcome of a thorough research in the Centre for Regional Ecological and Science Studies in Development Alternatives. The first volume of the book (to be completed in two volumes) explores the profiles of food insecurity in Eastern India from the vantage point of the Bengal Famine of 1943 tracing out the vicissitudes of the food system through the post-independence decades. Attention is particularly focussed on micro community profiles of food insecurity including health hazards embedded in the tribe-caste land labour nexus. Attempt is made to combine a degree of sophistication of quantitative analysis with historical insights in which traditions and life style are also explicitly admitted. The second volume is in press.

OXFAM (INDIA) TRUST

REGIONAL REPRESENTATIVES - INDIA

OXFAM has seven regional offices in India, all funding local groups for rural development activities. OXFAM also responds to disaster situations with relief and rehabilitation work. Each office has experienced field and support staff.

We are looking for Representatives for three of the teams, those in Ahmedabad, Calcutta and Bhubaneshwar. They should have at least 3-5 years experience of development work preferably at grassroots level and in India with knowledge of economic, social and political issues in the region. Experience of managing a comparable programme and similar team of staff is important.

We are particularly keen to encourage women to apply for these posts.

Salary under review
Closing date 12th July 1991
Interviews in August in New Delhi

For further details and an application form please write to:

OXFAM (India) TRUST
E-15 Hauz Khas Market, New Delhi - 110 016.

No enquiries over phone or in person please. In order to cut out costs, only shortlisted candidates will be contacted.

Bihar's Dams, Tribals' Woes

Indu Bharti

Sustained people's protest may well result in the stalling of the Koel-Karo project. But several other similar projects continue to be constructed in the State with little concern for the oustees, who are mostly tribals.

THE ministry of environment is reported to have asked the National Hydroelectric Power Corporation (NHPC) to prepare and submit a comprehensive rehabilitation package for the tribals who stand to be displaced by the controversial Koel-Karo project in Bihar. This may well prove to be what the newspapers in Patna have described as 'The Last Nail in Koel-Karo's Coffin'.

The Koel-Karo Project is just one of a number of such projects which are either stalled or are progressing at a snail's pace due to the resistance of those who will be displaced. These include big projects like the Subarnarekha Hydrel Power Project, smaller ones like the Tenughat Power Project and minor ones like the Bhera Water Reservoir Project. Little has been done to rehabilitate the displaced people even economically, let alone socially or culturally. For instance, the Koel-Karo Project. Formulated by the Bihar State Electricity Board (BSEB) in 1973, the project was designed to generate 710 MW of hydel power by damming the waters of the South Koel river and its tributary, North Karo, with a 44-metre high dam near Besia and a 55-metre high dam near Lohajimi. The two reservoirs were to be connected by a 34.7 km canal and giant hydel power stations were to be established in Ranchi and Singhbhum districts. The cost of the project was initially estimated to be Rs 390.4 crore. And considering that the government's own estimates had put the annual cost spiral to be of the order of 10 per cent, the cost of the project would have shot up to Rs 1,000 crore today. According to one estimate, the cost of the project has been increasing by at least Rs 25 lakh per day.

When completed the two dams would have inundated 112 villages in Ranchi, Gumla and Singhbhum districts affecting around 50,000 people from 10,739 families who would have lost 50,000 acres of land, 25-30,000 acres of which belong to cultivators. On the rest exist forests and the 'sarana' (place of worship) and 'sasidiri' (place of cremation) over which the local tribals have traditional and legal rights. According to the Bihar Sampurna Kranti Manch 85 to 90 per cent of those who were affected are tribals. It is this threat of displacement and loss of access

to 'sacred' forest land which has made the tribals oppose the project.

When the project was formulated by the BSEB in 1973 the tribals were kept entirely in the dark. But with the arrival of government officials to begin the process of land acquisition, the tribals rose in spontaneous protest. To give their protest an organised form the tribals of the Karo region formed the 'Jan Sanyojan Samiti' and those of Koel region the 'Jan Sangharsh Samiti'. In 1976 the two organisations merged to form the 'Koel-Karo Jan Sangathan'. The sangathan is not against the project as such. Indeed the memorandum submitted by the sangathan to the government in 1977 states that the tribals are willing to welcome the project provided it is turned into a 'people's project' which is possible only if the displaced are provided 'land-for-land'. But the government was not willing to concede this demand.

Left with no option, the tribals launched a 'Kam Roko Abhiyan' in 1977. Following this a tripartite meeting was

held between the government officials and representatives of the government, and it was decided to undertake a joint socio-economic survey of the displaced. The survey was carried out in two or three villages but later on all the questionnaires disappeared from the government offices. Following this the sangathan submitted a 16-point charter of demands highlighting various facets of the problem of the displaced and their rehabilitation. It demanded total rehabilitation—economic, social and cultural. But rather than talking to the tribals on these demands, the government unilaterally announced the rates of compensation. In 1983 the sangathan proposed to rehabilitate the displaced of two villages as an example. This was also rejected by the administration and the government which were not willing to even consider the question of social and cultural rehabilitation. In July 1984 the Bihar government called out armed police to help the NHPC acquire land and begin work on the project. But the determined opposition of the tribals, particularly the women, forced the government to recall the police.

In the same year the affected tribals filed a writ petition in the Supreme Court against construction of the project without rehabilitating the displaced. The Supreme Court granted a stay on further construction unless adequate rehabilitation measures were announced. At that time the government's rehabilitation

INDO-GERMAN SOCIAL SERVICE SOCIETY.

A National Development Support Non-Government Organisation with its head quarters in New Delhi is looking for :

AN EXECUTIVE DIRECTOR

This is the senior-most position reporting directly to the Governing Body and the ideal person we are looking for will be a dynamic, self-motivated and committed professional who is totally involved in social work.

The incumbent should be above 40 years of age and have minimum 10 years experience in heading an NGO. He must be familiar with and have a good working knowledge of grass-roots development NGOs. Work involves providing linkage between policy set by the Governing Body, translating them into programmes and where necessary developing the infrastructure and execution, overseeing and co-ordination of project support, development and finance.

The appointment is a 5 year contractual with renewal options and carries a minimum salary of Rs 6,000/- p.m. plus DA, Housing, Transport, Provident Fund, Gratuity Children's Education Allowance, Medical assistance and LTA.

Applications giving detailed resume of your experience and achievements should be submitted within 15 days to Post Box No 3037, New Delhi 110003. Please mark the envelope "Executive Director—Special Committee"

package was worth Rs 150 crore involving a rehabilitation cost of Rs 5,000 per family which was grossly inadequate. Now the authorities are ready to pay Rs 20,000 per acre for the best land, which is three times the initial rates announced in 1974.

The tribals' stand was that mere cash compensation was hardly enough to make up for the loss of land, the only source of their livelihood. What was more important for the tribals was that the project proposal involved the inundation of their 'sarani' and 'sasidin' to which they attach great importance. In the meantime, the tribals cut off the road to Lohajimi where work was in progress before the Supreme Court ordered a stay. The tribals did not allow government officials to enter Lohajimi. Outsiders were first screened to check if they were government officials before being allowed to enter Lohajimi.

The case dragged on till 1989 when a revised rehabilitation package was prepared which envisages 'in toto rehabilitation' of the displaced, land and jobs for all, vocational training and financial assistance for those who wanted to be self-employed and afforestation of about 30,000 of the 90,000 hectares of land which comprise the project's catchment area. The Koel-Karo Jan Sangathan has rejected this revised package as it does not deal with the cultural rehabilitation of the displaced.

The environment ministry has directed the authorities to mould the rehabilitation package on the lines of the one approved for Sagar Sarovar Project in Gujarat with the added stipulation that a fresh environment clearance has to be obtained before work begins on the project. This remodeling of the rehabilitation package would involve, according to officials, "an additional burden of Rs 900 crore, which cannot be taken on." And it is this which has made the NHPC lose interest in executing the project.

SUBARNAREKHA PROJECT

But those displaced by other big projects have not been as fortunate as those in the Koel-Karo region. Not only they have been displaced from their land and thus divorced from their only source of livelihood but the implementation of even the meagre rehabilitation schemes announced by the government has been shamefully tardy. And every move of the displaced to seek justice has been met with brute force by the government. The plight of those displaced by the Subarnarekha Multipurpose Project (SMP) is a case in point. Faced with the threat of displacement the tribals of Singhbhum district, have been raising their voice against the project right from its inception. But unlike the protests of the Koel-Karo Jan

Sangathan, protests here have been suppressed with a heavy hand on more than one occasion. On April 30, 1978, the police, in an unprecedented action of firing on the tribals who were on fast, had killed four and arrested 180 others. Four years later, the police arrested the tribal leader Ganga Ram Kajundia who was leading a demonstration of the tribals against the SMP at Challama in Singhbhum district and shot him dead. Cases of beating up of the agitating tribals by the police are of course numerous. Considering that the tribal region of Bihar suffers from endemic water scarcity and droughts, it may appear rather strange that the tribals of Singhbhum district are protesting against the Subarnarekha project which when completed is projected to irrigate large tracts of agricultural land. But on a closer look it becomes clear that the tribals have every reason to oppose the project.

Formulated in 1974 and sanctioned in 1977, the Rs 129 crore World Bank-aided project envisages the building of a dam across the Subarnarekha river at Chandil, and another across its tributary Teha near Kharkai, two barrages near Ganjia and Kharkai, 342 km of canal in Bihar and three attendant reservoirs across the border in Orissa. When completed it was claimed that the Subarnarekha project would solve the twin problems of floods and water scarcity by irrigating 1.6 lakh hectares cultivable land in Singhbhum district of Bihar, 90,000 hectares in Orissa and another 5,000 hectares in West Bengal. From this it would appear, as has been repeatedly claimed by the government officials, that the tribals of Singhbhum district would be the major beneficiary of the Subarnarekha project.

But according to tribal leaders and environmentalists the intensive irrigation being planned through the Subarnarekha project is not suitable for the soil in the Chhotanagpur region. This, they say, would turn the fertile land of Singhbhum into a swamp. What is required, according to them, is a resurrection of the traditional indigenous irrigation system of the region consisting of numerous 'joria', 'talabs', 'bhatar', and 'mahakaiya' which are falling into disuse due to lack of maintenance on the one hand and decreasing rainfall due to depletion of forests on the other. It was with this indigenous system of irrigation that Singhbhum district was able to grow its food requirement even during the disastrous droughts of 1866. But today the same region has become a foodgrain deficit area, though as a government memorandum submitted to the Centre states: "the 17 lakh acre land of Singhbhum should be able to cultivate 7 lakh tonnes of foodgrains going by the

NOTICE

It is hereby notified for the information of the public that The Raymond Woollen Mills Limited proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi under sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969 for approval to the establishment of a new undertaking. Brief particulars of the proposal are as under:

- 1 Name & Address of the Applicant: The Raymond Woollen Mills Limited, Plot No 156/H No 2, Zadgaon Village, Ratnagiri 415 612 (Maharashtra)
- 2 Capital Structure of the Applicant Organisation: Authorised Capital Rs 9000 lacs. Issued and subscribed Capital Rs 3308.25 lacs.
- 3 Management Structure of the Applicant Organisation indicating the names of the Directors including Managing/Wholetime Director and Manager, if any. The Board of Directors consists of: Shri Vijaypat Singhania (Chairman & Managing Director), Shri N J Jhaveri (Nominated of I.C.I.C.I.), Shri Madhupati Singhania, Shri J P Thacker, Shri Devkumar G Aggarwal, Shri Minoo R Shroff, Shri Nana Chudasama, Shri A R Prabhu (Nominated of U.T.), Shri V S Natarajan, Shri Gautam Hari Singhania (Wholetime Director).
- 4 Indicate whether the proposal relates to establishment of a new undertaking or a new unit/division. Proposal relates to establishment of a new undertaking.
- 5 Location of the new undertaking/unit/division: Kakinada East Godavari District Andhra Pradesh.
- 6 Capital structure of proposed undertaking: Not applicable.
- 7 In case the proposal relates to the production, storage, supply, marketing or control of any goods/articles, indicate: i) Names of goods/articles: Hot Briquetted Iron ii) Proposed licensed capacity: 750 000 tons per annum iii) Estimated annual turnover etc.: Rs 375 crores on full operation.
- 8 In case the proposal relates to the provision of any service, state the volume of activity in terms of usual measures, such as value, income, turnover, etc.: Not applicable.
- 9 Cost of the Project: Rs 600 crores (Approx).
- 10 Scheme of finance indicating the amounts to be raised from: Cost of the Project will be met by equity capital, loans from Financial Institutions/Banks/Debentures/Bonds, etc.

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi within 14 days from the date of publication of this Notice, intimating his views on the proposal and indicating the nature of his interest therein.

Dated 28th May, 1991

State's average yield rate which is sufficient to meet the requirement of the people of Singhbhum." Again, tribal leaders cite various government statistics which show that not only has the irrigated area, both in absolute as well as in percentage terms, declined sharply over the years but the cultivable area and foodgrains production have also gone down (Tables 1 and 2). Despite that till the end of the Sixth Plan as many as 41 irrigation projects had been completed in the Chhotanagpur-Santal Parganas region of Bihar at a cost of Rs 191.8 crore. Most of these projects have failed to serve their purpose because they are not suited to the requirements of the hilly terrain here. Whether it is the Roro Canal irrigation project of the Chaibasa district or the Kolabira dam in Gumla district or for that matter the Tapkara dam in the same district, all have failed to provide irrigation for the simple reason that they lie at a level lower than the targeted fields, and the surface is not plain. The Subarnarekha project is going to be another enlarged version of these projects.

All these projects envisage the carriage of water from lower to higher levels whereas the indigenous system of Chhotanagpur comprises storage of rain water in numerous small ponds at places where it falls and then channelling this water to the dam level fields. Because of the thick layers of granite and nites in the surface of these small ponds water is prevented from being absorbed by the pond surface and thus the farmers are able to grow multiple crops—foodgrains, pulses and spices.

To what extent the Subarnarekha pro-

| Year | Cultivators | Agricultural Labourers |
|------|-------------|------------------------|
| 1961 | 618257 | 130375 |
| 1981 | 383623 | 202393 |

ject will be able to meet the irrigation requirement of the Singhbhum district remains to be seen. What is beyond doubt, however, is the fact that the project will alter the course of the river in such a way that the Santhals, Bhumij, Munda, Bhuiyan, Gond, Kharin and other tribals of the Kolhan region who have been using the river waters will no longer be able to do so even as industrial units in and around Jamshedpur and its inhabitant will have access to a daily supply of 40 lakh litres of water. The project is also expected to lead to the establishment of a 10 MW hydel power station near Chandil to cater to the needs of the industries. According to a souvenir published by the 'Teha-Kharkai Bandh Visthapit Sangh', 65.4 crore cubic metre of water out of the 196.3 crore cubic metre dammed at Chandil and 7.3 crore cubic metre out of the 104.3 crore cubic metre dammed at Teha will be supplied to the industrial units in and around Jamshedpur.

When completed, the Subarnarekha project will submerge, as per official figures, 16,980 hectares land at Chandil and another 12,750 hectares near Teha. The Chandil dam will submerge 32 villages fully and 84 villages partially and thus would displace 6,773 families living in the villages of Chandil block. The dam at Teha will submerge 21 villages completely and another 41 partially displacing around 5,600 families. In all, around 70,000 people will be displaced. Further the three reservoirs to be built in Orissa will submerge 21 villages completely and 36 villages partially and will displace 3,247 families in Mayurbhanj district.

Faced with this displacement the tribals have no option but to migrate to different areas of Bihar, Assam and Orissa in search of work in the brick kilns and stone quarries where they are not only exploited in more ways than one but also have to face the wrath of the local goons, an instance of which was the two successive mass rapes of migrant tribal women working in the brick kilns of Jehanabad early last year to scare them away.

OUSTEES' PLIGHT

Though the government makes tall claims about the rehabilitation of the displaced it is a well known fact that implementation of these schemes remains shamefully tardy. In the case of the displaced in the Subarnarekha project, the government has announced that adequate compensation will be given for the land and employment will be provided to at least one member from each displaced family. But as late as 1988, an enquiry committee of the Bihar legislative council found that at least 30 per cent of the displaced had not received any thing by

way of compensation. The committee categorically held that the statistics supplied by the concerned officials about rehabilitation of the displaced was unreliable. It also detected gross irregularities and corruption in the implementation of rehabilitation schemes for the tribals.

The team's report apart, numerous instances of such discrepancies can be cited. Shrawan Bhuiyan of Harsundpur village in Nimdih block of Singhbhum district was given only Rs 7,000 for two tile-roofed houses. He also has a big family consisting of five brothers. Similarly Basudeo Mahapatra of village Kashipur in Nimdih block received just Rs 10,000 for a big tile-roofed house. But a Congress(I) MLA Prabhat Kumar Aditya got an astounding Rs one lakh for a dilapidated house which was lying abandoned for 20 years.

As for providing employment to the displaced, the Xavier Labour Research Institute, Jamshedpur, recently found that the displaced comprised less than 10 per cent of the project's total workforce. Fifty per cent of the posts of lower division clerks in grade III were to be given to displaced persons, but it was found that in only 5 per cent of such jobs were the displaced employed.

The displaced of the Subarnarekha Project are not an exception. Most oustees are condemned to the same plight. Sikadari power project was completed 12 years ago but the oustees are yet to get the promised employment; in Tapkara village of Gumla district a widow has received just Rs 1,200 for five acres of land; another villager could get just Rs 10 though his two-and-a-half acres of land was submerged. A fertiliser plant was established at Sindri 40 years ago but the 28 families who lived in Rohrabandh where Sindri town now exists after having been rehabilitated in the neighbouring Manohartand are again facing the threat of displacement because they have not been given the title deeds to the land. Many among the displaced are yet to get the compensation amount.

Similarly, work began in 1978 at Paraiyhat village in Godda district for the construction of a reservoir and 355 families living in the village were to be displaced by it. But the government list showed only 55 families among the displaced. Agitated at this the tribals stopped work which till date has not been resumed. In some cases the tribals have been given 'land for land'. But mostly the land given has been found to be uncultivable. The displaced families of Palua, Ruani, Dillong, Keshtapur and Kashipur who had been cultivating at least three crops on their land have been given uncultivable land on which they cannot

grow even a single crop, let alone three, and have become paupers.

Though the government has been acquiring land from the tribals for a pittance, it has been filling its coffers by selling or leasing out land in the same locality and in cases even the same land at high prices. For instance, the tribals displaced by the Tenughat Power Project were given compensation at the rate of only Rs 1,200 per acre but the same land was leased out for 90 years at the rate of Rs 20,000 per acre. Similarly, the displaced of the coal mining project of the Central Coal fields (CCL) in Bermo were paid at the rate of Rs 17,000 per acre by the CCL whereas it paid Rs 1.10 lakh per acre for the government land, which it needed to acquire. These are only a few instances of how the tribals are being uprooted in the name of development without being rehabilitated. But as the example of the Koel-Karo project shows, this cannot continue for long.

In this connection the demands of the organisations leading the displaced

people's movement against the big dams in Bihar assumes importance. These organisations had asked the National Front government to formulate a national policy for such projects which would provide for (a) obtaining and incorporating local people's views in the formulation of the project; (b) obtaining people's acceptance of the final project proposal; (c) informing the affected people on various aspects of the project proposal; and (d) for monitoring of the project by the local people. The organisations have also asked the government to formulate a national rehabilitation policy which should provide for (a) the completion of the process of rehabilitation before displacement; (b) the formulation of a rehabilitation package to the satisfaction of the displaced; (c) not only economic but also social and cultural rehabilitation; and, lastly, (d) land-for-land and in addition jobs to at least one member of every displaced family. Needless to say, there has been little progress in these directions either at the Centre or in the State.

members comprising one superintendent, three clerks for office work, three male and three female guards, a cook and a sweeper—which means that there is only one female guard for 57 girls at any given time. According to a report in the *Sakal*, when the reporter visited the school, one of the mentally retarded inmates was preparing chapatis for the evening meal. The official cook comes only in the mornings and hence the evening meal has to be prepared by the girls. Formerly the school used to be in total darkness because the electrical connections were faulty. Now at least the lighting has improved.

Almost every girl in the school has some skin disease. The girls wore soiled clothes. Most of them had close-cropped hair. Some were lying on torn bedsheets; some had defecated on the door of the living room. Many girls had scabies and bad teeth. Right now the condition of four girls is so bad that if they do not get medical aid they will die.

The report of the superintendent about the death of the seven inmates is pitiful. She said that two girls were too weak to be shifted to the government general hospital at Pune while four were shifted to the hospital. The death of these four girls was reported to the local municipal authorities. Suvarna Walvekar died on July 2, 1990 in the general hospital. Anu alias Mukti died on May 30, 1990. Thereafter 19-year old Baby Enake died of heart disease in the school. Ranjana Pandit who had the habit of eating grass and rags and suffered from heart trouble died on December 19, 1990. Her parents did not come to claim her body. Arati was refused admission in the general hospital and she died on January 8, 1991. Nalini Sukhdeo who died on December 3, 1990 was a mongoloid child and had multiple deformities.

Two years back in 1988, one girl had been raped by a male guard who was suspended from services. The Sirur taluka Janata Dal claims that another girl too had been raped, but the superintendent denies this. Though all the above referred girls died on different dates, only the four deaths of Baby, Ranjana, Nalini and Arati were reported to the local municipality and all of them on one day, January 30, 1991.

No women's organisation has cared to enquire into the condition of these hapless mentally retarded girls. The Lions and the Rotarians send sweets on festivals, but beyond that nobody comes to the institution—not even the parents who have not cared to ask for any remedial measures. Who should be held responsible for the pitiful condition of these mentally retarded girls?

Slow Death for Mentally Retarded

Wishvas Rane

A report on the appalling conditions in the Maharashtra government-run school for mentally-retarded girls in Sirur near Pune.

SEVEN girls have died in the last one year in the Maharashtra government's school for mentally retarded girls in Sirur. The school with 57 inmates is managed by the social welfare department of the government since 1965. This is the only registered school for mentally retarded girls in Maharashtra. Sirur is about 35 km from Pune and the school is situated on a four-acre plot about 2 km away from the village. The girls live in two large rooms.

The Sirur taluka Janata Dal has asked for an enquiry into conditions in the school. Even the superintendent of the school agrees that these are pathetic.

Water supply to the school is limited to one hour a day. It is not that Sirur does not have good water supply, but this school, hardly two kilometres away, does not get adequate water. The girls are bathed once in three or four days and that too only after the coming of a nurse in December 1990. Before that the girls were simply herded to the Moti Nallah (a stream) on the Sirur-Bhimashankar Road and bathed in the open. This stream is

also used by truckers to wash their vehicles.

The post of the nurse had remained vacant for nine years, though mentally retarded girls definitely need the help of a qualified nurse. Even the post of a lady medical officer was filled only in December 1990 and the lady doctor comes once or twice a week and examines the girls. No psychiatrist has been appointed since 1970. The school also needs trained teachers to teach the mentally retarded girls but none has been appointed.

The lone doctor who had been working in an honorary capacity for last 21 years resigned in desperation recently. The medicines prescribed were never supplied. His demand that the girls be bathed at least once a week was not heeded. He had thus to remove worms from the infected wounds of the girls. Without a psychiatrist there is hardly any chance of improvement in the mental condition of the inmates. The quality of food supplied is terrible.

The superintendent admitted that seven girls had died during the last year and two had run away. There are eleven staff

A New World Order?

S Nanjundan

Is the 'new world order' a euphemism for Pax Americana or a real attempt to reshape the world order towards a more equitable, more co-operative and more progressive system?

THREE months have passed since the capitulation of Iraq to the Allied forces at the end of February, signifying the nominal completion of Operation Desert Storm. And yet a new world order in the Middle East—not to speak of the rest of the world—is as far away as, or even farther away than, it was before the Gulf war. What is this new world order, touted mainly by Bush and the Americans? What have been the immediate effects of the war? What are the longer-term implications for the Middle East, for the Western world together with its new allies in former communist Eastern Europe, for the developing countries in general and for the United Nations? Finally, is the new world order just a mirage, an euphemism for Pax Americana or a real effort to reshape the world order, towards a more equitable, a more co-operative and a more progressive system, subserving the world's best interests?

WHAT IT IS AND WHAT IT IS NOT

The term itself is not new. Some trace it to Woodrow Wilson at the end of World War I and Winston Churchill at the end of World War II. It is not necessary to go back that far. Certainly the United Nations moved in the mid-seventies—at the peak of non-aligned unity, and Group of 77, plus second world cohesion—from talking about economic development of underdeveloped/developing countries to agreement on international co-operation for implementing a New International Economic Order (NIEO) calling for a more equitable distribution of and access to world resources of capital, technology and raw materials and an accelerated rate of growth of developing countries. Flow of investment resources and transfer of technology on favourable terms, guaranteeing prices of commodities and ensuring markets for them and redistribution of global industrial capacities so that developing countries attained a 25 per cent share in world industrial output by the year 2000 (the so-called Lima Target) were essential elements of NIEO. The Western world, except mainly the Netherlands and Scandinavia, fought hard to concede as little as possible, and no sooner had the cohesion of developing countries and the power of oil and OPEC dissipated by the end of the seventies, the West under the dominant and aggressive

leadership of the United States backtracked successfully, pooh-poohed the NIEO and stalled the North-South dialogue.

Since the beginning of the Reagan era, the United States has asserted vigorously its national interests in the pursuit of its foreign policy bilaterally and in the world fora. This approach has continued throughout the eighties and into the nineties. The benevolence and egalitarianism of the Kennedy-Johnson and Roosevelt era, whether in foreign or in domestic policy, were given up for the rigours and inequities of supply-side economics, the market mechanism, free enterprise and the private sector. American interests were pursued through international agencies controlled by the United States: World Bank/IMF and GATT, rather than those, e.g. UNCTAD, or the United Nations itself, perceived to be dominated by the majority, i.e. the developing countries. The lever of the United States' mandatory contribution to the United Nations and its agencies (assessed at 25 per cent of the budget) was successfully used to exercise *de facto* dominance in the UN and its agencies overtly controlled for a decade and a half by the Group of 77 with the often tacit support of the USSR and the Eastern bloc. To be fair to the United States, its stance was necessitated by its own retrogression in the world economy and the demands of the US Congress for a *quid pro quo* for its large contributions. Since the late eighties, the deterioration in the position of the Soviet bloc, the disruption in the non-aligned bloc, and the inefficiency, nepotism and the lack of independent leadership in the Secretariats of the United Nations and its agencies, have facilitated the new United States approach to the world order.

The domination approach which the USA has practised throughout the eighties reached its zenith in the conduct of policy leading to, during and after the Gulf war. The United Nations Security Council was successfully hijacked and used as an instrument of US policy, because of a combination of unique circumstances which may rarely recur: the precedence accorded to the Russian and Chinese national interests of improving relations with USA over the objective of a more peaceful solution of the Kuwait-Iraq

dispute and the arrogance and tooniness of Saddam Hussein in spurning the good offices of the secretary-general of the UN. President George Bush's new world order is thus the logical outcome of the success of US policy.

While announcing hostilities with Iraq on January 16, Bush outlined the opportunity for building a new world order, where the rule of law governs the conduct of nations and in which a credible United Nations can use its peacekeeping role to fulfil the promise and the vision of the UN's founders. In his 1991 State of the Union message, he called upon the world to fulfil the long-held promise of a new world order, where brutality will go unrewarded and aggression will meet collective resistance. The new world order was more narrowly defined in Bush's speech to the US Congress (March 6) at its invitation to celebrate the total victory over Iraq and the liberation of Kuwait. Here he pleaded for a continuation in peacetime, particularly in the Middle East, of the Allied coalition's co-operative endeavours in the pursuit of war. Four ingredients of the new world order were outlined: (i) settlement of the Arab-Israeli conflict; (ii) collective security arrangements in the region, (iii) arms control, and (iv) reconstruction and development. Though nowhere stated as such, commentators extend the concept of the new world order to settlement of disputes in other parts of the world through the same methods and mechanisms of the US-dominated allied coalition co-operating through the UN. No one, of course dares speak about the NIEO or the North-South dialogue.

OH! WHAT A FOUL WAR

The euphoria over the total and complete victory of the Allies has led not unnaturally to considerable floating about the intrinsic superiority of Western strategy and tactics and belittled the hitherto overestimated capacity of Iraq. The censorship and the propaganda blitz made it possible for the audience in the West to forget the serious misgivings of the Western media even five days before the war ended, i.e. even just before the ground war commenced, about the extent of success of the air blitz which had lasted for more than five weeks and the apprehension that the ground war may be protracted and could inflict heavy losses on both sides. A quagmire, such as in Vietnam, had been feared by some. That the allies had a walk over need not be entirely attributed to their superiority, luck and the absence of enemy strategy should also be given due credit. The fact of the matter is that this was a unique war, like no other war, and unlikely to be replicated in the same manner.

The uniqueness of this war emerges only ex-post and does not detract from the credit due to the Americans for the strategic planning reported to have been begun even before the Iraqi march into Kuwait on August 2, for the mobilisation of the support of the coalition numbering 38 countries, for detailed and painstaking diplomatic legwork and negotiations to obtain support of all the five permanent members of the UN Security Council and a majority of the other 10, for making skilful use of the UN Secretariat in peripheral matters, leaving military strategy and tactics and war policy and conduct of operations almost solely to the USA, for having succeeded in logistics—transporting and putting in place all the equipment, supplies and communications gimmickry needed for the war, including of course 500,000 American and 100,000 other troops and personnel—and for implementing the war plan thoroughly and efficiently, i.e. fighting the textbook war/communications war to photo-finish and ticker-tape victory. This American achievement constitutes in itself the first and major uniqueness of Operation Desert Storm.

That the Americans had almost total support of a large majority of the governments of the world and the Iraqis found themselves severely alone (i.e. no government supported them over Kuwait) is itself unique and unparalleled. Cataclysmic political and economic changes in several parts of the world during the last two years left the United States at this time as the sole superpower. There were nominally 38 members in the allied coalition, but it was principally the United States, the United Kingdom playing a close second fiddle, France participating almost as the Free French did during the second world war. The show was very much Bush (1) and Major (2), similar to Churchill (1) and Roosevelt (2) in the second world war. Germany and Japan, not having yet got over the trauma of the defeat in the second world war even after 45 years played the role of paymasters for the war (in addition to Saudi Arabia and Kuwait).

That the principal victors, USA and UK, could possibly make a financial profit from the war—apart from all the glory—is certainly exceptional, reminding one of the war booties of the colonial era and the middle ages. The American taxpayer may profit to the extent of \$10 billion, the cost to the US being estimated at \$40-45 billion against pledges of contributions from allies of \$50 to \$55 billion. Similar is the case with UK, with of course much smaller sums involved. The first instalments of the contributions to the USA made in January has already resulted in increasing its foreign reserves by \$15.1 billion in the month to reach

\$87.4 billion pitching US to the top of the world forex reserves league next only to Japan, and overtaking Germany and Taiwan, for the first time in several years. No wonder the US dollar is rising over the yen and the mark. Is this an extension of the concept of the mercenary wars fought in Africa not so long ago? The success of the United States this time may well generate competition next time, perhaps the belligerent(s) engaging the Chinese or the Russians to fight for them! India could as well charge full cost plus whenever neighbours, e.g. Maldives (1989), Sri Lanka (1971) request Indian military help to quell internal revolt or attempted *coup d'états*!

The last unique feature of the war which will be mentioned here is its blatant one-sidedness. It was like David and Goliath. Instead of the stone David had all the sophisticated and futuristic weaponry of the computer-communications-space age. Goliath was certainly not taken unawares, but he did not seem to have a strategy at all, not a military strategy at any rate. Iraq's sole dependence on tactics and political deception contributed to its sudden but total defeat within a period of 100 hours after the start of ground fighting. The arrogance and stupidity displayed by the Iraqi leader is unlikely to be repeated in future conflagrations. An enemy without a military strategy, who spurns opportunities provided over a period of six months for a political settlement and who delays tactical withdrawal until too late and who refuses to engage in ground fighting should be rare indeed! Conclusions on the success or validity of allied military strategy and tactics would have to take into account this limitation of unmatched enemy participation in fighting (despite its assessed strength).

IMPACT AND INCIDENCE OF WAR

The impact of the war has been described as apocalypse in Iraq and environmental disaster in Kuwait. Much of the destruction in Iraq is attributed to allied bombing, whose results were not apparent in satellite pictures or purposely not publicised. Some of the destruction is due to Saddam Hussein's scorched earth tactics and mining in the perimeters and deliberate pollution of the seas and setting fire to the oilwells in Kuwait. Apart from Iraq and Kuwait, Jordan has been seriously affected for having borne the brunt of the large refugee movement through the country and for supporting Saddam. No country in the Middle East—except perhaps Iran, Oman and Yemen—has escaped serious financial losses and decline in production and trade. While the oil revenues of Saudi Arabia (UAE and Qatar) increased for a short

period the costs of the war and of payments to the allies increased substantially more. Besides the middle east, the oil importing countries and the countries supplying manpower to Kuwait and Iraq (notably the Indian subcontinent and the Philippines) have suffered severe balance of payment problems.

The effects of the war are still unravelling. The permanent ceasefire is not in place and over 100,000 allied troops are extant in the area south of Basra (at the time of writing, end of March). Rebel groups have been fighting Saddam Hussein; Kurds in the north and Shias in the south. In Kuwait the returning government has met with a hostile opposition and has unsuccessfully tried to contain it by victimising Palestinians. Public services—water, power, sanitation—have not yet been restored in either of the countries. Added to it the food availability situation is severe in Iraq and the burning of 600 oil wells in Kuwait is causing environmental damage over an area extending from the Gulf to the Himalayas (Kashmir).

Some comments may be in order on the factors that may influence the longer-term effects and the shape of the new world order.

Middle East

(a) The region may never be the same again. While Saddam's belated motive of focusing on the Palestine issue did not on the one hand create disruption in the allied ranks, allied success on the other hand may have disadvantaged the Palestinian cause. Even though Bush has given top priority to reaching a lasting solution of the Arab-Israeli question, Israel is not buying the land-for-peace deal, Kuwait and some of the other Arab allies in the coalition display less fervour for the cause because of PLO's open support to Iraq, Syria may do a deal (similar to the Saadat-Begin one on Sinai) with Israel over the Golan Heights, etc. Apart from some lukewarmness from the Arabs who sent troops to fight Iraq, the other Arabs appear to be solidly behind the Palestinians represented by the PLO. The attitude of Iran may be crucial since it could use the lever of release of American and British hostages held in Lebanon for securing solid concessions on Palestine.

(b) As regards continuing military presence in the middle east to ensure collective security, it would appear that the Americans do not want a quagmire, as in Vietnam, and are genuinely anxious for most of their troops to return home as soon as possible. America will have a base in Bahrain with staff officers only, as part of the Central Command headquarters in Florida. Naval presence in the Gulf would continue. A field force for

policing the region would probably be composed of Egyptians, Syrians and Saudis. The Gulf Co-operation Council (GCC) may have a role to play.

(c) Arms supplies to the region (and to other developing countries) will be subject to stricter regulation. Further supplies to five West Asian allies, principally, Israel, Egypt and Saudi Arabia, are taking place under a \$18 billion authorisation. The Soviet Union and China—besides the USA, UK and France—are major armament exporters and their co-operation would be sought in regard to equipment involving application of nuclear, missile and space technology. International agreement to ban chemical warfare and to monitor implementation will be sought.

(d) The hawks in Washington—as an afterthought—would have liked to carry forward the war to annihilate Saddam Hussein and instal a new (military) government. Having achieved a spectacular, if unexpected, victory, Bush rightly called a halt, since the UN had authorised the liberation of Kuwait rather than the elimination of Saddam Hussein or the 'Lebanonisation' of Iraq. US attitude is ambivalent: It would like Saddam to go eventually, after he defeats the rebellions and re-establishes the unity of Iraq. The United States cannot countenance Iranian hegemony over the region; a see-saw between Iran and Iraq would suit Western interests. Back to balance of power than the new world order!

(e) Reconstruction of Kuwait alone is expected to cost \$50 to 100 billion; Kuwait will pay for it with assets and investment income; a grateful country will no doubt award most of the contracts to US firms; subservient Western allies and a humble Japan will be initially content with subcontracts and supply orders. The costs of rebuilding Iraq will be even higher: perhaps China, USSR, Korea, Taiwan, etc, and—after a respectable lapse of time—Japan and Germany and even the UK, will come in. Iraq's reconstruction will be complicated if the onerous terms of reparation and compensation proposed to be exacted by channelling (confiscating?) its oil revenues to a reparation fund are approved and implemented.

Western World

The Gulf war has at one stroke re-established US domination over the OECD group, despite its economic inferiority to Japan and Germany. The latter two are openly chastised for not having taken an active part in the hot war. It is not appreciated that both the countries cannot under their constitutions (not uninfluenced in the past by the US) participate in military conflicts, (in the case of Germany outside NATO region). Had they engaged in physical combat with

any degree of success the media might well have recalled their fighting abilities during 1940-45 and embarrassed them! Japan for instance has not forgotten Hiroshima and Nagasaki, and Kurosawa's latest movie ('Rhapsody in August') is evidence that the nuclear bombing of Japan has not been forgotten, even though the Americans may have been forgiven. Germany is preoccupied with the enormous problems consequent on the merger of its eastern part into the Federal Republic, and Britain is riding high. Nevertheless the common European market will come about by the end of 1992 and the European Monetary Union (EMU) and an European central bank by 1994. What may be delayed considerably is political union, with a central foreign and defence policy. The Gulf War will not mitigate in any way problems between EEC and USA on agricultural subsidies and protection to European industry, transport, services, etc. Problems arising from the liberation of East European countries and possible democratisation of USSR will take at least till the end of this century to sort out. What is clear is that Western European countries will be more involved in assisting in the development of East Europe than in participating actively with the United States in the new world order for collective security in West Asia and the rest of the world.

Third World

The non-aligned movement, already weakened by the break-up of the Second World, has possibly suffered a deathblow through its ineffectiveness in the Gulf crisis. It has not been able to take a unified stand in the UN Security Council, and its attempts to prevent the war were feeble and inconsequential. India and Yugoslavia have been preoccupied with serious internal problems, Egypt and Iraq found themselves on opposite sides. Algeria, Cuba, Oman and Yemen perhaps played a more active role than the other pillars of non-alignment! There is no doubt that the Third World has lost considerable ground, which will affect its cohesion and ability to exercise influence and help itself even in international economic fora, e.g. GATT, UN Agencies. South-south trade and investment have much potential, but *real politik* confines such co-operation to the poorer countries, the oil rich and NICs (first and second generation) looking more to the developed world than to their poorer cousins!

FUTURE OF UNITED NATIONS

Not since Trygve Lie, the first secretary-general of the UN, succumbed to McCarthyism in the fifties, has the UN come under virtual subjugation of the United States, as it did during the Gulf

war. The first reaction of Pérez de Cuellar, when Iraq invaded Kuwait on August 2 was, as reported by the media, that it was a regional problem to be tackled by the Arab League. It was undoubtedly an off-the-cuff remark and the secretary-general did undertake active negotiations in Baghdad. Nevertheless, the fact of the matter is that the UN Secretariat as such was sidelined, the US taking over as the leader of the permanent five of the Security Council. Even the mundane information and public relations functions were not assigned to the UN, not to speak of the more important monitoring function. It is stated in extenuation that the UN provided the legal basis for the war, through its resolutions, and that, in any case, the UN has no teeth—the Military Staff Committee is dormant or nonexistent and the UN has no forces or funds of its own. No one recalls the active and positive role of the UN in Korea (1950-51) and Congo (1960-61); but that was in a bipolar or multipolar world. The UN perhaps should henceforth be engaged only in post-peacekeeping and humanitarian work, at the behest of the sole superpower!

It is not argued here that the UN was in a fit state of capability to play an active role. Dag Hammarskjöld was perhaps the only secretary-general who had a concept of the independent role of the secretariat. But until recently there was a kind of balance within the organs of the UN provided by the countervailing interests of the First, Second and the Third Worlds, and the secretariat was made use of as a sort of impartial instrument for action. It is now recognised that the UN Charter, organisation and operating methods need considerable revision and restructuring to ensure effectiveness and a useful role for it in the emerging new world. This is a large and complicated subject in itself. However, it is worth mentioning that the reforms being suggested include: (a) expanding membership of the Security Council from the present 15 to 25—10 permanent and 15 others, to be more representative of the enlarged membership and relative economic strength of members, compared to 1945, when the present structure was adopted. Max Jakobson, a Finnish diplomat with long experience of the UN from the time the Charter was signed in 1945, suggests the addition of Germany, Japan, India, Brazil and Nigeria to the current permanent membership of the USA, the USSR, the UK, China and France, and of course the periodic election of the remaining 15 by the UN General Assembly; (b) Reconstitution of the Military Staff Committee and a permanent UN force pledged by permanent members of Security Council and kept in

a state of preparedness, (c) Criteria and procedures to ensure selection and appointment of an outstanding individual of high calibre and unimpeachable integrity as UN secretary-general for a single term of 7 to 8 years, (d) placing a substantial trust fund at the disposal of the secretary-general to enable speedy action on peacekeeping activities, (e) Strengthening regional collective security bodies (e.g. ECOWAS action in Liberia), (f) Ruthlessly weeding out so-called specialised agencies and relying increasingly on regional and subregional groupings—already existing—directly linked to UN regional commissions and the United Nations Development Programme. Some existing specialised agencies, e.g. on population, environment, industry shipping, etc. could be converted to non intergovernmental bodies, working as research and development institutes financed by grants and consultant services provided by them.

US HEGEMONY UNLIKELY

Despite the facade of sanctions and repeated ultimatums to prevent the hot war, it would appear that the Americans had decided quite early on in August or even before that (USA UAE military exercises in the region) to take decisive military action to curb Saddam Hussein's growing dominance. That aggression against an independent country and violation of its sovereignty should not go unpunished and a likely threat to Saudi Arabia prevented were certainly important considerations. While sanctions and negotiations could conceivably solve these problems, they would leave Iraq's military machine virtually intact. However, the US was as much to blame as the USSR earlier for having wooed and encouraged Saddam Hussein and having armed the country, against the perceived menace of Shia fundamentalism represented by Iran. As the evidence to Congress of the then US ambassador to Iraq makes it clear, at least the State Department felt even a week before August 2 that the Iraq Kuwait dispute was an Arab Arab problem to be solved by the Arabs themselves and not through Iraqi aggression. While Saudi Arabia—one power which has the US ear—might have suggested military action to finish off or reduce the might of Iraq, Bush and his closest foreign and defence policy advisers clearly perceived that American interests necessitated planning of military action to ensure a significant victory for America. What were these American interests? Most important, of course, was to ensure US influence and control over oil supplies and prices. Two-thirds of global oil reserves are in the Gulf, and the US imports half its oil requirements increasingly from the Gulf region.

(The moves towards US-Canada-Mexico free trade area and proposals for a tax on imports of oil from outside the continent are also meant to promote self-reliance). Other motivations in the pursuit of the war were to exorcise the Vietnam syndrome of defeatism, to establish American dominance despite its international economic retrogression, and to provide an escapism from tackling head-on serious domestic problems of the economy, budget balance of payments, crime, drugs, education, health and poverty. The US has been remarkably successful in achieving its immediate aims: the US appears as the only superpower dominating the international scenario, the recession has been halted and the dollar has been gaining over the mark and the yen, Bush can look forward to the 1992 election with confidence, etc. The Vietnam syndrome has been replaced by the Iraq euphoria and, despite the paranoia all around Bush, he is unlikely to get involved in an Iraqi quagmire. It is important for his election campaign that the remaining 100,000 or so American troops return home alive and soon.

The hawks and some of the media are already accusing Bush of a 'reversal' in not coming to the help of the Kurds and Shias, and in not overthrowing Saddam Hussein. Bush is no doubt influenced by the Saudi fears of Iranian and Shia domination of the Gulf. But he also has American interests very much in mind. Domestically further involvement (and American casualties) will strengthen the peace movement and the Democrats, the allies will not continue to be paymasters for the war (note the opposition and difficulties in Japan and Germany to the contributions already made). Moreover the American tradition since its own civil war of over 100 years ago is not to countenance dismemberment and secession in sovereign countries, be it Iraq or Yugoslavia or the USSR. (This tradition largely accounted for US hostility to India over Bangladesh in 1971. For this reason the US is unlikely to encourage S S Mann over Punjab.)

The limits to American 'superpowerdom' are becoming apparent even a month after the great victory. Not only that, military power has to be backed by economic power. The US does not have the 'stomach' to be an imperialistic, hegemonistic power. It is too moralistic, too democratic, too freedom loving (for itself and for others), too naive, too open (qualities which have endeared it to the rest of the world, as no other country has endeared itself), to be ruthless in the pursuit of hegemonism. What then is to become of the new world order?

The likely scenario in the medium term or even the short term might be one of

changing balance of power rather than Bush's new world order. Except for the ever-loyal British under the Conservatives, the other middle powers and potential superpowers are unlikely to tolerate a permanent leadership or domination of the US. Besides the US itself the principal actors in a shifting power balance would be: the European economic community (co-ordinated foreign and defence policy worked out largely by Germany, France and Britain), the Soviet Union, China and Japan. The Third World is unlikely to have any significant influence, except by individual countries or regional/subregional groups combining with one or more of the principal actors. *Plus ça change, plus c'est la même chose!*

INDIA AND NEW WORLD ORDER

That India played no part whatsoever in the discussions and negotiations before, during and after the Gulf war (except for the consular function of taking care of its nationals in the affected areas) reflects not only the petty minded squabbles in Delhi (ignoring national interest), but also the country's retrogression as a political and economic power. Moreover the mediocrity (and the premature gerontocracy) of the Indian foreign service establishment is in sharp contrast to the scintillating dynamism displayed in particular by young Arab diplomats representing countries in the allied coalition and against it.

There is, however, no getting away from the fact that India is a country large enough to matter, it cannot be wished away its positive and dynamic role in international affairs from the fifties to the seventies have ensured for it a potential role an opportunity which needs to be grappled and used wisely to serve its permanent interests. It will not be an easy task, it will have to be preceded and accompanied by genuinely directed efforts to bring the internal house in order, to concentrate on domestic measures (constitutional, political, economic and social), to promote self-reliance and to display positive leadership in the region. If the Gulf war has a lesson for India it is 'not to put all the eggs in one basket' and not to neglect to continuously monitor and take timely corrective action to secure its interests. Most importantly, in this writer's view, India has increasingly to look east—towards China, Japan, south-east Asia and the Far East—rather than be obsessed by its West—i.e. not only Europe (including USSR), and the USA, but also West Asia. It will be a difficult turnaround, in view of past links and obsessions, but it will have to be made to serve its interests. Such approaches need long term planning and systematic implementation and not *ad hocism* and day-to-day decisions.

'Too Late, Too Little'

S R Sen

Non-resident Indians in business or service, while working in other countries, are second to none in efficiency, but in their own country they are usually frustrated by the 'too late, too little' syndrome. Why?

RECENTLY there was a news report that a leading Indian company lost a Rs 2,000 crore joint venture bid in a foreign country because the government of India's sanction required for it came too late and was too little. The chairman of the company lamented "the loss of the project was that of the country and not the company's alone".

Another respected Indian industrialist complained that while it took him only six months to set up factories in East Asian countries, it usually took three to four years to do the same in India.

Non-resident Indians in business or service are second to none in efficiency while working in other countries but in their mother country they are usually frustrated with the 'too late, too little' syndrome.

Some years back a South Korean minister came to India to study Indian economic policy and planning. At the end of his visit when he was asked what he had learnt his reply was devastating. "I learnt what not to do." He went on to say "in India you use the rein too much to control the horse which is ready to gallop. In South Korea we also use the rein but mainly to guide the horse gently in the desired direction. 'Too late, too little' were the very words that he had also used to describe the Indian decision making process."

This observation seems to be true not only of India and South Korea but also of the comparative situation in South Asian countries and Pacific Asian countries in general, of course in varying degrees.

A visiting Japanese businessman made a similar observation and added "To businessmen, time lost is money lost. But to government and trade union officials in South Asia, time lost does not appear to be money lost."

Some commentators have ascribed this to differences in work ethics. But as mentioned above, Indians or Pakistanis working abroad do not compare unfavourably with Chinese or Koreans.

Others have cited relative per capita foreign aid, but that to India or Pakistan does not compare unfavourably with that to China or South Korea respectively.

Some have sought to make it an issue of command economy versus market

economy. But in spite of all the recent liberalisation, there is still much more of a command economy in China than in India. In South Korea, Taiwan, Thailand and even Japan, there is a large element of state guidance or regulation. All of these are really mixed economies of one sort or the other. Certainly not text book *laissez faire* economies.

Why is it then that the phenomenon of 'too late, too little' is so much stronger in South Asia as compared to the Pacific Asia region?

BUREAUCRATIC SYSTEM

One important reason seems to be that the bureaucratic system common to the South Asian countries is significantly different from that obtaining in the Pacific Asian countries. It is just not the size of the bureaucracy. There are large bureaucracies, of indigenous origin, in some of the Pacific Asian countries also. The Mandarin system of China abolished during the revolution seems to be coming back again in a different form. In Japan and South Korea the bureaucratic system is undoubtedly different from China and Taiwan, but is quite important.

In Hong Kong and Singapore, the system of bureaucracy owes its origin to the British but is significantly different from that obtaining in India, Pakistan and Bangladesh and closer to that obtaining in Britain than in the former British empire in the sub-continent and is significantly less rule bound, structured and rigid. The bureaucracies of some other Pacific Asian countries are even less so.

There is an important historical reason for these differences. In Singapore and Hong Kong the system that obtained in Britain was largely replicated because these were relatively small countries, it included a larger proportion of British officials even in junior posts and the discretionary powers and flexibility which characterised the British bureaucracy were introduced in these former colonies also.

But the Indian sub-continent was a quite different matter. The British ruled the teeming millions of this vast region with only a small number of highly paid British ICS and other officers. They had to manage with the help of hundreds of

thousands of low paid locally recruited subordinate staff, whom they basically distrusted, especially after the Sepoy War of 1857. So they made a basic departure from the system that obtained in Britain. The British bureaucracy was based on mutual trust between the senior and junior officers and had more discretionary powers and flexibility. The British Indian bureaucracy was based, on the one hand, on close comradeship among the British officers but, on the other, on considerable distance and distrust between the senior British and junior Indian officers. The system devised was such that if there was a need for a change from the *status quo* in a special situation, several Indian officers had to say 'yes' before it could be implemented. But it was sufficient for only one Indian officer to say 'no' for the proposal to be stalled. Only a senior British officer (or trusted Indian member of the ICS in the later years) could over-rule him. The British officers could take bold and prompt decisions, firstly because they could consult their other concerned compatriots very informally and quickly, if necessary, and secondly because they were confident of support from their political boss, the British governor or viceroy. But the subordinate Indian officers did not have that advantage. Therefore, whenever an innovative action was called for they tended to delay decision or opt for minimum change.

This system was economic, quite efficient and free of corruption (except for the equivalent of tips at the lowest levels) and worked reasonably well in normal times and so long as maintenance of the *status quo* (mainly law and order) was the main task. But when it came to changing the *status quo* or economic development, it was found wanting even when the British were here.

WORLD WAR II

During World War II, especially after the Japanese attack and the 1943 famine, emerging compulsions of the situation led to a rapid multiplication of various controls. But most of these were introduced in *ad hoc* manner without careful consideration of the pros and cons and long-term consequences on the ground that these were only temporary measures to be terminated soon after the end of the war.

But this did not happen partly because the shortages and inflation continued even after the war was over. Gandhiji was strongly opposed to the continuation of most of these controls because they were being misused by some vested interests among both officials and businessmen, resulting in widespread corruption.

When Rajendra Prasad became

minister of food and agriculture, Gandhiji requested him to dismantle or at least to simplify the system of controls so far as his own ministry was concerned. But by that time prime minister Nehru had made up his mind to introduce planning for rapid and balanced development of the economy. He decided that as controls were essential for planned development, the system of controls which already existed should be continued. Rajendra Prasad failed to carry out Gandhiji's mandate. Shortly before his death, Gandhiji wrote a brief letter to Rajendra Prasad expressing great disappointment at his failure. Later several senior ministers like Sardar Patel, Rajagopalachari, K M Munshi and Rafi Ahmed Kidwai tried to follow up Gandhiji's mandate and relax, if not remove, some of these controls.

REGIME OF PLANNING

But by that time planning and controls had received enthusiastic support from parliament. Unwittingly, this played into the hands of those politicians and officials who enjoyed the power that controls gave them and those businessmen who benefited from these controls. If the haphazard system of war-time controls had been replaced by a new system of purposefully designed controls needed for planned development, it might have better served the objectives of the Plans. But that kind of rationalisation did not happen. The base of war-time controls was retained and on top of that were piled up additional layers of new controls as fresh problems arose, without significantly changing, not to speak of weeding out, unnecessary or counter-productive controls. The jungle became increasingly full of obstructive bushes and creepers.

Pandit Nehru himself and some of his successors later expressed their unhappiness at this turn of events. Several committees and commissions, starting with the Krishnamurthi Committee of 1951, were appointed to rationalise and simplify the mounting number of controls but in vain. Only the less important of their recommendations, which did not adversely affect the powerful vested interests of politicians, officials and businessmen, got accepted and implemented. But the more important recommendations which sought to curb these vested interests were either not accepted or, if accepted, were not implemented. Like the mythological Hydra which grew a new limb whenever an old limb was cut off, when one of the controls having support of powerful vested interests was abolished as per these recommendations, a replacement in a new garb was soon introduced to take its place.

To deal with this kind of situation, the Sarkaria Commission made *inter alia* the following recommendations: "As a mandatory legal requirement, there should be periodical review, say, every three years,

to determine whether in respect of any of the industries the Union's control should be continued or relaxed or lifted. Such a review may be undertaken by a committee of experts... In the context of undue delays in industrial approvals, a useful corrective may be to appoint an 'Empowered Committee' for taking a final decision, subject to a sort of 'sun-set' rule that if any link or agency does not give its comments by the due date, the committee will take a decision without waiting for it."

More than 3½ years have passed, but even such a modest recommendation is still gathering dust. This is cited only to show how difficult it is to bring about any simplification or rationalisation, not to speak of clearing, of the jungle of controls, relevant rules and dilatory practices that have grown up in India over the last five decades. If this jungle is to be prevented from further entrapping the economy and gradually cleared to become a productive garden, it is urgent to implement the above noted recommendations of the Sarkaria Commission and, further, to legislate that all controls, related rules, etc, not specifically recommended for continuation by the committee of experts will automatically lapse at the end of three years.

CORRUPTION

Today the maze of controls and related rules, etc, have become so complex and some of them even contradictory that transparency has been lost. Very few people know what is the latest correct position.

A corrupt official often takes advantage of this and delays decision by citing some sub-rule when so-called 'speed money' or 'consideration money' is not paid and expedites decision by citing some other sub-rule, if necessary, when such money is paid. This is often responsible for the 'too late' phenomenon.

Further, to safeguard his position against a possible charge that he has not been careful enough in giving approval, he sometimes makes an arbitrary cut in the sanction asked for. This is partly the reason for the 'too little' phenomenon.

In view of the growing need for huge amounts of money needed to contest elections, the political bosses sometimes not only connive at this but even instigate this. And as an Indian proverb says: if the king takes by unfair means a cup of milk, his officials take a tank full.

TRADE UNIONS

As the Japanese businessman quoted earlier pointed out, the inefficiency of the sub-continent's economy has been aggravated by another legacy of the British, namely, the 'trade union' system which is quite different from the Japanese 'company union' system. The Japanese workers

are not basically less particular about their rights and dues than their counterparts in India. But in the company union system that obtains in Japan, there is no introduction of extraneous politics, the sole focus is on the income of the company, the workers' share in it and their terms of service and working conditions. But in the trade union system that obtains in India, considerations like the income of the company, the workers' share in it, etc, are often over-shadowed by extraneous politics introduced by the union officials, sometimes oblivious of the direct interests of the company and its employees, and this often creates counter-productive conflict and loss of valuable time and income.

Now that the trade union system has been extended from companies to government offices in some States in India, the situation has become much worse. The 'soft state' or 'soft society' that Gunnar Myrdal had written about two decades back has been further extended, leading to growing inefficiency.

TWO MINIMUM REFORMS NEEDED

Pandit Nehru had the fond hope that a mixed economy, a mixture of a command economy and a market economy, will enable India to avoid the excesses of capitalism and communism, somewhat like Gunnar Myrdal's own country, Sweden.

There are several reasons why it did not work out that way. Unfortunately, it is not possible to go into all of them in a short article.

But one basic fact can no longer be ignored—the counter-productive combination of bureaucratic and trade union systems, originally introduced by the former British rulers and continued unreformed even after Independence, has made a major contribution to the failure of our experiment with mixed economy in a social democracy.

There is now an urgent need to recognise clearly this fact and take comprehensive reform measures after careful analysis. But pending that, at least two bold but relatively simple measures for dealing with the evil of 'too late, too little' syndrome need to be taken immediately. These are

(i) to enforce mandatory review and rationalisation of all controls and an effective 'sun-set' rule every three years as suggested above; and

(ii) to replace our trade union law borrowed from Britain by a company union law somewhat on the Japanese model, if possible with the one-company one-union rule.

It is only thereafter that the economy of India will be able to reach the efficiency of Pacific Asian countries and generate sufficient income to emulate the equitable social democracy of the Scandinavian countries.

Multinational Affiliates in India

Why Are They Different from Indian Firms?

Sebastian Morris

Multinational Enterprises in India—Industrial Distribution, Characteristics and Performance by Nagesh Kumar, Routledge, London and New York, 1990, pp x + 141

THIS study is conceived within the 'eclectic' paradigm of Kindleberger, Dunning and others. It shows that transnational affiliates in India may not be intrinsically better performers than indigenous firms, but that their niche is altogether different, which perhaps helps them to earn at higher rates of profit. It also attempts to uphold the 'eclectic' paradigm by showing that the industry pattern of foreign direct investment and licensing intensities, in the private corporate sector, are as expected. A rather close adherence to this mainstream paradigm severely limits the scope of the study, and also makes the results, even when they are clothed with much statistical rigour, rather tenuous.

The book addresses itself to the behavioural and other differences between transnational affiliated and local firms and is timely. It is a revised version of the author's doctoral dissertation. After a brief discussion of government policy towards Foreign Direct Investment (FDI) (since independence up to 1987 or so) and a summary presentation of the overall and sectoral shares of FDI, it goes on to: (1) Explain the inter industry variation in FDI and in licensing of technology from abroad, in the process testing the 'eclectic' paradigm which owes its origin to Stephen Hymer¹ for and to further refinements and extensions by Kindleberger,² Cavus³ and Dunning⁴; (2) Identify the characteristics that discriminate between INC affiliates and Indian firms; (3) Explain the higher profitability of INC affiliates in terms of their strategic difference; (4) Explain the export propensities of the two groups of firms. In the analysis for (1), (3) and (4), multiple regression techniques with defined proxy variables to represent the factors required by the theory are used. For (2), besides the analysis of discriminating variables one at a time, a discriminant score function is also used. In much of the analysis the logarithms of the variables are used. As we shall see the analysis though done rather competently and systematically does suffer from the usual problems with statistical analysis and the use of proxy variables. The data pertains to over 1,300 medium and large manufacturing firms⁵ reduced to about 49-odd industries at a near-three-digit level of aggregation. We will also, briefly, bring out the limitations in this study that arise due to an uncritical adherence to the 'eclectic' paradigm. There is little justification provided for the acceptance of the paradigm.

It must also be mentioned that the author seems to be simultaneously testing the paradigm and using it as well.

In chapter I the changing policy towards FDI is discussed and related to the trends in FDI. The source wise diversification of FDI that started with independence and observed for the period till the early seventies by Chandra,⁶ continued into the seventies. Similarly, the increasing importance of the manufacturing sector. The chapter explains the time trend in FDI entirely in terms of changing government policy. Early phase of liberal policy up to 1967, a policy of restriction between 1968 and 1979 and the liberal policies again in the eighties. But we must remember that these periods also correspond to the periods of higher industrial growth up to 1964-65, a period of slow growth or (relative) stagnation up to 1979 and again high growth in the eighties. Empirical evidence particularly in the context of the post war European recovery and fast growth would indicate as Scrivan Schreiber⁸ observed that FDI rather than being an engine of growth may very well be attracted by growth. If the very inward force for FDI in the form of good growth was lacking in India since the mid sixties right up to 1979 then a discussion which is entirely restricted to policies that narrowly relate to FDI, which can at best control and channel the direction of this force and only partly contribute to it, would necessarily be incomplete.

Chapter II of the book tests the 'eclectic' theory through two multiple regressions. In the first the logarithm of the share of foreign affiliates averaged over a three year period (1978-79 to 1980-81) in total industry sales (FS) is regressed on the logarithm of several variables, which ought to according to the theory explain FDI viz. the several intangible assets such as product differentiation and the associated goodwill (ADS: advertising expenditure/sales), knowledge embodied in machinery (PMS: gross value of plant and machinery to net sales ratio), access to capital (AKR: total capital employed per firm in the industry, averaged over three years), and locational factors such as import substitution prospects (ISP: Imports to local production ratios in 1960-61), effective protection rates (LRP: effective rates of protection, for the year 1979-80, by Corden method), whether or not the industry belongs to the consumer goods sector (DCON: dummy), whether or not the in-

dustry was included in Schedule I of the Industrial Policy of the government of India (Decisions), 1973, (DCORE: dummy) and technological intensity/innovativeness (RDS: R and D expenditure as proportion of sales).

The same factors were considered for the second regression which seeks to explain the variation in the licensing intensity (LS) across industries. Licensing intensity is represented by the total royalties, technical and other professional fees paid abroad as a proportion of the net industry sales averaged over the same three year period. Proxy variables are used to represent the factors. Thus technological intensity/innovativeness is represented by RDS, or the possession of knowledge embodied in skills is represented by non-production workers as a proportion of total workforce (SKILL 1) and by earnings of high salaried employees (i.e. those receiving Rs 3,000 per month) as a proportion of the total wages and salaries bill (SKILL 2), the choice between the two being determined at the level of the regression in the step-wise selection so as to give higher R², and similarly for other factors. The factors are themselves selected on the basis of an a priori understanding derived from the theory. The intangible assets are classified into those with higher transaction costs such as goodwill, knowledge embodied in skills, and those with low transactions cost such as knowledge embodied in capital goods, and access to sources of capital. The expectation is that the latter factors would be positively related to licensing and the former to FDI intensity. The obtained R²s range from about 0.45 to 0.60 and the F-statistic for the models from 5.75 to 10.17.

The following models are arrived at with a 90 per cent level of significance or better. (The signs show the nature of dependence, and the figures the significance level)

- FS: ADS (+, .95 per cent), SKILL 2 (+, .99 per cent), RDS (-, .99 per cent), DCON (-, .99 per cent)
 ADS (+, .90 per cent), SKILL 2 (+, .99 per cent), RDS (-, .99 per cent), DCON (-, .99 per cent)
 ADS (+, .95 per cent), SKILL 1 (+, .90 per cent), RDS (-, .95 per cent), ISP (+, .95 per cent)
 LS: RDS (+, .99 per cent), DCORE (+, .99 per cent)
 PMS (+, .95 per cent), RDS (+, .99 per cent), DCORE (+, .99 per cent)

A preliminary correlation matrix of all the variables revealed that the correlation coefficient between FS and LS was low, and the conclusion is drawn that the phenomenon of FDI and pure technology import (licensing) are independent, thereby justifying independent regressions (and models) for these variables.

From the obtained models the author concludes that the 'eclectic' paradigm is upheld

intangible assets such as goodwill built up through advertising, and knowledge embodied in human skills (what the author calls idiosyncratic knowledge), which are not easily commercialised, while licensing is explained by knowledge embodied in plant and machinery (PMS), an intangible asset that is easily transferred along with the plant and machinery; and the locational factor whether or not the industry is included in the set of 'core' or priority industries (DCORE).

The unexpected negative relationship between FDI intensity and research and development expenditure (RDS) is rationalised by reference to Desai's⁹ finding that the R and D expenditure in much of Indian industry is adaptive rather than of a more basic type, hence RDS according to the author does not reflect technological sophistication, nay increasing RDS implies decreasing technological sophistication!

Similarly, the negative coefficient of DCON (whether or not the industry produces consumer goods), is explained by the governments' policy which discouraged investments in consumer goods industries. It is difficult not to feel that the interpretations are more in the nature of ex post rationalisations of the obtained models. Thus, while it may very well be true that some or much of the R and D is of an adaptive type, it does not warrant the author's statement that as the complexity of the technology increases, the tendency to adapt decreases.

We would, instead of ascribing any perverse relationship between technological sophistication and R and D intensity, simply accept the finding of lower R and D intensity for foreign firms. This is hardly unexpected: Briefly R and D is an activity that demands great centrality within organisations and is typically located at or near the headquarters of a firm or at a location under the direct control of the corporate office. In other words it is very much the type I activity of Stephen Hymer¹⁰ and there is little reason to expect transnational affiliates in LDCs, which are much more in the nature of branch/sub-branch offices or plant/sub-plants to house an important higher order function like R and D.¹¹

We would claim that the negative coefficient of RDS neither supports nor questions the 'eclectic' paradigm. It merely confirms that R and D is very much a type I activity and necessarily gets concentrated in the parent firms' country of origin.

The negative coefficient of DCON (dummy whether or not an industry producing consumer goods) is explained by the government policy that sought to avoid foreign investment in areas where local skills and technology was available and the high overlap between these and the consumer goods sector. This could very well be true but the assumption of the high overlap between consumer goods and sectors with local availability of skills and technology needs to be proved. More importantly given the fact that the barriers due to product differen-

tened in consumer goods, particularly in life style associated products, the variable ADS X DCON should have been used in the regression. Then, the hypothesis of product differentiation as an intangible asset creating entry barriers for local firms could have been tested. This is particularly important in the context of Western direct investment in an LDC.

In an LDC given the social process of Westernisation, Western brand names have an advantage that is intrinsic to its origin, independent of advertising intensities. This is because Westernisation implies *inter alia* the imitation of life styles of Western people by the urbanised upper classes in LDCs, who in turn constitute models for the rest of the population. The desire to acquire and use Western products does transcend the product as such and becomes one of using and acquiring certain brands, since these are perceived to be of higher quality and the 'real thing'. The advantage is particularly strong in life style-associated products. Indirect tentative evidence that this is so is provided by the fact that the advertising and promotion intensity of life styles associated products and other products like drugs and pharmaceuticals is high for successful Indian firms compared to transnational affiliated firms with similar market shares and catering to the same market segments. Apparently they have to overcome this social disadvantage. It is remarkable that the 'eclectic' theory has not recognised this special advantage that Western firms enjoy, which is entirely external to the firm.

The variables that most explain the variation in FDI intensity are SKILL 1 and SKILL 2 which are themselves highly correlated so that the models use only one of them. This is argued to support the 'eclectic' paradigm which explains FDI intensity in terms of the possession of intangible assets that are transacted, if at all with only high cost. While the 'eclectic' theory could very well be true, the nature of the proxy variables used to represent skills embodied in people viz, SKILL 1 and SKILL 2 are problematic. It is important to remember that statistical analysis does not lead us to an understanding of causation. It is only the a priori acceptance of SKILL 1 and SKILL 2 as representing skills and knowledge embodied in people that the author is able to claim the validity of the 'eclectic' theory. But given a different understanding of the behaviour of transnational affiliates in India the causation could very well be from the 'dependent' variable to the 'independent', i.e. SKILL 1 and SKILL 2.

HIGH INCOMES IN TNCs

From this book as well as from the earlier literature¹² we do know that the transnational affiliates make profits much larger than that of Indian firms, whatever the reasons. We also know that in foreign firms in India, as also in some of the large highly

the former, wage rates for the same jobs are high. Indeed if one were to go through the annual reports of these firms then in the appendix to the same, one cannot escape noticing that among the highly paid employees are a great number of stenotypists, secretaries, drivers and other workers, who in other (Indian) companies could be earning much less.¹³ In other words TNC affiliates may be paying more simply because they can afford to do so. Nevertheless the question 'How do TNC affiliates maintain these high profits and wage rates?' remains, and the author has rightly made the determinants of profitability an important focus of his analysis.

Of all the characteristics of market structure, as a priori obtained from the industrial economics' structure-conduct-performance paradigm, and from a prior knowledge of the particular aspect of the industrial environment in India, (viz, scale, advertising intensity, R and D intensity, profit margins, and growth rate of the industry), only larger scale of operations (measured by average net sales per firm) and higher profits margins (on sales), and the use of highly paid labour were found to distinguish between the two groups.

The fact that advertising intensity is not as per expectations is explained away by saying that 'they might, however, still enjoy an edge over their counterparts [local firms] in this respect, on account of the advertising generated by the associate companies and of the economies of scale in advertising'.¹⁴ While the reason that there may be economies of scale in advertising is quite possible, why should significant benefits emerge from the parent company's advertising in other countries? More likely, the environmental advantage of Westernisation in LDCs which we have stressed earlier explains the fact that the local firms have higher advertising intensity than foreign affiliates which helps them to overcome the same. The only other significant difference the author finds is the liquidity ratio which is better for TNC affiliates.

The major factors in the discrimination appears to be the same that explained the FDI intensity, viz, proportion of high income employees HIE (same as SKILL 2 of the earlier analysis of FS and LS), which is in turn highly correlated with SKILL 1 and FS. Through a further two-stage regression the major discriminator ultimately reduces to SKILL 1. This finding is again explained: 'The proportion of high income employees in the case of [affiliates of transnationals] thus appears to be on account of their tendency to employ qualitatively superior personnel than their local counterparts... [which] may be an aspect of the non-price rivalry and may lend them a formidable competitive advantage in skill intensive industries and can be a source of contrived entry barrier'.¹⁵ But as suggested earlier, it is most likely that the cause of this use of highly paid labour is their high profitabili-

ty and the ability to maintain the same. Furthermore the 'explanation' of the differential profits again in terms of essentially the same variables used in the discriminant analysis and again the emergence of 'skill' as the principal factor explaining profit levels makes the total explanation circular:

In chapter V an attempt is made to regress profit levels on variables which include some of those already used in the earlier analysis the product of advertising intensity and whether or not the country purchases consumer goods (ADS X DCON), technological intensity which is the R and D intensity and the cost of imported technology, SKILL 1 and SKILL 2, total capital employed per firm, value added/sales, four firm concentration ratios, growth rate of sales, size (represented by net sales per firm), capital intensity, and effective protection rates. The attempt is to arrive at functions for the profit margins of local and TNC affiliates separately and then test whether and in what form they are different. The analysis leads to the rejection of the hypothesis that TNCs have superior ability (because the intercepts of the regression equations are not significantly different). The competing hypothesis, that they belong to different strategic groups as represented by the varying coefficients of discriminating characteristics is upheld. That TNCs and local affiliates show different behavioural characteristics (whether or not one demarcates them into different strategic groups) is an important conclusion arrived at. Yet the further elaboration offered: 'In knowledge intensive industries FCEs [transnational affiliates] appear to enjoy special advantages over the local counterparts',¹⁶ is not really substantiated.

In the next chapter an attempt is made to determine the export performance of local firms and TNC affiliates in terms of variables already considered for the profit margin analysis, and profit margin itself! Only SKILL 1, size, and profit margins are again the significant factors for foreign firms. The interpretations are rather forced as the following example would support: The capital employed/sales ratio is found to have negative sign and is significant at a 10 per cent level for FCEs, and not significant for local firms. Similarly SKILL 1, has a negative sign for TNC affiliates but is significant at a 10 per cent level only, and not at all significant for local firms. On this slender basis the author concludes that it confirms the hypothesis that Indian firms do not have a comparative advantage in either capital intensive industries or in skill intensive industries, and thus the 'technology factor' is not important for Indian firms! There is little one can learn about the TNC affiliates from this chapter. Earlier studies¹⁷ had found that the export propensity of transnationals was significantly lower than that of comparable Indian firms, particularly in manufactured products, and the chapter is hardly able to explain this fact.

The use of the 49-odd industries (at a near

three-digit level of disaggregation) for the explanation of the FDI intensity and discriminate analysis is acceptable, but for the profitability and export propensity it may have been better to use the data for firms individually setting up models for the two sets of firms, with the industry variables as the independent variables and a dummy characterising the ownership aspect. This would have rightly avoided the circularity that is there in the explanations of profitability and the export propensity. Another problem is that the same proxies have been used for different factors, as for instance in the case of skill intensity and employee compensation behaviour, which makes the interpretation tenuous.

One of the problems with this kind of empirical work is the very method of analysis once the sample or the home/host country is selected. The 'explanation' then is really one of the averages in terms of a set of factors sometimes quite tenuously represented by independent variables. What is precisely missed are the non-average firms, whose difference is seen more as a problem rather than as a poser or a lead to explore further, bringing in other factors and variables to arrive at a few archetypes of behaviour different organically (or in terms of the pattern) from each other; rather than in terms of individual or multiple associations. This comment about the methodology is particularly relevant here since the data often painstakingly gathered do typically end up supporting the principal hypotheses one starts with. The study under review is no exception despite the technical rigour and the more than usual care taken in the specification of the model and the variables.

The empirical work in the dominant paradigm has been carried out with the belief in its universal validity. Particular associations obtained between (proxy) variables representing certain factors and characteristics and other variables (which are sought to be explained), when they do not contradict, the paradigm are taken to support it. But when they do, are not necessarily seen as such but are rationalised on the basis of some home or host country peculiarities. The attempt to relate a particular association obtained say, in India to a similar one in Canada and another to a similar one say in Brazil, and so on, *rather than the totality of the associations* does violence to the idea of comparative studies. This study too is profuse with references to similar particular associations found elsewhere even when other associations are different.

We do know that firms from different home countries show differing propensities to set up production in host country markets even in the same product. Then there are differences between home countries (the firms) in terms of degree of vertical integration and the industry composition. It is not at all certain that the pronounced propensity of Germans to licence their technologies or of the reverse propensity of the Japanese to invest in the third world even in low technology

areas such as textiles and light engineering is explainable in terms of the difference in the industry composition alone. A possible analysis of the behavioral differences between different nationality groups of transnational affiliates could have been a valuable contribution.¹⁸

Leaving aside the 'eclectic' paradigm within which the study is situated, the facts, lend themselves perhaps to a different interpretation. The low or indifferent export propensity of TNCs in LDCs is by now well known despite the expectations that TNCs are well endowed (market linkages, global brand names, etc) to export from third world economies. The empirical work of Deepak Nayyar¹⁹ in answer to G K Hellenier²⁰ shows this clearly. Similarly studies²¹ which have sought to empirically understand export of manufactured goods from TNC affiliates in the LDCs, within the conceptualisation of the product-cycle thesis and its variants, have found that TNCs, despite working in old industries and with standardised technologies, have hardly ever used LDCs as a base for export to advanced countries. In other words the much talked about relocation of production under the aegis of the TNCs is more a hope than a reality. The export zone industries are the few exceptions, but even here their extent does not amount to a significant portion of the total manufacturing exports of LDCs.²² They are concentrated in a few countries with political considerations having primarily determined their particular locations. Manufactured exports from LDCs have been primarily brought about by local firms often times supplying for (foreign) firms and agencies located in advanced capitalist countries.

Similarly, the fact of high profit rates of TNC affiliates in the third world is hardly surprising. Furthermore, in the light of Vaitos²³ critique of the product cycle thesis: that it is 'essentially a theory of monopoly cycles'; and his further finding that TNCs demand a high rate of protection (and hence profits) to set up production in LDCs; and that their first choice is to export to LDCs, we must conceptualise manufacturing FDI in LDCs as having an essential anti-export bias. Indeed if it were not so, we should have seen large relocation of industry from the advanced capitalist countries to the third world with the TNCs playing a major role in the phenomenon, relocated industries being characterised by exports to advanced countries. And capital the world over should have widened rather than deepened. Even if we leave aside the more underdeveloped economies as unworthy of relocation given their poorly developed infrastructure, the large Latin American countries, India and much of South-east Asia are quite all right for hosting relocated industries on a large scale, if costs alone²⁴ were to determine the flow of capital and enterprise. Remember also that hardly any country discourages FDI, which seeks to use that country as a base for export of manufactures to the rich countries. Mainstream theory has side step-

risk: When LDCs are seen by TNCs as hosts to earn very high returns (often the true pay-back period for the actual inflows is less than 18 months) and not as places to hold large stocks of capital, then the answer implicit is that the perceived risk is too high. This is a statement that is not subject to the falsifiability criteria since the idea of risk is hardly independently conceived and so amounts to a tautology.

The particular reasons why TNC affiliates are able to maintain higher profit levels throughout the post-independence period is a question that has yet to be answered. The author's conclusion that the TNCs and the local firms belong to different strategic groups is certainly a step in the right direction, but the analysis is unable to show specific ways in which they are different. Once this question is answered satisfactorily then we may see many of the other associations (such as use of highly paid labour, better debt equity ratio, better liquidity, higher value added by sales ratio) as arising more out of high profit margins along with a low propensity to invest.

The additional contribution of this book in helping to understand the phenomenon of transnational affiliates in India is quite minimal. This is so because the methodology and the chosen paradigm within which the study is cast, have been elevated above the problem at hand. Moreover there is at best only a formal attempt to relate the phenomenon to the economic and policy environment in India.

- 11 There are exceptions as for instance when a TNC affiliate carries out specific parts of a research task, the more labour intensive mundane, and those that can be partitioned off from the rest of the activities that constitute R and D without affecting their integration mainly to take advantage of lower costs. A good example of this would be the R and D activities of Ciba Geigy in India before their suspension. The increasing R and D activities of British affiliates of American transnationals is of a somewhat different kind, yet its links with the local host economy or even the local affiliate principal activities are marginal. In any case this kind of R and D by advanced country transnationals is almost entirely absent in the Third World.

THE POLITICAL ECONOMY OF UNORGANISED INDUSTRY A Study of the Labour Process

MANJIT SINGH

The term 'unorganised sector' is widely used in current discussions of the Indian industrial scenario. However, it still suffers from a great deal of conceptual confusion. The purpose of this study is to clear part of this conceptual confusion by studying the labour process in the unorganised industrial sector through a detailed case study which is divided into two parts.

In the first part, the author traces the growth of industrial capital and the path of relations of production in Europe and India. Dr Manjit Singh demonstrates that the course followed by industrial capital in India was different from Europe, primarily because of India's colonial experience.

The second part of the book presents an analysis of the woollen hosiery industry of Ludhiana. Dr Manjit Singh finds that, despite the availability of advanced technology, this small scale sector still relies on hand-operated machines. As a result, this sector is based on the putting-out system of production which means that the workforce is scattered and the workers never know their real employer. This has affected the emergence of working class consciousness and the development of a strong trade union movement.

This book will appeal to sociologists, economists, industrialists and trade unionists.

Colonial Power and Micro-Social Interactions

Nineteenth Century India

Sabyasachi Bhattacharya

Theorising and historical narrativising have concentrated on the apparatuses and activities of the colonial Indian government and on the 'state derivation' question in terms of the mode of production and the world capitalist system. This paper contends that analysis of the architecture of colonial power will remain incomplete unless it is sensitised to the process of its constitution at the micro-social level, in everyday life and the mundane actions of ordinary people, below the over-arching framework of the colonial state. An associated question that arises relates to how an agenda of micro-social investigation articulates with the study of the macro-structure.

THE study of colonial power has been focused on the macro-structure.¹ Theorising as well as historical narrativisation—often delinked from each other, to the detriment of both—have concentrated almost exclusively, in the empirical mode, on the apparatuses and activities of the colonial Indian government, and at a rarefied theoretical level on the 'state derivation' question in terms of the mode of production and the world capitalist system. Useful as these studies are, insofar as the theoretical formulations offer us some testable propositions,² there remains a doubt about the sufficiency of that enterprise. It is my argument in this paper that analysis of the architecture of colonial power will remain incomplete unless it is sensitised to the process of its constitution at the micro-social level, in quotidian life and the most mundane actions of ordinary people, below the overarching framework we call the colonial state. How such an agenda of micro-social investigation articulates with the study, both empirical and theoretical, of the macro-structure is also a question that we must address, however tentatively.

It is necessary to put my argument in a larger context in terms of some simple propositions, though it will not be possible to elaborate on them in this paper. How was colonial authority made perceptible to the subject race, once coercion had achieved subjection? Perhaps two processes, interactively drawing strength from each other, were at work: on the one hand what I propose to call the *delegitimation* of pre-colonial authority in political life, and, the obverse of the process, the *appropriation* of the insignia of authority by the colonial state from the pre-existing indigenous inventory. The delegitimation process was instantiated in innumerable displacements of individuals and institutions empowered by pre-colonial history. The most significant instance was the trial of the Mughal emperor Bahadur Shah II at his own palace in Delhi in 1858. The significant thing about the trial was not only the symbolism and visibility of a trial, by junior English army officers, of the 11th successor to the throne after Aurangzeb, but

also that the chief charge against Bahadur Shah was that of treason: "he being a subject to the British government in India, and not regarding the duty of allegiance did... proclaim and declare himself the reigning king of sovereign of India..."³ Such acts of delegitimation were accompanied by parallel displacements in authority structure at lower levels *vis-a-vis* the 'country powers' (i.e., the princely states), the chiefs, zamindars, etc. The obverse of this process is exemplified by the Delhi Durbar of 1877 to proclaim Victoria the empress of India—an inspired act of the symbolic-cultural construction of new colonial authority which Bernard S Cohn has so insightfully studied in his essay on the significance of the Durbar in 'representing authority in Victorian India'.⁴

A doubt: how much of the delegitimation process at the top (e.g., the constitutional niceties of the sovereignty issue in the Mughal emperor's trial) and the rituals of empire (at Delhi in 1877 or re-enactments at the viceroy's levee, etc., from time to time) was accessible to the vast majority of the subject race? To the latter, was the colonial state any more than the totalisation of their life experience insofar as their life was touched by the remote extremities of the limbs of the state—the 'daroga' and his minions, the 'sheristadar' and the like in the collector's cutchery, the small causes court, and so forth? How was the supremacy of colonial authority brought home to ordinary people in their daily life? Given the macro-structure of colonial power, how are its messages translated into micro-social practices in daily life? How is an abstract notion of authority transmitted to the recipient people in concrete mundane interactions with the possessors of authority? Are certain stereotyped social gestures adapted or created by the coloniser to signal superordinate-subordinate relationships in everyday interactions with the colonised people? What are the means used to 'stage' interactions between Englishmen and natives in a manner appropriate to the representation of the superordinate position of the English? These are questions which may help us explore the history of the constitution of colonial power

in quotidian practices below the overhanging framework defined in terms of theoretical constructs and symbolised in terms of a spectacular event like the Delhi Durbar from time to time.

RITUALS OF COLONIAL POWER IN EVERYDAY LIFE

"There can be no society that does not feel the need at regular intervals to maintain and strengthen the collective sentiments and collective ideas which constitute its unity and personality... Hence there arise ceremonies that in their purpose, in the results that they produce and the procedure employed in them, are no different from religious ceremonies proper. What essential difference is there between an assembly of Christians celebrating the principal dates in the life of Christ, or Jews celebrating the exodus from Egypt or the handing down of the ten commandments, and a meeting of citizens commemorating the institution of a new charter of morality or some great event of national life?"⁵ Thus Emile Durkheim.

This seminal idea of political rituals as a vehicle for the representation of the "collective sentiments" of a society, and thus the construction of a political culture, has been a fruitful line of historical investigation. In particular such investigations readily come to mind in the area of the study of medieval European kingship⁶ and more recently, the study of the rituals and other symbolic-cultural means of legitimation in medieval India.⁷ The Durkheimian perspective on ritual was significantly extended by Erving Goffman in microsociological studies.⁸ Distinct from the tradition of symbolic interactionists and 'role theorists' and pre-dating recent ethno-methodologists' work, Goffman framed an agenda of research that seems to have one central theme which is of interest to us—how ritual permeates daily life and commonest interactions. There is probably in Goffman's work an affinity with Durkheim, as Collins suggests. Whether or not that is true—for Goffman has been reticent on the question of locating his approach in relation to recognised 'schools of thought'—his approach addresses the kind

blem. However, one may only get certain insights from Goffman's and related investigations of the micro-social genre. Apart from the obvious difference between the sort of data they deploy in analysis and the quality and texture of historical evidence, there are differences between the colonial context and that to which Goffman applied his mind. The specificities of the 'colonial situation' are, of course, widely ramified,⁹ but we have in mind only three immediately relevant features.

First, and most obviously, the social situations to which originally micro social analysis was applied (e.g. contemporary Western middle-class Goffmanland) offer a contrast to the colonial ones (e.g. 19th century Anglo-Indiand), because in the latter a schism between the ruling race and the ruled structured social interactions between members of these two categories. This applies in various degrees even to routine everyday social encounters in the colonial context. Secondly, representation of authority is more readily legible in societies where the superordinate and the subordinate share the same set of signifiers in a culture. Contrariwise, in a colonial society, in the absence of common signifiers of authority, messages across an ethnic and cultural divide are not received, or at least not with their full import. Anxiety about this (of the 'what do the natives think' variety) is a constant refrain of British Indian bureaucratic discourse in the 19th century. Thirdly it follows that the British would have to appropriate bits and pieces out of the pre-colonial Indic cultural and social practice to refashion signifiers of authority to suit their own ends. As I have said earlier, this process accompanies the process of delegitimation of pre-colonial authority. In the colonial context there coexist two (at least two, there may be more) sets of signifiers and there develops a subset which is the locale of a process of development of elements common between those two sets. One can visualise it as two circles which overlap and between the two points where they intersect is the subset common between the two circles or sets. At this hermeneutic intersection as I propose to call it, there develops a stock of signifiers interpreted in a manner common to both the English rulers and the natives ruled. In the beginning of English Indian encounter this stock was small and signs were misread (e.g. what was prestatory gift as a deference indicator to a 17th century Mughal noble, meant to the British a bribe for favours). As colonialism settled in to its grooves signs were interpreted better. As the foreign power prevailed over the indigene, one meaning tended to countervail another (e.g. the honorific meaning of medallions bearing Victoria's portrait in late 19th century prevail over prejudices against the idolatrous meanings perceived by Muslim ruling princes).¹⁰ The most effective cultural interventions by colonial power would be at the hermeneutic intersection

into old symbols, institutions and even routinised actions (e.g. taking off one's shoes to show deference).

Thus, while the micro-social theoretical literature (specially Goffman's empirical work) is of use in generating and framing questions, in setting up an approach to the process of construction of colonial authority, one has to depart from the received theoretical approach.¹¹ We have to build upon the specificities of the colonial situation and when we so ground ourselves (as will be hopefully evident from the empirical portion of this paper—which is meant to be indicative of the quality of evidence available, and not a comprehensive inventory) the need for a reorientation of theory with regard to the specificities of colonial societies becomes clear.

The questions that we have raised earlier about the constitution of colonial power in everyday social interactions are not easy to answer. Any one who has handled sources relating to British India of, say the 19th century, will realise that I propose to make a beginning by examining a simple act that of taking off one's shoes.

There is an apparently trivial incident described in great detail, in the memoirs of field marshal Lord Roberts of Kandahar *Forty one years in India: From Subaltern to Commander in Chief*. During the uprising of 1857, he says, the British were so pleased with the support given to them by the Kapurthala army, among others, that in order to pay a compliment to the officers and the principal men with the Kapurthala troops, Edward John Lake (1823-77) the commissioner of Jalandhar in 1857 invited them to his house to meet them. The officer who organised the affair was John Nicholson (1821-57), an officer famous in Punjab as a soldier (Nikkul Sevi Sahib) and a fierce administrator—he died at the storming of Delhi soon after this incident. Roberts was then a young subaltern under Nicholson and the point of his narrative is to extol the merits of that famous empire builder. The event witnessed by Roberts at the close of Lake's meeting with the Kapurthala officers was as follows:¹

At the close of the ceremony Mehtab Singh a general officer in the Kapurthala Army took his leave, and, as the senior in rank at the durbar, was walking out of the room first when I observed Nicholson stalk to the door put himself in front of Mehtab Singh and waving him back with an authoritative air prevent him from leaving the room. The rest of the company then passed out and when they had gone, Nicholson said to Lake: "Do you see that General Mehtab Singh has his shoes on?"

Lest the English reader back home should miss the significance of these momentous words, Roberts adds here a footnote: "No native, in native dress, keeps his shoes on when he enters a room, unless he intends disrespect."

Lake replied that he had noticed the fact, but

ing in Hindustani, said: "There is no possible excuse for such an act of gross impertinence, Mehtab Singh knows perfectly well that he would not venture to step on his own father's carpet save barefooted, and he has only committed this breach of etiquette today because he thinks we are not in a position to resent the insult, and that he can treat us as he would not have dared to do a month ago."

Eventually Mehtab Singh was compelled to take off his shoes and carry them out of the room in his own hands. One may note that Nicholson spoke to Lake in Hindustani to convey to the third person, Mehtab Singh, the Indian rules of etiquette. Two points need attention. First, the breach of etiquette is a political act. Second, the etiquette in question is explicitly derived from 'native' rules of proper behaviour.

The event was staged and the dramaturgical dimension of the interaction between the actors, British and Indian, was of crucial importance. The stage craft begins with 'framing' the interaction as a levee demanding certain stereotyped gestures and rituals of everyday life, it culminates in staging an act of repentance by the native who failed to make the ritual signal of subservience or at least, respect. The presentation of Nicholson's self is, of course, dictated by a collective British conception (about themselves in relation to the natives) and may or may not have been a manifestation of his individual personality. Lake did not react initially the way Nicholson did, but he was brought in line soon enough and behaved as the collective British self conception in this context demanded.

It is well known that Goffman owed to Durkheim the idea that individuals possess an inventory of shared orientations of a 'collective' kind. The twist in the colonial context is the appropriation by the colonisers of some of the orientations, often objectified in pattern of behaviour or even artefacts, belonging to the subordinated people and in the process imparting a different meaning to things pre-dating the colonial regime. This is what makes the establishment of rituals of quotidian interaction of a complicated affair. I have used some of Goffman's analytical insights into everyday social encounters to understand an episode minutely observed in detail by a knowledgeable participant to show how a stereotyped action (taken from the 'native' stock of such actions) was being re-created in the colonial context to sustain in day-to-day, face-to-face interactions the superiority of one set of actors, British, over another set of actors, native. Taking off one's shoes as a mark of deference is one of the many items in the inventory of social rituals accumulating under British auspices.

A question often raised in the theoretical debates on micro sociological approach is about the weightage to be given to fragments of interaction or discursive practices. In other words, the methodological question is, how much do such fragments tell us about

the macro-structures, entities such as the state or class or caste and so on and in this instance, power? Evidently the weightage to be given to evidence like the one reported by Roberts on an incident in 1857 at Jalandhar would depend on the extent to which one can establish the observed piece of micro-social interaction as a part of *recurring pattern*. Otherwise, as Cicourel¹³ has put it, it is difficult to establish how 'a few fragments of a conversation or even several pages of discourse can presume to stand for the complex social structures identified in macro-theory, such as large-scale political, economic, demographic and stratificational patterns'. In short, *regularities* in discourse and practice need to be established to enable us to read the meaning of micro-social evidence.

AN EMERGING PATTERN

In the early 1830s an old Indian hand, F J Shore, wrote of the Indian custom of taking off one's shoes, without getting unduly exercised about it. In his essay on 'The Behaviour of the English towards the Natives' he writes 'on the point of taking off one's shoes, it may be observed that this, like any other mode of testifying respect, means nothing in itself beyond the idea that is attached to it—it is no more than taking off our hats'.¹⁴ Likewise we find Sir Richard Temple taking off his shoes without any fuss about any damage to his dignity in the palace of Nizam of Hyderabad. "On arriving at the threshold of the Nizam's room of audience I took off my boots (which was easily done in a moment) and walked forward". This was the right etiquette. It was taken for granted in the late 18th and even in the early years of the 19th century that this would be done. C. F. Harvey of the Indian Civil Service who served in Burma for decades pointed out that 'English officers were accustomed to kneel unshod in the presence of Indian kings'.¹⁵ (The problem with the Burmese was that they not only demanded that shoes be taken off before entering the palace but also required the English envoys to the court of Ava to 'prostrate themselves at gateways and spires' and their virtual incarceration in 'a scavengers' island'.) Similarly Europeans who did not want to unshoe themselves Bishop Heber had recommended with his usual ecclesiastical tact, should not enter temples and mosques.

But this customary gesture of respect by taking off one's shoes was increasingly unacceptably to the majority of Englishmen, particularly in the latter half of the 19th century. It was, of course, well known, even to civilian and army officers, with or without a smattering of an Indian language, that taking off one's shoes was a token of respect in the Indic culture. It particularly applied to meetings with high dignitaries. Emperor Bahadur Shah II had gone to the length of including this as evidence in his defence statement at his trial in the Red Fort in

1858.¹⁶ "As regards the rebellious army it may be stated that they never saluted me even, nor showed any mark of respect. They used to walk into the Hall of Special Audience (i.e., the Diwan-i-Khas) and the Hall of Devotion with their shoes on". If they came into the imperial presence with their shoes on, how could Bahadur Shah be accused of exercising sovereignty over or accepting the allegiance of these soldiers? Thus the arguments of the prosecution attributing to Bahadur Shah the leadership of the rebellious soldiers, according to the accused, could not be sustained. That was the defence put up by Bahadur Shah. This is one of numerous examples of the significance attached to the removal of shoes as a mark of respect.

The recognition of the value attached in Indian culture, both Hindu and Muslim, to the simple act of taking off one's shoes had two consequences on the behaviour of the Englishmen serving in India. First, natives were required to show respect to Englishmen in authority by taking off their shoes. Second, for Englishmen to take off their shoes in deference to an Indian was derogatory to the prestige of the ruling race and, therefore, to be avoided. As for the first, we have already seen the 1857 episode at Jalandhar recounted by Lord Roberts—a kind of richly detailed description of how such things happened which is much more effective than statements of a general kind.

To illustrate the other principle, not to jeopardise British dignity by taking off shoes in deference to a native, we may look at a minor event in Hyderabad in 1869. C. B. Saunders was recently appointed the resident at Hyderabad. For the past several decades the British residents had followed the custom of taking off their shoes before coming in to the Nizam's presence—an old etiquette of the court. Saunders declined to do so. An opportunity to make his point presented itself: the old Nizam Afzal ud-Daula died in early 1869 and his successor was a minor. Saunders thought that the application of the custom of taking off one's shoes was derogatory to him and to other Englishmen who might visit the Nizam with him on the occasion of the new Nizam's installation or for that matter on other occasions like calling upon the Nizam to express condolence on his father's death. 'The minister and the Amir-i-Kabir (the chief noble family of Hyderabad and hereditary head of the royal household forces) did not quite relish the idea and gave way somewhat reluctantly'.¹⁷ At the time of the resident's visit of condolence to the Nizam the Indians divested themselves of their shoes, while the British party sat on chairs of European manufacture with their boots on. After a few days, at the more formal durbār installing the new Nizam, the same procedure was followed. Thus, 'a practice which was not considered consistent with the British position in India and with the dignity due to a paramount power, was quietly dropped'.¹⁸ The English

resident had acted with 'most commendable promptitude'.¹⁹

It was a famous victory. The Nizam accepted the departure from an old custom. His age was two years and eight months. The local nobles' demurrals were brushed aside. The event may appear trivial in this day and age but great importance was attached to it by the British policy makers. The viceroy wrote personally to the secretary of state in England about it. Resident Saunders had behaved 'with great firmness' to save Britons from 'a humiliating ceremony', wrote Lord Mayo to Lord Argyll.²⁰

In the 1830s a civil servant in Bengal presidency noted that the custom of showing respect by taking off one's shoes was dying in Calcutta. But then, the Bengalees were 'lowest in habits and principles of all the people of India, and of the Bengalees, the inhabitants of Calcutta are, perhaps, the worst'.²¹ What began to happen was that natives who were habitually in western dress in public began to give up this custom and they were tacitly allowed to do so by the English. Shore did not approve of it and noted that this contagion was spreading so that 'natives of rank' were beginning to 'walk into our rooms with their shoes on their feet'.²² He surmises that 'among themselves they will boast of having been permitted to do so, and speak contemptuously of the English for allowing it'—though 'they sometimes affect to tell us, that it is a matter of little consequence'.²³

The latter point, the Englishmen thinking about 'what the natives think' is an important element in the process of micro-level interaction—as important as it is in imperial policy making at the higher levels. This is not only because of a natural concern of the rulers as to how the ruled are reacting to their actions. It is also because a complicity of the 'native' mind is needed to constitute colonial power, insofar as it is a cultural project.

THE MACRO LEVEL ORDER

We have isolated for analysis only one of a large inventory of stereotyped actions, in face to face interactions, denoting deference in Indic culture and appropriated and suitably valorised by the British rulers in India. What have been called 'deference entitlements'²⁴ were varied in Indic society and included (as in many other societies elsewhere) entitlement on the basis of birth in a certain caste or kinship ties with, say, a princely family or dominant lineages in a region. Thus, the claim of the British to deference on the basis of birth in a particular racial stock was not altogether foreign to a tradition in this country where deference-entitlement could be acquired by birth.²⁵ However, Indian compliance to this privilege could not be secured on that basis alone. Its real basis was an Englishman's proximity, real or imagined, to those who wielded power derived from the colonial state. The presentation of this kind of deference entitle-

ment demanded that the English present a common front *vis-à-vis* the indigenous population. As the maharaja of Scindia, speaking of the English as a race, put it in 1867 'you are not popular', but 'your prestige fills men's minds', in part, because of 'the unity of feeling and loyalty to one another which exists amongst you'.²⁶ A possible threat to this network binding together Englishmen, often physically isolated in the district or a princely state residency, was miscegenation. If the ethnic boundary becomes indistinct the deference due to the ruling race would diminish. Hence the great concern for preservation of that boundary which Kenneth Ballhatchet has documented.²⁷ As the British raj prospered and consolidated itself as a territorial power, the Eurasian became an embarrassment and in 1791 the court of directors resolved to exclude them from superior civil, military and marine services, i.e. from coveted service and army commissions. The rationale for this was that 'to admit persons of half blood to higher situations' would detract from the prestige of the official elite, 'for the native gentry of the country would look upon them with no respect'.²⁸ By the end of the 19th century the prejudice against miscegenation was so strong in high decision making circles of British India that many at that level argued that if European bachelor officers must seek the company of native women (e.g. in Burma where there were few European women about) let their liaison be secret and illegitimate. The secretary of state Lord George Hamilton was of opinion that 'a legal marriage (with native women) would put the Europeans into a lower position in the estimation of the native, than if he kept the woman as his concubine'.²⁹ Viceroy Curzon was equally strong in his view that inter-racial marriage must be discountenanced as strongly as possible. That was in 1901, at the height of 'Victorian puritanism'.

We have concentrated attention on one type of deference indicator, unshocking oneself, as a representative instance. Such examples can be multiplied to show how similar rituals pervaded various interactive contexts. Hon'ble F. J. Shore, a civil servant in the NW Province and Central Provinces wrote a great deal in the 1830s on how British rule in India might be 'facilitated by adopting a mode of behaviour which will influence the natives to regard us with respect and favour'.³⁰

The main point made by Shore was that 'The acts of government, even if they are unjust, often affect comparatively few but the behaviour of individuals is felt by all in their daily and hourly intercourse with us. And 'It ought to be the object not only of every government servant but of every Englishman in India, to strengthen stability of our rule, for dreadful indeed would be the state of the country were the British authority suddenly to be withdrawn'.³¹ It was the political import of everyday interactions between the British and the Indians which Shore sought to emphasise.

Between these truly micro-social processes of everyday life we have been talking about, and the rituals and pageant of, say, the imperial durbar in 1877 at the symbolic centre of the Indian political order, there were a whole series of intermediate range symbolic representations and rituals of imperial power. For example, the rituals of the British courts of law, it seems, deeply impressed the large numbers who attended the court. Along with many spaces for enacting power relations in Indian British transactions—the collector's *cutchery*, the district police chief's office, the parade ground of the local commandant in the army cantonment—the court of law was a stage and it had more than usually impressive rites.³²

BETWEEN MICRO AND MACRO

Beyond the intermediate range of British Indian transactional spaces like the court of law, the collector's *cutchery*, etc., was the apex arena at the centre of the political system. The thrust of our argument has been that an exclusive concentration on the latter provides a very inadequate picture of the process of the constitution of colonial authority. Historiographic tradition is heavily weighted in favour of that apex centred approach. And to the extent there has been any theoretical thinking about the colonial state and its formation it has been locked into a cross wire focused on the central processes in building the colonial political order. Scenarios with the colonial state as the actor are all too familiar and while the inherent reductionism has gone unquestioned, contestation has centred around the attributes of the entity called colonial state. As distinct from this approach the 'micro translation' of the macro order conceptualisation and explanation may be useful.³³

That is not to say that micro social political phenomena alone constitutes the reality. The position of some theorists of micro sociology [e.g. Randall Collins and Jon Harre] push the argument to an untenable point in virtually refusing to recognise macro phenomena as real except as an aggregation of micro phenomena.³⁴ This is a position close to methodological individualism in a way and takes us back to an old agency structure debate. One recalls Max Weber on the need to 'exorcise the spectre of collective conceptions so that social study can proceed from the actions of one or more separate individuals'.³⁵ Likewise F. A. Hayek on individual actions as the route towards understanding social phenomena.

Here a caveat is in order. Does a research strategy centred upon social interactions, ultimately of individuals in the colonial context as a means of studying the construction of colonial authority assume the premises of methodological individualism? Not necessarily. Admittedly our approach concedes centrality at this level of analysis, to the individual as the agent. But can we push the point farther and say that their dispositions and actions alone constitute small- and

large-scale social-political phenomena, that structural explanations are to be dismissed as imperfect compared to the explanations at the level of individual action? Some questions expose the untenability of such a position. Are the actions of individuals a product of their beliefs or, to use Bourdieu's phrase, 'dispositions'?³⁶ Where do these beliefs and dispositions come from? Do they not come from collectivities of various orders? Does not explanation of macro-social phenomena exclusively in terms of individual actions and dispositions only relocate the explicandum from one level to another?

If then we reject, with Steven Lukes among others, methodological individualism as 'truistic' at one level and untrue to social reality at another, where does it lead us?³⁷ It leads to a middle ground. The articulation between the micro-level and macro-level, different aspects of reality, needs to be recognised. It has been pointed out that Braudel's massive enterprise of capturing the evolution of capitalism in 16th-18th century Europe at the everyday material existence level is an exemplar in this respect.³⁸ He identifies several economies in parallel evolution, for example, below the highly visible level of the market transactions which economic historians have been chiefly concerned with, there was a distinctly different province of practice in the routine, infra-economy of the rural grassroots level. And yet these levels draw strength from each other, the formal and informal sectors interact with each other to build an overall capitalistic structure. More directly addressing the problem of so called micro macro and agency-structure differentiation, Giddens provides a very useful construct, 'structuration'. Structure is "the medium and outcome of the conduct it recursively organises, the structural properties of social systems do not exist outside of action but are chronically implicated in its production and reproductions". Thus structure is continually in the process of being formed and itself forming action in a dialectical relationship. "The 'dialogue between structure and conjuncture' which Braudel wants to capture is parallel", Giddens writes, "to that which I seek to represent in a more detailed way in structuration theory".³⁹ Such an approach may help us conceptualise the connection we have posited between everyday micro social interactions and the colonial state.

Notes

1 This paper forms a part of a forthcoming work on the 'Colonial State: Theory and History'. I would like to thank the members of the History Faculty at Calcutta University for their comments on the theme of this paper (March 1991).

* Includes Rs 15 314 89 for which the RBI approval is being sought

NOTES FORMING PART OF THE ACCOUNTS FOR THE YEAR ENDED 31ST MARCH, 1991

PRINCIPAL ACCOUNTING POLICIES

General

These accounts have been prepared according to the historical cost convention and in accordance with statutory requirements prescribed under the Banking Regulation Act 1949 and practices prevailing in the country

Currency Translation

- Assets and liabilities in foreign currencies are translated at the rates notified by FEMA as at 31st March 1991 and Contingent liabilities in respect of outstanding forward exchange contracts are included at the contracted rates
- Outstanding forward exchange contracts are revalued at the rates notified by FEMA as at 31st March 1991 and resulting losses on revaluation are charged to income

Investments

Investments are valued at cost or market value whichever is lower

Advances

- Provision for doubtful advances: The Management reviews the advances/loan portfolio each year in addition to periodic reviews and based on their judgement sets aside specific provision for doubtful advances. The provision for doubtful advances is made to the satisfaction of the auditor after considering present value of realisable security held by the Bank in respect of such advances and other related factors
- Advances are stated net of bills of exchange rediscounted and specific provision in respect of doubtful debts. The general loan loss provision has been included under 'Current Accounts and Contingency Accounts' etc.

Premises, Furniture and Fixtures etc.

Premises, furniture and fixtures including vehicles and equipment have been valued at cost less depreciation. Depreciation has been provided on straight line method at the rates specified by Head Office

I) Income Recognition

- Interest income is recognised on accrual basis and in the case of non performing advances the same is recognised on recovery and settlement
- Commission and fees are treated on accrual basis except front ended commission on letters of credit which is fully accounted as income on receipt

G) Staff Benefits

Liabilities in respect of retiral benefits to employees are provided for by payments to duly recognised Gratuity Fund, Pension Fund and Provident Fund. The amounts of payment to the funds except for Provident Fund are determined on the basis of actuarial valuation

H) Net Profit

- The net profit disclosed in the profit and loss account is after
- (i) Provision for taxes on income in accordance with statutory requirements
- (ii) Provision for doubtful advances
- (iii) Adjustments so as to value investments at lower of cost and market value,
- (iv) Other usual and necessary provisions

2 HEAD OFFICE RESERVE ACCOUNT

Head Office Reserve Account comprises of

- Capital amount of Rs 2 000 000 00 brought in from Head Office in compliance of Section 11(2)(a) of the Banking Regulation Act 1949 and
- The funds remitted by Head Office in DM equivalent of Rs 86 322 178 41 together with a portion of approved irremittable surplus for the year 1987 amounting to Rs 2 153 459 00 retained by the Bank to meet the cost of acquisition of residential and bank premises at Bombay and to meet the deposit advance rent of bank premises at Delhi as per the Reserve Bank of India's guidelines

4 The previous year's figures have been regrouped/rearranged wherever necessary

See our report attached to the Balance Sheet

Auditors' Report on the Accounts of the Indian Branches of Deutsche Bank, A.G., Under Section 30 of the Banking Regulation Act, 1949

We have audited the attached Balance Sheet of the Indian branches of Deutsche Bank A.G. (Incorporated in the Federal Republic of Germany with limited liability) as at 31st March 1991 and the Profit and Loss Account of the Indian branches of the Bank for the year ended 31st March 1991 annexed thereto.

The Balance Sheet and Profit and Loss Account have been drawn up in accordance with the provisions of section 29 of the Banking Regulation Act 1949 read with provisions of section 211 of the Companies Act 1956.

We report that:

- (1) we have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of the audit and have found them to be satisfactory;
- (2) the transactions which have come to our notice have been in our opinion within the powers of the Indian branches of the Bank.

Bombay 30th May, 1991

- (3) in our opinion proper books of account as required by law have been kept by the Indian branches of the Bank so far as appears from our examination of these books;
- (4) the Balance Sheet and Profit and Loss Account dealt with by this report are in agreement with the books of account;
- (5) in our opinion and to the best of our information and according to the explanations given to us the accounts together with the notes thereon give the information required by the Companies Act 1956 in the manner so required for banking companies and on such basis the Balance Sheet gives a true and fair view of the state of affairs of the Indian branches of the Bank as on 31st March 1991 and the Profit and Loss Account gives a true and fair view of the profit of the Indian branches of the Bank for the year ended on that date.

The Ethnographer and the People

Reflections on Field Work

Vinay Kumar Srivastava

Once it is agreed that a society should be studied as a whole for contextualising a specific problem, field work for the ethnographer becomes an experience of undergoing nativisation in a different culture, with a different set of people. In such situations an episodic narration of encounters with respondents and the actions they carry out 'naturally' is a matter of anthropological reflexivity which an ethnographer should undertake in order to identify the impediments in the process of doing field work, to describe the strategies adopted for establishing relations with the people and, above all, to outline the process in which the self is comprehended in the background of the other. This paper is such a narrative reflection on field work in Baiga Chak in the Satpura region of Madhya Pradesh

[This paper is published in two parts. The second part will appear next week. References are appended to part two.]

CLIFFORD GEERTZ [1988: 82] makes a distinction between 'anthropologist as pilgrim and as cartographer'. As pilgrim, he journeys through, invariably for more than a year, the nuances and matrices of a culture, usually different from his own. Imbibition of the 'other culture' is an experience—a conscious experience of being enculturated—and a key to comprehend an emic view of the people. As cartographer, the anthropologist's task is to 'collect data', which, after being sifted and analysed, yield the picture of a society the way it is organised and endures over time.

The distinction between these two roles—of pilgrim and cartographer—is heuristic, because the ethnographer, both in the field setting and outside, oscillates between them [Geertz, 1988: 82]. Experiences of pilgrimage in the 'other culture' are recapitulated to effectively support a case [Carrithers, 1988: 20], and they have implications for the cartographic work, of data-collection, and for an adequate explanation of the facts.

Though data-collection seems to be a mechanical work of skill—identifying the variables of study, formulating an interview guide and observation schedule, preparing a questionnaire and administering it, if the situation demands, as a schedule, collecting case studies, preferably of extended variety, each of its steps is conditioned by the paradigmatic axis occupied by the ethnographer. Is the culture under study treated as a soulless entity? Are the people 'subjects of study', very much like the subject matter of other positive sciences? Does the ethnographer take a humanistic stance in approaching the people, involving them fully in the enterprise of learning? Does he take up the role of an interventionist, educating the people, distributing the efficacious modern medicines, helping them in their dealings with bureaucracy, or taking up their cause with the local government?

All these questions pertaining to the intellectual stance the ethnographer takes in the field, and the paradigmatic position he adheres to, are of alarming significance in intensive field works; they may not be of such significance in survey researches. Intensive field work, notwithstanding the specific problem it aims to investigate, is all-

encompassing in the sense that each piece of information is gathered by the ethnographer, although it may not deserve a respectable place in a problem-oriented ethnographic writing.

Once it is agreed that a society (or a community, as the case may be) should be studied as a whole—where holistic ethnography occupies a frontal place—for contextualising (or locating) a specific problem, the responsibility of the ethnographer increases. Since there is no substitute to observation, he is required to stay for a considerable time with the people. More than data-collection, field work becomes an experience of undergoing nativisation in a different culture, with a different set of people.¹ Personal accounts of such experiences are recorded in the ethnographer's diary, which may be called for substantiating a case or observation. At a higher level, the ethnographer comprehends his self by wayfaring the 'other culture'—we come to understand our culture ('us') much better by detouring that of the others ('them').²

Each field work is an array of encounters with respondents, and the actions they carry out 'naturally'. These encounters are not simple interview and observation sessions, as they are described in standard texts on research methodology; often, they place the ethnographer in embarrassing and delicate situations, often, they impose a structure of demands on him, and often the roles are reversed. The people may desire the ethnographer to tell them how marriages are arranged in his society, or how conflicts are arbitrated. The ethnographer, in such situations, is expected to approximate the role of 'good' informant to his 'people'.

An episodic narration of these encounters is a matter of anthropological reflexivity which an ethnographer should undertake to identify the impediments in the process of doing field work, to describe the strategies adopted for establishing relations (often life-long) with the people, and above all, to outline the process in which the self is comprehended in the background of the other. A field diary is no substitute to the accounts of reflexivity, and so is the meshing up (or, messing up) of the diary—a highly privatised account of one's likes and dislikes not

documented with the intention of publication⁴—with the field notes—the primary material on the basis of which relations between social and cultural facts are drawn.

In line with anthropological reflexivity, this paper is a reflection of a field work, consisting of a sequence of encounters with the key respondents and the 'officials' of the field area. The anthropological implications of each encounter have been briefly discussed. No pseudonyms have been used in the text.

II

In November 1987, I accompanied the MSc final anthropology class for a field work, carried out as part of the curriculum, to Baiga Chak, a reserved forest area of the Satpura range, in Mandala district of Madhya Pradesh.⁵ Baiga Chak is famous in the history of Indian anthropology. It was for the people of this region that Verrier Elwin [1939: 511-21] proposed his—what some would call notorious—thesis of physically isolating the tribal communities so that their interests could be safeguarded against the exploitative and nefarious interests of the landlords, missionaries, and other itinerants.

The suggestion for selecting this area, and its predominant inhabitants called the Baigas, came from an official of the Tribal Development and Training Institute, Bhopal. Notwithstanding the promising growth of urban and industrial anthropology and a strong movement to study one's own cultural milieu [Jackson (ed), 1987], anthropological work seems to be at home in the study of 'other cultures', in the romanticised exoticism of cultural practices surviving in some remote corner of the world [Levi-Strauss, 1984: 12-13; Stocking, Jr, 1983]. The Baigas, a primitive tribe of Madhya Pradesh, were presented to us as conforming to the anthropological ideal: we were told that since the Baigas enjoyed the reputation of 'medicine-men', 'witch doctors' and healers, one would witness 'inspirational' and 'non-inspirational' divination in them, the fast disappearing lore, and before their funeral odes are sung, they must be textualised with the minutiae of details.

Our desire to know something about the people before the 'Voyage of Beagle', remained frustrated as nothing substantial existed in print on these people, besides the oft-quoted Elwin's [1939] book. But in a span of 48 years, qualitative changes must have occurred in the life-style of these people, we argued, because of development programmes promoted and executed by the agencies especially founded to look after the interests and welfare of primitive tribes.⁶ Could a study of change, by comparing the contemporary situation of the Baigas with that of Elwin's work, with emphasis on products of change, if not processes, by resorting to dual synchronism, be an underlying theme of the study? We agreed on this, thus endeavoured to study the Baigas from 1932 to 1939.⁷ The concerned official, on whose advice we were visiting this anthropological laboratory, had promised to make all arrangements for us to stay right in the heart of the forest.

III

The relation between the self and the other characterises all anthropological field works and the analyses are presented in the least subjective and predominantly objective terms. In this 'construction' of anthropological knowledge, the self immerses in the other with a raincoat; it may get wet at places, but is largely as dry as it was. Thus the other has been 'fully' seen; the self has remained 'unaffected', and from this strategy, it is believed that objectivity can come in analysis. And this approach—which I may call 'although I'm-in-the-world-I'm-not-its-lover'—is inculcated in every neophyte under the lesson of participant observation: if an investigator, newly wedded to participant observation, complains of the inbuilt paradox of the method, he is advised to 'minimise subjectivity and maximise objectivity', as if subjectivity and objectivity were items on the family budget.

Against the utopianism of participant observation, much experienced from the experience of an inability to keep the self in a water-proof dress, in some writings there is an explicit confession that the self, rather than distancing itself from the other, becomes other-icised. The experience of experiencing the other—the process also called 'nativisation of the anthropologist'—proves to the self the existence of universal predicaments, exigencies, life-passages, and emotivities [see, Rabinow, 1977; Danforth, 1982]. To be true to scientism, the self may hide the other-ness in it, refusing to acquaint its readers of its other-isation. In the edifice of ethnography, the big hall, where the self's other is jailed, is kept sealed; if the jinn of the other is allowed to escape, it would spread the notoriety of emotions/sentiments in a scientific work, thus mushrooming its merit.

The other-ness of the self principally increases with 'I was there' facts, and is directly proportional to the time spent with the people [Geertz, 1988: 1-24]. But the condi-

tioning role of extraneous variables should not be lost sight of. Who introduces the ethnographer to the people? Who arranges his meetings with the 'key informants'? Does not the ethnographer seek permission from the local bodies of power to conduct long-term enquiry? Does not he have a file of letters from his institution/organisation certifying his credentials? Does not the ethnographer, chiefly looking for the fountain-heads of knowledge and local information, pay more respect to the chief, school teacher, policeman, village level social worker, doctor, etc, not often realising that in a community some or most occupants of these roles may be outsiders, nurturing different kinds of conceptions and prejudices about the people? One may concede that the anthropologist is a powerless 'humble' learner of society [Evans-Pritchard, 1951], but the 'functionaries' who introduce him to the field, who care for him, who supply the 'background information', howsoever jaundiced it may be, allocate the anthropologist with 'influence' (if not 'power'), which makes him 'superior' to the people. Moreover, the cultural universe he transports to the field is equally a source of 'influence': he is white, reads and writes, wears denim, a terricot shirt, coat, hat, sun-glasses, shoes, carries a medicine kit, has equipment which dissociate voice from the self, or looks from the body, and, above all, is healthy.

Thus, in every field work, there is an asymmetrical relationship between the ethnographer and the people. And a likelihood exists that these 'specialities' of the anthropologist in terms of his connections may be urged upon by the people, who may desire him to take up their individual or collective cause, mediating with the police, or revenue official, or requesting the doctor to give them 'good' or 'more' medicines, or injecting them intravenously rather than prescribing oral medicines, or helping the locals to seek jobs. The anthropologist bears the 'hardships' of asymmetry, despite being placed on a 'superior' pedestal. A defiance of these relations mars the smoothness of data-collection. Aggressively the controversial diary may be churned out, or the incidents of 'using people' and 'being used' may be kept well-cloistered in memory. The self and the other cannot remain divorced ('raincoat approach') and at the same time, the self does not merge with the other mainly because of the fact that it is discovered in the company of the other ('communion approach'). But there persists an incessant struggle between the self and the other, where the former is defined and redefined as the latter unfolds its complexities. All this is rooted in a stratified situation, where 'structural visibility' of the anthropologist's stratum is highly vulnerable to the local demand situations.

IV

The field party—half fear-stricken, half dreamy—was received at Jabalpur railway

station (before noon) after a journey of sixteen hours, by the boisterous and energetic go-between, the official from the tribal institute, and his entourage. We were told of our appointment with the commissioner, Jabalpur division, who happened to be an anthropologist, having earned a doctoral degree by writing a text on Abuj Marias, another primitive tribe of Madhya Pradesh (Bastar district) and another hunting ground of Verrier Elwin. The students in the field-party, were given respite for an hour to freshen themselves, while the field supervisors were taken to meet the commissioner.

The commissioner, being an anthropologist, had a dutiful fascination with ethnographic specimens. As his earlier training was in geology, he loved fossils. The colonial architecture of his bungalow was here and there decorated with material cultural equipment and fossils. Truly committed to anthropology, he said that then existed more than four hundred scheduled tribes in India, each falling in one or the other development scheme, but it was ironical that a significant number of them had never been studied, and those studied—mostly from an ethnological perspective—in the colonial times by the British and Indian anthropologists were not touched upon after the independence. He was right for the Baigas our text was of 1939. Ethnographic traditions waned especially with the emergence of problem-oriented studies (touching smaller spheres of socio-cultural life), and so did the tradition of traversing far-off areas, often involving a difficult journey, in search of the people.

The commissioner talked about his experiences with the Baigas: he remembered a traditional healer (*gunia*)—named Ghoru—in Dadar Tola of Charha village.⁸ Like any anthropologist, he was picking oddments of the Baiga culture and society. "The Baiga males never chop off or cut their hair they keep tangled hair, forming some kind of a bun, on their occiput. If they ever cut their hair in traditional times, their marital chances were heavily jeopardised. Even now such a prohibition against cutting of hair continues." It was the scantily-clad Baiga, we had seen in Elwin's book, barely covering his genitals with a mud-impregnated *dhoti* and adorning his scalp with a jet-black bun that we had come to see. "Are they similar to what Elwin's monograph shows?" came an inquisitive question. "Yes! Some educated ones, whose number is very small, have changed; others are the same." Surely, socio-cultural life of the people tends to change at a lesser pace than their material apparatuses.

The students, waiting for their initiation ceremony to the ritual of field work, arrived to meet the commissioner and listen to a preliminary introduction to the Baigas and the agency established for their upliftment. The commissioner was a little disappointed to know that out of seventeen students only

being 'hard core scientists' for whom details of socio-cultural life had a peripheral meaning. The commissioner introduced the Baigas, almost in the same way he had rehearsed with us. But in this discourse, he added that every tribal community in India believed in what he called 'deluge theory', according to which the entire world was destroyed, then with 'supernatural intervention' it was re-created, and every tribe believed (and believes) that they were the first ones to have been created on the face of this world after the great catastrophe. This, perhaps, justified their claim to the physical area and resources (land, forest, water, etc.), and equally supported the anthropological label 'aboriginal' for them. The commissioner's generalisation of 'deluge theory' was yet to be tested. Perhaps he was relying on inductive logic—the Baiga theory of their emergence applied to every tribe.

V

Well before dusk, the field party left for Dindori, one hundred and sixty kilometres from Jabalpur town. The 'officials'—our 'go-between' from the Tribal Institute, the assistant project officer of the Baiga Development Agency, the research officer who had a cyclostyled manuscript on the Baigas in Hindi to his credit, an artist and a photographer—accompanied us, for they were to introduce us to the local community. The research officer had travelled the area several times, knew the local people and the key informants. With the jeeps and the bus plying on winding, steepish and sloppy roads, the weariness of field expedition was visible on our dusty faces. In the jeep carrying the 'crucial' and 'important' people, the discussion was on "Why Indian anthropologists do not carry out field work in these virgin zones, which offer immense potentiality of checking and cross checking their grand theories."

After a couple of hours of journey, I started having nausea and headache, thus temporarily withdrawing from the discussion, and was eagerly waiting to reach Dindori. As soon as we reached our destination, I jumped out of the jeep to look for a chemist's shop where I could buy a Metoclopramide tablet for arresting the symptoms, as our medicine kit was locked up in one of the equipment boxes. At the shop, like the general informality of Indian society, a man talking to the chemist asked me about the purpose of my visit. Since informational channels are closely knitted in small towns, it is difficult to either evade a question, or tell a lie. When the purpose of visit was disclosed in exceedingly simple expressions, making use of local categories and phrases, this man gave what he thought to be genuine and practical advice. "Why go to Charha? It is very cold there. Nothing is available. You should speak to the Patwari. He will send a message to the Baiga villages. Five-six of them will come here, and you ask

at every piece of advice, I was preparing to leave the shop as soon as he stopped talking. It was difficult for me to introduce him to our aim of 'studying' people in their 'natural' setting. Although it was night, quite a few had come to know about our arrival. Our roles were variously interpreted: we were likened to the medical research people from the ICMR (Indian Council of Medical Research) who periodically visited Baiga Chak to conduct health surveys.

Anthropological field work is always a matter of 'pub' meetings: every field worker, after accomplishing the 'crusade', ceaselessly repeats what it meant to be with the people. And 'oddments' of culture are picked—like, my people are polyandrous, or, drink soup of toad's limbs, or the women in my community are unusually lax about sex norms, or, the human skulls hunted by the people at one time are now kept in the local museum, or the women sing wedding songs in closed rooms and these songs have intense sexual reference. There may often be, in these conversations, scientifically inexplicable stories of black magic, primitive nosology, and cases of possession—to be narrated, with or without analysis. Hardships are romanticised, if an ethnographer does not fall ill in his field work expedition, the audience may doubt its veracity. "How could it be possible that if the people were infected with guinea worms, you did not contact them?" Since the neophytes had to be introduced to the essence of anthropological discourse, and also to help them gather the otherness that might form their contribution to the 'pub' talks, it was imperative for the teachers not to yield to their request of studying the town of Dindori. We were looking for the other and its otherness—something which came in Elwin's celebration of 1939.

VI

After a suitable rest at Dindori, the field party left for Charha, the first electrified village with some urban-like facilities, the beginning of the Baiga abode. Eighty kilometres from Dindori was the township of Bajar, administratively falling in Dindori tehsil. The officials in the block development office of Bajar were waiting to receive us, as a message about our trip had reached them. It was on the lawns outside this office that we had our first sight of Baiga men, who squatted in a circle and were talking softly. After the entire party had settled down in the office, I came out on the lawns to talk to the Baigas. One of the people working in this office, thinking that I—the 'sahib'—might be looking for something, came with me. "Sir, they are all Baigas. And those sitting there," he pointed towards another group of men sitting in the other corner, "are the Gonds. In some villages, the Baigas and the Gonds live together", he said as we walked towards the Baiga group, "but the Baigas have their own hamlet, generally

with their Gond neighbours. The Gonds are *kusan* (peasant), they are rich, they have progressed, but the Baigas are where they were earlier."

We reached the place where the Baigas squatted. They all stood up, greeting us with the Sanskrit salutation, which cuts across diverse socio-cultural situations, 'Ram Ram'. I needed them more than the official folding my hands, I responded to their salutation. The official—displaying the 'power' he had by working at the seat of power of that township which had under its control many Baiga and Gond villages—did not care to repeat the godly name. It was condescending for him to fold his palms before his 'subordinates'. A display of power is that when people salute you, you remain indifferent to both their salutation and their presence, at best, if you have a 'soft heart', or you know the people well, or they serve your needs or get you votes, you may recognise their presence. Your palms are eternally folded, or are clasped with arms stretched out and set below your navel, before your seniors, because they decide your *locus standi* in bureaucratic hierarchy, or your transfer to 'wretched places' away from your family. This 'official', like most others in tribal zones, considered the people *jungly*—holding the thick and involuted bun of one of the Baigas, he told me, "This is their characteristic mark." Out of the great humanism all anthropologists acquire by internalising the thesis of cultural relativism I reprimanded him for doing that and requested him to leave us. He had no option but to apologise for his action, leaving the scene a disappointed man.

A sign of relief did come after the departure of the interfering radical, but I immediately realised that I was not being looked at as a 'common ordinary man'. I was block development officer (BDO)'s 'man', perhaps 'superior' to him in certain respects because I enjoy the patronage of officials who determine his positional fate. The BDO shakes hands with me, he offers me a seat in his office, and when I have taken my seat he makes himself comfortable, his 'powerful' assistants serve me with tea and biscuits. And, moreover, I am different from the people in terms of ethnic group and dress. I speak the language of domination—bureaucratic and official language—and I hail from the centre of domination, which decides the lot of the peripheries.

"Why have you come here, sahib?" I found it extremely hard to answer this question, except for saying, with as much humility as possible, "I have come to live with you, to know how you live, how you have a family, how you worship your gods, how you settle disputes, etc." The Baigas were quizzically looking at me. The sorcery of anthropological work, presented in simple terms, aroused no conviction in them.

"From which village do you come?" My question was too general. They all came

from different villages of Baiga Chak and Bilaspur. In Bajag, Thursday was the market day. Being the only nearby township to Baiga Chak, the market was a big one with a large number of merchants coming from different areas, and it attracted a large 'colourful' crowd of buyers and visitors.⁹ On Friday, the crowd of the 'sellers', 'buyers', and 'visitors' assembled at Charha, 18 km from Bajag, the heartland of Baiga Chak. Saturday was the market day at Dhurkuta, ten kilometres from Charha, and on Sunday, it was at Pandaripani that they met. It is not that the crowd of 'buyers', 'sellers' and 'visitors' remained the same on all the market days, as spatial distance conditioned the movement of the people. One would find fewer people from Dhurkuta, for example, in the Bajag market, but the fact that the market provides one of the strongest information channels and a mechanism of transmission of messages is undisputed.

The Baigas with whom I was sitting had come to the market not especially to buy or sell any commodity—at the most they purchased a few bundles of *bidis*, some sweets (*Jalebi*), combs (*kakai*), etc. They came with the sole purpose of visiting the market—almost a fair—and if they met their relatives and friends, they exchanged news pertaining to their and neighbouring villages. Feeling that I might have intruded on the privacy of their conversation, I got up, saluted them and left, promising to meet them again in Baiga Chak. When I returned to the BDO's room, an 'official' of our party cut short my enthusiasm, "You seem to be in a hurry. In Baiga Chak you'll see hundreds of them, to the extent that you would be fed up of their presence." I was instantaneously reminded of Malinowski's *Diary*.

VII

Eighteen kilometres from Bajag was Charha, where we were to be stationed. Passing through the sandy levelled, motorable road, through the thick forests of Madhya Pradesh, it was a pleasant journey. The 'gate' to the Satpura forest range was aptly embellished with a large stone tablet on which certain stanzas from Bhawanji Shankar Misra's Hindi poem titled *Satpura ke lungal* ('The Forests of Satpura') were enshrined. These stanzas stressed the importance of forests in our economic, social, cultural, and aesthetic life, and vehemently condemned their destruction. The extraneity which gives birth to poetry is nature, the extraneity with which human beings seek relationships of dependence, subordination, and supremacy is nature. "From here it seems that this is a dense forest, but when you go inside you find that massive deforestation has taken place. Illegal felling of the trees has gone on under the nose of the forest officials. Laws must be made stricter to deal with the situation of deforestation," came the much-voiced suggestion from one of the 'officials'. But should not one try to combat the rat-race of consumerism which

is plaguing the Indian society, especially in the background of an endemic shortage of resources? To blame the tribals for destroying forests as a result of shifting cultivation is a naive and myopic way of looking at the problem of deforestation. The consumer patterns, generated in urban contexts, recklessly demand the resources, concentrated in tribal and rural areas, which denude the forests, on the one hand, and precariously expose its dwellers to several strands of exploitation, oppression, and proletarianisation, on the other.

VIII

It was around five in the evening that our bus and the jeeps reached Charha. Various 'functionaries' of the State government in this area, were well prepared to receive us. With concrete structures discreetly spread in the landscape, the area hardly gave the impression of an Indian village, generally an indisciplined conglomeration of mud and thatch habitations. We quickly learnt that Charha village, and its Dadar Tola—where the Baigas live—was up on the hills. At the foothills was the complex of facilities that the government had planned for the benefit and 'upliftment' of the people, and for the care and preservation of the forest.

To begin with, there were primary, middle, and secondary schools, with a hostel for the boys. In front of the big hall of the school complex, there was a wide, uneven ground with a net fixed on one of its corners for volleyball game, and to its right was a big pole with a swing—a characteristic of Baiga villages—and this was believed to ward off all villainous spirits. On the left side of the road, there were concrete houses for the teachers. The school complex was electrified, but not the teachers' accommodation. As we proceeded further, there were some houses for the deputy ranger (forests) and the guards working under him. The village had a dispensary, and was supposed to have a doctor, a pharmacist (locally called 'compounder'), and a nurse. But we learnt that the doctor had resigned, because he was not being transferred to a better place, and the new incumbent had not come for quite some time. The pharmacist was on leave, away to his native place and the dispensary was being looked after by a nurse, who lived in one of its parts with her less-than-a-year-old son. Her husband worked in a different town.

Moving further, there stood a beautiful model of a Baiga hut, with attached toilets to its room. Alas, the yawning gulf between the 'model' and the 'reality' the Baiga could not have afforded the luxury of such a hut. Close to it was the road, built by the forest department, leading to Dadar Tola. And then came the forest guest house. In front of this complex, across the road, lay the *maidan* where the Friday market fair took place. We could see stilted structures with canvas coverings, giving an idea of how the shops would be dispersed when the traders arrived. Near the road was the nullah of

Burmer river—here the people bathed and washed their clothes. Around a hundred yards from the market place, on the right, was the village well, and the people were advised to draw drinking water from it, rather than from the river. On the right of the market site, there stood an old dilapidated temple of Lord Shiva.

The functionaries in these areas, who generally belong to petty levels of hierarchy, have two duties to perform—firstly, the skill for which they have been selected to work in bureaucracy, and secondly, but most importantly, to 'look after' the visitors, who generally are 'big' officers, professionals, and, sometimes, the anthropologists. The last cannot have access to people in Reserved and Protected areas unless they are filtered through the bureaucratic apparatus; the approach—I pitched my tent in the centre of the village¹⁰—ideally to be adopted by the anthropologists, may not be feasible in most field situations. It is not always the case that the anthropologist comes with the 'officials' who settle him locally, but may bring with him a string of letters, or some phone calls may precede his arrival, which do the same magic of determining his station in the hierarchy, and also 'whose side he will be on'.

These 'functionaries' in remote tribal regions are generally the outsiders: the principal of the school was from Allahabad, the headmaster was from a town in Madhya Pradesh, the husband of the young nurse worked in a different town, the doctor was too attached to his native place to leave it for a tribal posting. And they all wanted to leave, they wanted posting to their home town, or 'better' places. Transfer to a tribal place, that too far-off, is interpreted as some sort of a 'punishment', to some it is a kind of demotion. How can they get a transfer to 'better' places? By boot-licking all kinds of officers, not necessarily of their own department, and the anthropologists are constrained to fall into the latter category.

In a country, where primordialities of caste, religion, region, language, kinship, and friendship affect the system of formal organisation, the most effective way to get things done through bureaucracy is to invoke one or the other primordial loyalty. Along with this, it is also believed that the officers are 'pleased' not by your work, but by the quantum of devotion rendered to them linguistically (by calling them 'Sir' or 'Madam', as the case may be, at the beginning and the end of a sentence), economically (by looking after them, serving them non-vegetarian food—particularly chicken—and arranging to give them a gift, often individually, when they leave), and socially (by giving them a patient listening, standing in the most obedient posture, never contradicting them, praising them even when they make common, and often stupid, conversations). Therefore, it was not surprising that when we had supper with the 'officials', the principal was trying his best to serve us there.

STATE BANK OF HYDERABAD

ABRIDGED BALANCE SHEET AS AT 31ST MARCH 1991

* excludes advances of Rs 23.50 crores shared out and includes advances of Rs 10.00 crores shared in with other banks by way of Participation Certificates.

is another belief in the Indian culture, if the officers (or the guests) 'over-eat', they may turn favourable. In spite of the warning signals issued by our stomach, the principal and other hosts were begging us to 'devour' more and more. One of us said, "Please don't insist, we may get an upset stomach." There came a ready-made reply, "Please don't worry, the entire jungle is 'available'." Alas, the forest was reduced to a defecational site. A few days later, my other colleague and I were approached by the local 'functionaries' to help them in getting a transfer from the 'lonely' Charha—the Charha devoid of 'facilities', the 'poor' Charha, 'undeveloped', 'lacking the glamour of a town', and, above all, 'inhabited by the primitives'.

IX

At night, there came a revelation. The research officer, who had travelled in the area earlier and prepared a 'shred and patches' kind of a monograph on the Baigas in Hindi, said that one of the people who worked with Verrier Elwin, when he again went to Baiga Chak in 1939 after the publication of his *The Baiga*, lived in Dhurkuta village. We were advised to engage him as guide and interpreter on a regular payment basis in case we faltered in understanding the Chattisgarhi dialect. Besides sucking his help when the need arose, I thought it would be profitable to interview those locals who had worked with the anthropologists, for this might throw light on how the data were actually collected: how the anthropologist behaved in the field; how was he looked at by the people; what kinds of weaknesses he had; what was his relationship with local men and women where he actually lived. All these facts have bearing on data collection and writing of an ethnographic report. Particularly I thought, it would be fascinating in Elwin's case, since we had found a person who was Elwin's companion in his sojourns.¹¹ Elwin's love for the tribals of India was undisputed. He wrote detailed monographs on various tribal societies after having adopted them,¹² he also married a local tribal girl, Kosi of Karanjia and after the tragic divorce, he married a Pradhan girl, Ila of Patangarh [Elwin 1964: 138].

The first item for the next day's agenda was to visit Dhurkuta, and engage Raghunath Das Panka, Elwin's informant, for our field work. Lest Raghu left for his field or became involved in some other work, it was imperative for us to leave for his village—about 10 km from Charha—early in the morning. Kudos to the forest department which had constructed a jeepable road, but the local characteristics in terms of gradients and climbs could not be altered significantly, the maximum speed a jeep could pick up was about 10 km an hour.

On the left side of the road, about four kilometres from Charha, lay the Baiga village Tantar. Close to the roadside entry point to this village, some forest guards were

making payment to the local men for their services to the forest department. Installed therein was a handpump where some women were waiting for their turn to fill their utensils with water. The 'officials' thought to halt there for a while. "Are they all Baigas?" an 'official' asked the forest guards. "Yes sir, they are all Baigas. Notice their tangled hair. The Gonds don't keep long hair, tied like this", the Baiga hood was reduced to 'keeping the bun'. The 'official' in a hurry to perform the harrowing initiation ceremony to field work, asked one of my students to take their pictures. "Stand up, come together", the forest guard ordered the Baigas. Young and old all stood up, there was no respect for the age, or the people, the Baiga hood was caught in colour roll. Like museum specimens, where dorsal and profile views are equally important, the Baiga men who had already offered their frontal view were ordered to 'turn about', so that their backs showing the tangled hair could be captured with our cameras for our museums and discourses, and slide shows. For the students the initiation ritual was horrifying. For those critical of the guinea pig treatment of people for anthropological, scientific and quasi-scientific works, it was shocking. It was a display of extraordinary power the 'officials' had on the people. The people remained silent sufferers of humiliation and abject disrespect that was meted out to them just because they were poor tribals, depending on the doles given to them by forest department and the government. The villages they lived in were 'forest villages', and not the revenue ones, and thus, were at the mercy of the forest officials.¹³

I was silent. The only *zweckrationalitat* that struck me was that in case I protested—in favour of the people—I would be spoiling our relations with the 'officials', and if they turned away, they might become nasty to the extent of turning the people against us. After all the people eked out their livelihood by remaining dependent on the 'officials' what could we anthropologists give them in terms of material aspects of life?

Along with this, we are taught that an anthropologist observes the natural behaviour of people, he is not an 'interventionist'. His role is to observe and record (as meticulously as possible) the human behaviour and cultural apparatuses the people have. An implication of this is if the forest officer beats the people by tying them to the trunk of a tree, you please do not stop him, but record why he is being beaten, with what is he being beaten, what kinds of abuses are being hurled at him, how the victims are weepingly apologising, who are the people witnessing this 'coercive display', etc. And if the people are suffering from diarrhoea and are singularly dependent on shamanistic treatments with no effects, this is the right time for you to make an extended case study of the sick. In case you suffer, god forbid, from the same ailment, very quietly consume a couple of furazolidone and metranidazole tablets, you are perpetually healthy because

you have done a detailed course on 'how to survive in the field', and after the training you emerge in charge of your body. Why not such courses—how to survive in field—be given to the people who actually constitute the field so that they know how to survive in it? And in case you intervene, either by challenging the authority of the forest officer, or by generously distributing anti-diarrhoeal drugs, you antagonise the seat of power, or change the course of 'natural' processes and events. As an interventionist, you cease to be an anthropologist, you become 'something' else—a 'social worker', a 'revolutionary', the 'leader of the people'. My quietness when the Baigas were being caught by the camera aperture was painful to me, I was helpless.

But when we came back to the jeep, I conveyed my protest—worded mildly—to the senior most official. He quickly understood my point and tendered an apology. "This will not happen in the future." Apology was not enough: what happened before us was simply the blade of a leaf of the thousand-year old banyan tree. I do not remember the journey from Tantar to Dhurkuta, the thoughts which strike every anthropologist—perhaps temporarily—about human inequality were enfolding me. If, today, we write about how people are being treated by the 'officials', and what they think about these seats of power, and if the 'officials' come to read our accounts, they might tighten their noose around the people's throats. Are we not exposing the 'powerless' people through anthropological work? The thought of meeting Elwin's informant returned to me as we reached Dhurkuta.

The message of our proposed visit had reached the village much before we arrived. At its outskirts was the school, an appropriate place both for the 'officials' (to display their power) and the anthropologists (to effectively communicate the aim of their visit). We were greeted with a welcome song, one of the teachers—the first Baiga of Baiga Chak (Dhurkuta village) to have been educated and absorbed in the education department—guarded us to a small rostrum, having chairs and benches, perhaps prepared to welcome 'officials' and visitors. The other teacher (a woman of Panka—the weaver caste) went to a small hut in front of the school to prepare tea for us. Budh Singh Maravi—the Baiga teacher—started telling the 'officials', with boundless humility, about the school, the performance of his students, the non-existence of various facilities, in a nutshell, about the hard circumstances in which the school functioned, nevertheless it produced promising results.

The message for Raghunath Das Panka was sent. And there came a thin man clad in a soiled *dhoti* and banian. He seemed to resemble the medieval poet of Bhakti cult, Kabir. What a coincidence—Raghu belonged to the Kabirpanthi (followers of the cult of Kabir) branch of the weaver (Panka) caste. He was old, but definitely not as old as we thought him to be. Speaking chaste Hindi,

ornamenting his expressions with Sanskrit words, he definitely looked educated. Yes, he was educated till fourth standard; had visited quite a few small and large towns of Madhya Pradesh; and besides Elwin, he had also worked with one P C Ray of the Anthropological Survey of India for six months from February 7, 1956. He started his discourse with the following reminiscences:

"P C Ray reached Dhurkuta on February 6, 1956. He came on foot from Bajag. His luggage was brought by some labourers. In those days, the daily wage of a male labourer was twelve annas (seventy-five paise); the women were paid eight annas (fifty paise).

The next day, he called me. I went to meet him at the forest guest house. Everyone was afraid of the forest employees in those days... He started asking me about Elwin... He gave me a letter written for me by Pal, the ranger at Dindori, which said that I was to do whatever work Ray and his team expected from me, and I would be paid Rs 25 per month. I happily accepted the offer. From the next day, I would sit with Ray Sahib from morning, eight O'clock, help him in taking to the Baigas—translating the Baiga language into Hindi, and vice versa. A few days later, Ray Sahib asked me to collect the healing and exorcising procedures (*guniyai*) of the Baigas. I took some notebooks from Ray Sahib, and went to Gotam Baiga of Dhurkuta. Gotam was also called by the name Vandara. He was very old, 80 years or so. Gotam was not prepared to tell me the *guniyai* spells. I spent my own money and bought a bottle of liquor (*daru, sarab*) for him. These Baigas, you will come to know, do not tell anything unless you offer them *daru*. Because I neither drink nor ferment liquor, I had no option but to buy a bottle for Gotam... I spent eight days in writing the *guniyai* rituals... in total, they covered six notebooks... then I read them out for Ray Sahib... It took three days, three hours each day, for a complete recital. Ray Sahib was very happy and he gave me an *inam* (prize) of Rs 25. Ray Sahib wanted to see the tattooing rituals. I took him to Sukhiya Baigin, who told him everything about tattooing. He was also keen to observe a Baiga marriage. We arranged the marriage of Chikhu Baiga for which Ray Sahib offered Rs 500. Ray Sahib was very pleased with me... My salary was raised to Rs 120... Was not Raghu an anthropologist in the making? He told me, "If you want anything to be written on these Baigas, I shall write it for you. I know their whole life. I have lived with them".

Raghu was the chairman of the Baiga Chak Samiti (Association of Baiga Chak). He lived in a village which was predominantly of the Baigas. Being the chairman he was called by the people to settle their disputes, mainly arising out of elopement and extra-marital sex. Having worked with two anthropologists, he had an idea of the sort of information we people needed. "Sahib, please write down. These Baigas are divided into twelve *gotra* (clans) and thirty-two

joti (castes)", his ethnographic lecture began with a systematic note. I explained to him that what we wanted was not what Raghu knew about them. "We want to live with the Baigas of Dadar Tola, and talk to them. We would highly appreciate your joining us if you are not too busy and you may leave us whenever you want." Since Raghu had entrusted his sons with agricultural duties, he was happy to be with us, and was ready to leave his village that very day. While returning, Raghu was sitting next to me, and I was smoking *bidis*, abandoning my cigarette packet for the rest of stay in Baiga Chak. The 'officials' directed us to pay Rs 10 per day to him, as per the wages of the daily labourers. But Raghu was not a 'labourer': he was the 'comrade-in-arms' of the anthropologists.

The 'officials' were preparing to leave, and we had started heaving sighs of relief. But, we were told that since it was the forest area, various forest officers might visit it: so, our liaison between the 'people' and the 'officials' would remain ceaseless. The senior-most official, who had realised my sentiments in Tantar, repeated his apology, "I am extremely sorry for the Tantar incident. As an anthropologist, I subscribe to the truth that all human beings are equal, and we have no right to humiliate people just because we happen to be advantageously placed. I have done my field work with the Kamars (of Raipur district, Madhya Pradesh) and I have seen their poverty. Their number is decreasing. In lean periods, they have nothing to eat, not even rats. But, you know, if, on the one hand, I am with the 'people' as an anthropologist, on the other, I am a bureaucrat. Sometimes the bureaucrat in me and its 'power intoxication' manifests itself. But it will not happen again." The anthropologist realises the notion of equality; the anthropologist-administrator has to combine, often paradoxically, two roles. But 'power' emerging from an alliance with bureaucracy and/or urbanity of the anthropologist runs through the entire field work. The anthropologist is 'superior' to the people, if not in anything, at least in the 'power' of discourse.

(To be concluded)

Notes

[I am thankful to Caroline Humphrey, my supervisor, Christopher Pinney, Stephen Hugh-Jones, Piers Vitebesky, and Declan Quigley for going through this paper, and making valuable suggestions. I acknowledge the help of Surinder Nath and my students, Poonam, Priti and Sreedevi, during our stay at Baiga Chak. I am indebted to Kumkum Srivastava for editing the manuscript.]

1 Malinowski (1922). In recent writings also, 'total immersion in the community' of study is described as cardinal to anthropological work; Gellner (1988: 26), for example, writes: "The future (of anthropology) seems to me to lie in a frank return to the old theoretical issues, pursued with a determination to maintain that high level of empirical co-scientiousness established by the Bap-

tist (total immersion in the community) school of fieldwork".

2 See, Rabinow (1977: 5).

3 What I have in mind here is the usual, culturally constituted behaviour, unaffected by the 'reactivity syndrome'.

4 The famous diary of Malinowski (1967), which created furor in anthropology, was not written to be published. An unfortunate consequence of its publication can be envisaged here: ethnographers might not express their sentiments and experiences and some delicate events of the field work, frankly in their diaries.

5 Baiga Chak is the name of an area which lies on the southern forest range of Mandala district. Also called Chogan Chak (the word Chogan means *maidan*), it consists of fifty-two villages, having 1,195 Baiga families with 6,943 people: the average size of a family being 5.8.

The team to Baiga Chak was sponsored by the Department of Anthropology, University of Delhi. It consisted of a teacher (Surinder Nath) and fourteen students of physical anthropology. For the physical anthropological work, a laboratory assistant was also sent. I was the field supervisor of social anthropology students, who numbered three. The latter were to collect data for their dissertations on family and kinship, women, and ethnomedicine respectively.

6 In the Fifth and the Sixth Five-Year Plans, seventy-two communities were identified as having problems like declining, or stagnant, population; pre-agricultural level; low literacy; and backwardness. They were separated from the main list of the scheduled tribes for specific programmes of development, alleviation of poverty, and safeguarding of their interests. These communities are called 'Primitive Tribes'.

7 Elwin's *The Baiga* was a result of seven years association with the people [1939: lxviii]; I would not call it 'field work', because Elwin wrote, "For me anthropology did not mean 'field work': it meant my whole life. My method was to settle down among the people, live with them, share their life as far as an outsider could, and generally do several books together. My Baiga book took me seven years, *The Agaria* ten" [1964: 142].

8 An encounter with Ghoran Baiga is described later in this article. His picture has been reproduced in a booklet titled 'Baiga' (in Hindi, on page 2), published on November 12, 1982 by the government of Madhya Pradesh, on the occasion of late prime minister Indira Gandhi's visit to Amarkantak.

9 I was reminded of the description of African markets, see, Bohannan and Dalton (ed) [1968].

10 After Malinowski's Trobriand field work (1922).

11 The name of this man—Raghnath Das Panka—does not occur in any of the twenty-six monographs written by Elwin.

12 For Elwin's publications and an appraisal of his works, see, Pradhan et al (eds) [1969]; Misra [1973]; Rustomji [1988, 1989].

13 Out of 52 villages in Baiga Chak, thirty-nine were forest villages (*vanagram*). The total population of these villages was 16,849, out of which, as mentioned before, 6,943 were the Baigas.

Women's Labour in Japanese Economy

Peter Custers

Japan has for long prided itself on, and has been praised for, maintaining a system of life-long employment with security of jobs and steadily increasing incomes. This paper, based on a month-long tour of factories and workshops, finds a systematic approach to exploitation of women's labour in Japanese capital's international offensive and the Japanese government's policies relating to women labourers.

SEXUAL DIVISION OF LABOUR IN A TOBACCO COMPANY

"I WORK eight hours per day, five days per week. The hours of my domestic labour? Those I have never calculated." Kawanosan is employed by the Japanese tobacco processing company which markets the brand-name Cabin 85. Contrary to the vast majority of women in Japan she has got a fixed job, having worked for the same company for the last 25 years. Like all other female labourers, she too carries a double burden of labour. When she returns home at 6 o'clock in the evening, after completion of a day's work in the factory, she continues to toil, until she retires to bed by 11 o'clock at night. At dawn, she gets up before 6, and by the time she leaves home to go to the factory, she has already toiled for an hour and a half. The total labouring burden of Kawanosan thus amounts to 15 hours per day.

Japan Tobacco is a company with a long history of government control. From its founding in 1904, the company for decades was ruled directly by the state. It enjoyed a monopoly on the Japanese market. And although the enterprise was privatised in 1985, its shares are still held by the Japanese government. During a guided tour of the factory, we, two Dutch journalists, are struck by the high level of mechanisation. It is only in the section where quality control of the cigarette packets takes place that work is somewhat labour intensive. Here the work force predominantly consists of women. In all other sections automation is complete.¹

The management of Japan Tobacco grants us an interview with female employees. It turns out to be a peculiar event. The men of the personnel department who are present, constantly push their own opinions, when we pose questions to the female labourers about health problems, labour conditions, etc. When questioned why women workers frequently suffer from muscular pains, Iiatsan who is the factory's nurse, responds that these are caused by "thin clothes, lack of sleep, and women's physique". When we continue prodding, she explains that the pains are due to the fact that women in the packing department need to "continuously repeat the same movements".

The atmosphere becomes heated when we table the theme of the sexual division of labour and domestic work inside the company. Kamibetsunawa draws up balance sheets at the financial department. What is her first task when she enters her office in

the morning? "Preparing tea, even before the official start of the working day. Every day I serve tea to my colleagues three to four times, and I am also in charge of cleaning the cups. In other departments too, women are solely responsible for preparing tea." Are women being paid for this? A male guide responds: "No!" One of the men gets up, and a short while later he returns with a pot of fresh tea. He says: "Tea made by women, after all, tastes better".

I will discuss the role of women's labour in the development of Japan as an economic superpower. The expansion of capital investments by Japanese multinationals abroad has been phenomenal in recent decades. Increasingly, also, the multinationals are looking towards south Asia for profits. What has been women's historical contribution to the industrialisation of Japan? How does Japanese capital elsewhere in Asia engage women to facilitate its international offensive? And what place does the Japanese government reserve for women in the country's economy? A review regarding a systematic approach to exploiting women's labour, on the basis of a one month tour of factories and workshops inside Japan.

ELECTRONIC COMPANIES POLARISATION BETWEEN WOMEN AND MEN

Let us first discuss the position of women in the electronics sector. Before travelling to Kyushu, an island in the south renowned to be Japan's 'Silicon Island', we are given details about the sector's international expansion at the headquarters of *Denki Roren*, the national trade union federation of company unions in electronics. The comprehensive government figures cited by the representative of *Denki Roren*'s research department speak for themselves. In the period from 1982 to 1988, the number of investments by Japanese electronic companies abroad has doubled, while the value of these investments has increased *five fold*. Consequently, the share of foreign production in the output of the electronics' giants has significantly expanded during the 1980s.

The external drive, further, was preceded by a 'flight', from the late 60s, to Kyushu, which island until then had been marginal to the Japanese economy. Companies like Mitsubishi and National Electronics Corporation (NEC) opened their first factory premises for the manufacturing of integrated circuits (ICs) near Kumamoto city, in 1967 and 1969 respectively. Other electronic giants followed suit. Kyushu developed into a replica of the United States' Silicon Valley,

which for years has been seen as the Mecca of international entrepreneurship. According to the study of the Japanese researcher, Fujita Kuniko, published in 1988, 44 per cent of all integrated circuits in Japan are produced on the mentioned island.² The same author states that companies prefer to employ female high school graduates in the Kumamoto prefecture, for example, they made up 95 per cent of the whole labour force of electronic companies in the early 1970s. Exploitation of female labour ensured that companies manufacturing semi-conductors could rapidly accumulate

This picture, however, has changed, and Fujita Kuniko uses the terms 'polarisation' and 'the marginalising of women' to describe recent developments in Kyushu. According to her, the sexual composition of factory personnel is no longer the same. The data she uses show that the percentage of female workers had declined to 50 per cent in 1986, the basic reason being the fact that the number of newly recruited male employees by far exceeds that of new women employees. In fact, the latter probably only applies to companies which occupy a top position in the hierarchy within the electronics sector. Still, the picture sketched by Kuniko for Kyushu largely concurs with what is known about electronic companies elsewhere. The situation in factories in Scotland where wafers are manufactured, for example, is similarly polarised. In both wafer producing factories and assembly-plants for chips, a sharp polarisation exists between technically highly skilled male personnel taking care of machine maintenance and repairs—and women performing labour-intensive, semi-skilled tasks.³

A striking example of the above is the division of labour at the factory compound of Fujitsu Electronics near the city of Kagoshima, where 600 men and 400 women are employed. The managers in blue uniforms who accompany us during our tour of the factory, openly talk about the strict division between men's and women's tasks. Cutting wafers is exclusively done by men, as is the maintenance of machines. Quality control of the chips, on the contrary, is performed by women, in a dust-proof room. Wrapped in synthetic dresses, anonymous figures stare through microscopes, checking whether the thin threads have been properly attached to tiny plates. Observed from behind a glass window, the spectre seems surrealistic. But why is controlling the quality of chips through microscopes exclusively a woman's task? The response is stereotype. One of the

uniformed bosses says: "This work is very suitable for women, since they are used to do stitching and embroidery. The work requires enormous concentration, and men are not fit for such monotonous labour." For Fujitsu's bosses, the sexual division of labour is a reality imposed by nature, fixed.

LABOUR GROUPS AT FUJITSU MINIMISING PRODUCTION ERRORS

Five women are brought into the managers' well-furnished room. Four of them work in the dust-proof space which we have just passed a few minutes ago. We are allowed to briefly interview them during the break, under the watchful eyes of the bosses in blue. After posing our regular questions about their labouring burden—30 hours of overwork per month appears to be quite normal—we cautiously try to introduce the theme of occupational hazards. What kind of diseases do women suffer from as a consequence of the monotonous work? "Sitting is most tiresome, I wish I could move. Because I am constantly chained to my chair, my shoulders are tense", says one of the women. With a smile, she adds a complaint about the work pressure: "If I want to visit the toilet during working hours, it's considered an impermissible interruption. Women are forced to wait until the break, which is both physically and mentally exhausting."

Does not the peering through microscopes day after day, cause eye diseases? One of the women denies: "I have worked here for ten years without problems. If the microscope is adjusted well it's all right, otherwise it hurts. In the morning, however, it takes some time before one's eyes get used to the apparatus." At international seminars where the working conditions faced by women in the electronics sector have been discussed, it has been stated that the job of peering daylong through a microscope, leads to a deterioration of eyesight, generally within less than two years.⁴ Within Fujitsu company there seems to be an ongoing controversy over the question. Says one of the women workers: "Just recently, the director has assured me that if the microscope is adjusted well, it can do no harm to my eyes."

The managers relax when, after the women are sent off, the topic shifts to 'labour groups'. A structure of small labour groups is common to all major automobile and electronics companies in Japan, and is used to promote production efficiency. "In 1985, Fujitsu introduced a 'small group structure' as a consequence of which the number of chips showing defects has been reduced to an absolute minimum." The system, so the managers admit, engenders mutual distrust and competition between labourers. Yet in contravention to the just stated historicity, they assign the system a status of permanency: "It is a feature of Japanese culture", they insist.

SILK AND TEXTILE PRODUCTION: THE BASIS OF INDUSTRIALISATION

Today's widespread employment of women in the electronics sector in Japan has its pre-history. Ever since the early start of industrial development, Japanese companies showed a definite preference for females. From 1868 onwards, the country underwent a rapid process of modernisation—the 'Meiji Restoration'. The first silk factory arose in 1872, a decade later the first cotton spinners, and by the turn of the century Japan had already become a fierce competitor in textile commodities on the world market. These exports enabled Japan to import machinery for the founding of other enterprises. It would take more than 50 years before sectors like steel and chemicals were to elbow out textiles as the leading sector of Japanese industrialisation. The factory owners, further, used agents to recruit young peasant daughters as labourers. As famine prevailed in the countryside, the agents could easily find heads of peasant families willing to temporarily surrender their daughters. Often the agents acted as moneylenders, providing hungry peasants with loans to be repaid from the wages of their daughters. Until the 1930s, young village women constituted 80 to 90 per cent of the workforce of Japanese textile mills.⁵

The working conditions in the early silk and cotton spinneries were not essentially different from the miserable conditions prevailing in European industries in the 19th century. Like here, the working day was inhumanly long. Female labourers of silk factories had to toil 14 hours per day. The first strike erupted in Japan when an attempt was made to extend the working day, from 14 to 14½ hours! Labouring times of women in cotton spinneries were comparatively shorter—each shift lasted 11 to 12 hours—but women were frequently forced to be on the job for 25 hours continuously. The situation remained unchanged until 1929, when nightwork was prohibited by law.⁶ The health requirements of the women workers, moreover, were badly ignored by the mill-owners. Particularly notorious was the lack of fresh air inside cotton weaving factories. The owners held it necessary for the quality of the cotton clothes, that the air inside the mills was moist. The dark factory halls with machines were filled with steam, water would drip down from the ceiling, and the windows were kept tightly locked. Female labourers had to endure such conditions for 12 long hours each day!

Given the lack of rest, the long working hours and the unhealthy environment, it should not surprise anyone that the incidence of illness was very high. Many female textile workers—just like their sisters in Germany and England—died of tuberculosis. According to a governmental investigation conducted around the turn of the century, a quarter of all deaths in dormitories of textile mills was caused by tuberculosis. The disease frequently induced

women to return to their villages. And it is not surprising either that many women tried to, literally, *escape* from their inhuman existence as labourers. An official investigation into one company located near Osaka—brought out that over half of the women labourers employed here in the year 1900 escaped. Statistics about other companies also show a large turn-over. The female labourers knew they were taking large risks by trying to flee. In case they were caught, they were not just beaten up, but forced to march nude through the factory-premises, by way of punishment. Yet apparently, many saw escape as the only possible road towards freedom from enslavement.⁷

A historical retrospect further reveals that methods to control the workforce which today are standard practice in Japanese companies were tested rather early. Take for instance the group-competition we encountered at Fujitsu Electronics. According to a publication of the American Cornell University, which cites the report written by a labourer of a cotton factory in the beginning of this century, group competition was commonly promoted in the early textile mills. Informal games were held, pitting one group of women hailing from the same district against those hailing from another district. The factory management also stimulated production competition. Paltry prizes—flags, towels, cosmetics, etc—were offered to the victors.

A second idea still in vogue is that of forced savings. Below we will see that the idea presently is being exported to other Asian countries, where Japanese companies build new factories. The forced savings-system too can be traced back to the learning phase of the Japanese capitalists. As today, the mill-owners used to pose as surrogate parents. Ostensibly to help their families, and partly to acquiesce the parents of the village girls, the women workers were obliged to save a fixed amount of money each month. In reality, the savings system primarily served to tie the female labour force to the factory.

The structure of dormitories was a third pioneering idea which contemporary multinationals like Toyota have borrowed from their grandparents. It illustrates well the 'benevolence' of the fatherly owners towards their daughter-workers. The dormitories where the young women from the villages were brought together, were generally located inside or near the factory compound, and they were constructed in a manner as to make escaping very difficult. Thus, many mills were surrounded by walls beyond which broken glass, bamboo sticks and barbed wire were placed as extra barriers. "Anyone who dared to jump over the fence not only risked bodily injury, but usually was caught immediately and brought back!"⁸ Half of the backyards of the dormitories faced a river or some other waterbarrier. Inside, supervisors kept a close watch of the girls' doings. In short group competition, forced savings and fenced dormitories are all key concepts

M-CURVE: OFFICIAL VIEW ON WOMEN'S LABOUR

Let us now resume our story about Japanese women's labour today. In official statistics, the employment of women of various ages is depicted like an M-shaped curve. Millions of young women after graduating from high school are for several years employed in banks and offices as full-timers. When they marry or bear their first child most of them disappear from the labour market, and only return once their children have grown up. Many middle-aged women in Japan are part-time labourers—they constitute the second peak in women's employment. The number of female part-timers has grown phenomenally since the 1960s. It now stands at about 8 million.

Several critical comments may be about the so-called 'M-curve'. First it ignores the fact that aside from the mentioned categories there is a significant and increasing number of women who are engaged as 'temporary labourers', via so-called *manpower agencies*. The expansion of manpower agencies is promoted by the government. Thanks to a law introduced in 1985, the number of such agencies within one single year has more than tripled—from 2000 to over 7000. The law exempts employers from any responsibility for people they recruit via the manpower agencies. An investigation carried out by trade unions has concluded that women engaged as 'temporary workers' in the service sector—two-thirds of the workforce in the sector are women—are deprived of any supplementary allowances. They do not even receive a bonus, though the length of their working time hardly differs from that of full-timers.⁹

Nor does the M-curve properly highlight the wage-labour which many Japanese women continue to perform as homeworkers. The number of outworkers sewing for an entrepreneur, assembling electronic components or doing packing jobs, seems to have tumbled during the last 20 years. Estimates of their numbers today range from 1 to 2 million women. Homeworkers, however, do constitute a separate age category, for the group is largely composed of women with small children, i.e. those whose age forms the down-turn in the M-curve. Homeworkers' wages, moreover, are undoubtedly the lowest of all categories of female labourers in Japan. According to a woman professor we spoke to in Fukuoka city, Hayashisan, the average is 357 yen per hour, i.e. merely a quarter of the wage drawn by a male employee in fixed service.¹⁰

The M-shaped curve thus provides an incomplete picture. And yet it does give us a first indication of the secondary position held by women in the Japanese hierarchy of wage-labour. Japan has for decades prided itself on, and is praised for, maintaining a system of life-long employment, with securi-

The above-cited facts demonstrate that the story about the 'life-long employment system' is highly propagandistic: it applies to a section of male labourers only, while excluding almost all women labourers! To repeat—when young women marry, they are generally induced to leave their office-jobs, or if necessary are forced to resign. And when, after raising children for 10 or 15 years, they wish to rejoin a paid job outside the home, they have got no other choice but poorly-paid labour as a part-timers.

PART-TIME LABOUR AS POLICY

Some analytical points may be added about the position occupied by part-time labourers. I have already mentioned their high number, and the fact that the occurrence of part-time labour is a rather recent phenomenon in Japan. Now, the rise of part-time work is no coincidence, but the result of government policy. From several interviews conducted in Japan, it emerges that the growth was specifically promoted from the early 1970s onwards. At the time, companies had to cope with the circumstance that fewer and fewer high school graduates were available as new recruits. The capitalists started to look for fresh source of cheap labour, and they found the solution in the form of part-time labour by middle-aged women.

The expansion in the number of part-timers was hardly spontaneous. In 1960 already—we are informed by a booklet about discrimination against Japanese women¹¹—the Economic Council of the government in Tokyo devised a plan in which the employment of women "who constitute half of the national population" was advocated. The plan emphasised the need to utilise the capacities of middle-aged women who "wished to work again". Moreover, the authors of the plan opined that women should resign from their jobs when marrying or at the birth of the first child. Clearly, the Economic Council devised the M-curve for the entrepreneurs, in order to guarantee the availability of a flexible reserve of female workers.

The same thinking has since been enshrined in official laws and amendments implemented by the Japanese government, as in the so-called 'Equal Opportunities Law' which became operative in April 1986. This new law was a necessary outcome of the signing, by the Japanese government, of the United Nations Convention about equal opportunities between women and men. The Convention, amongst other things, contains clauses about 'equal remuneration' and the 'equal valuation of labour of equal value'. Japanese women's groups, however, argue that the 1986 law sharply *contrasts* with the UN-Convention. Instead of the abolition of inequality between women and men it leads to more discrimination against women. One of their criticisms is that the law prohibits discrimination at the moment people are

ding promotions and the allocation of functions within enterprises. Thus, it is considered to legitimise the use of women as cheap part-time labourers.

In order to gather a more concrete understanding about the position of part-time workers in Japan, we had prolonged discussion with Tamura Katsuko, who for 15 years has been a salaried employee of the retail-trading company Sunny. At present, she is responsible for the training of cashiers at the company's headquarter in Fukuoka city. Katsukosan herself is not a part-time labourer. She enjoys a full-time job with a decent salary—net 170 to 180 thousand yen per month (roughly \$ 900). Yet she is very conscious of the unjust, secondary economic position of most Japanese women. To make her own husband who holds 'very stereotyped ideas about male and female roles' share in the burden of household tasks, she waged a long struggle inside the family. Proudly smiling, she tells us that at one time she simply forced him to wash and cook like hers, by refusing to do any of the chores. Her level of consciousness has been influenced both by her own family background—her father was married into her mother's family—and by her membership of a women's group, called Agora.

Tamura Katsuko explains that Sunny consists of some 60 supermarkets spread across the island of Kyushu. Out of a total number of 1,500 staff members and personnel—a majority of them are salespersons and cashiers—no less than 1,200 are part-timers. Our interviewee could not give us precise figures about the company's profits. Katsukosan: "Just like other Japanese retail traders, Sunny does not disclose profit figures. Whereas the company of course has to report to the tax office, the workers are not informed. My own estimates are 50 billion yen for the total yearly turn-over, and some 20 per cent for the average profit margin."

What about the wages and the working hours of part-time labourers? "The wages of the part-timers clearly differ from those of full-timers, but there also exist differences between part-timers themselves. For example, the wages of cashiers who are on their jobs in the morning are lower than those of cashiers who work in the evening. Part-timers who have to serve fish and meat receive more money than part-timers serving ordinary food. For a new part-timer, the average wage lies between 490 and 620 yen per hour (2½ to 3 dollars). The wage-level of an experienced part-timer lies slightly higher. After one year, wages rise by 15 yen ... Eighty per cent receive less than 550 yen per hour."

Characteristic of the position of part-timers in Sunny as in other enterprises is not just the fact that their wages are relatively low and that only they are paid on an hourly basis. They are also deprived of most supplementary payments received by regular

OSWAL AGRO FURANE LIMITED

Regd. Office:

434, Sector - 37A, Chandigarh - 160 037

FORM IIA

NOTICE

It is hereby notified for the information of the public that OSWAL AGRO FURANE LIMITED proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under Sub-Section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval to the establishment of a new undertaking/unit/division. Brief particulars of the proposal are as under:-

1. Name and Address of the Applicant : OSWAL AGRO FURANE LIMITED
Regd Office: 434, Sector 37-A,
Chandigarh - 160 037
2. Capital Structure of the applicant organisation : Capital Structure as at 31.3.1990:-
(Rs)
Authorised Capital
2,00,00,000 Equity Shares of
Rs 10/- each 20,00,00,000
Issued, Subscribed and paid-up
1,80,00,000 Equity Shares of
Rs 10/- each fully paid-up 18,00,00,000
3. Management structure of the applicant Organisation indicating the names of the Directors, including Managing/Whole time Directors and Managers, if any : Mr T K A Nair, Chairman
Mr P S Bajwa, Director
Mr Gurcharan Singh, Director
Mr B K Taparia, Director
Mr P K Ahuja, Director
Mr Anil Bhalla, Director
Mr R K Singhania, Director
Mr Abhey Oswal, Managing Director
4. Indicate whether the proposal relates to the establishment of a new undertaking or a new unit/division : The proposal relates to the establishment of a New Unit
5. Location of the new undertaking/unit/division : Village Bhasaur, Tehsil Dhuri,
Distt Sangrur,
Punjab
6. Capital structure of the proposed undertaking : Not applicable
7. In case the proposal relates to the production storage, supply, distribution, marketing or control of any goods/articles, indicate :

| Name of goods/articles | Proposed Licensed Capacity (M.T) | Estimated Annual Turnover (Rs in Lacs) |
|---------------------------|----------------------------------|--|
| i) Vegetable Oil | | |
| Product Vanaspati | 22812 | 9124.80 |
| ii) Acid Oil—(By product) | 617 | 64.78 |
| iii) Soap—(By product) | 333 | 33.30 |
8. In case the proposal relates to the provision of any service, state the volume of activity in terms of usual measure such as, value, income turnover etc : Not applicable
9. Cost of the Project : Rs 10 crores
10. Scheme of finance, indicating the amounts to be raised from each source :

| | |
|---|---------------|
| i) Equity Capital through Rights Issue | —Rs. 8 crores |
| ii) Loans from Financial Institutions/Banks | —Rs. 2 crores |
| Total | Rs. 10 crores |

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhawan, New Delhi, within 14 days from the date of publication of this notice, intimating us his views on the proposal and indicating the nature of his interest, therein.

For OSWAL AGRO FURANE LIMITED

Place: New Delhi
Dated: 11th May, 1991

R K SINGHANIA
DIRECTOR

wage is rather complicated. It consists, except for a basic wage, of a whole series of allowances—a holiday allowance, a family allowance, etc. Part-time labourers are only paid a bonus, which is paltry. In Sunny's supermarkets "it mostly amounts to 1,000 yen after one year's service, 1,200 yen after 10 years! Besides, women part-timers are entitled to a small summer-bonus. Those whose service has not yet lasted a full year are handed out a small present at the year's end."

The working hours of women part-timers in Japan, further, are extremely long. Often, they toil merely half an hour shorter than full-timers, and their working week generally is equally long. At Sunny, the working hours of various categories of part-timers vary greatly. Katsukosan: "Part-time women labourers work under a contract which is valid for one year. Each contract is signed on an individual basis, via negotiations at the moment of entering service, between the management and each woman individually. Most of the women work four hours per day, but some do as much as eight hours. Those with the longest working hours serve 22 to 25 days per month, five to six days per week."

Has an attempt ever been made to negotiate the labour contracts collectively? What is the role of the trade union, does it fight for improvements. "Within the trade union of Sunny, there indeed exists a section of part-time labourers. Those whose service period exceeds one year, automatically become members. The union is a company union and it closely co-operates with management. The fact that women part-timers are admitted is a consequence of a rumour which earlier circulated to the effect that *Sohyo* (the trade union centre linked to the Socialist Party of Japan) were to float a trade union of part-timers. Sunny's management then got frightened and decided to allow part-timers join the company union."

We, lastly, broach the subject of the large turn-over in personnel. Part-time labourers, Katsukosan states, mostly do not stay with Sunny for more than one or two years. They then leave one by one. The reasons? Katsukosan first opines "They find better jobs or it happens that they drop out due to human conflicts, because of frictions with other women labourers. Strong and weak characters tend to clash." Only when we pose more questions, about the work pressure put by management, the truth comes out. Says Katsukosan: "Cashiers are trained so as to be able to handle customers. The instruction guidebook contains detailed prescriptions about how to address customers, how to hand over money, how to behave when a customer passes the counter, etc. The management has calculated everything—even the number of seconds a cashier is to devote to one customer, and the work schemes are arranged in accordance with these data.

it probably is one of the reasons why so many of them leave." Even human communication has been mechanised in Sunny's supermarkets.

Women in Japan form one large, elastic labour reserve. They exactly fulfil those two criteria which Marx cites in *Capital* for the industrial reserve. Women part-time labourers can be shifted between various sectors of the economy. They are, in the words of a Japanese newspaper, like 'disposable chopsticks': they can be laid off at any time. Part-timers also fulfil the second criterion, namely, a negative impact on the overall level of wages. Because part-timers are paid such low wages—according to the inflated figures of the ministry of labour it is 70 per cent of that of regular female workers¹²—their employment exerts a downward pressure on the general level of wages in Japan.

WORKERS AS HOUSEWIVES

During the interviewing of women in Japan, household labour was a frequently recurring theme, alongside that of the work pressure faced by women on the shop floor. To the question 'How many hours a day do you perform household tasks?' we got the routine answer "Those I have never calculated." Apparently, women labourers themselves discount a part of their work. That labour which they are not paid for, is not recognised even by them. Once we clarified our question, women set out calculating. At what time does a mother of small children, performing wage labour, rise at dawn to prepare the family's breakfast? At 5 o'clock, at 5.30? In most cases, she would devote 1½ to 2 hours to the household before factory or office-time. And after returning home, exhausted by a day's work at the assembly-line, she generally has another four to five hours to go. The work of women who combine a double task never ends.

The total labouring burden of Kawanosan who is a full-time employee in the cigarette-producing company Japan Tobacco is above 15 hours per day. That of Ombesan, one of the women earlier engaged as a part-timer by an electronics firm named Shin Shirasuna, 6½ hours plus 6 hours of waged work plus household work. If weekend days when cooking, washing, cleaning and child care continue unabated, be added, the average working week of female labourers in Japan easily reaches 90 hours.

Several lessons, then, may be drawn from our discussions on women's labour in Japan. It is only by calculating the two-fold labouring burden of women that their contribution to creating social wealth can be properly measured. Secondly patriarchal ideology often leads women to disregard the value of their manual work. Thirdly, we also learned from our Japanese experience that the calculation of women's comprehensive labouring time is a crucial element in the

or more per week, millions of women in Japan contribute indispensably to the profits of Japanese multinationals. An initial step towards changing the system is that her work be fully recognised.

GOVERNMENT AND DAY-CARE CENTRES

The Japanese government ever since the 1960s has actively promoted the employment of middle-aged women as a cheap workforce, and its legal policy, under the signboard of 'equal opportunity', has been negatively received by women's groups. More recently, attempts are underway to undermine one of the most significant achievements in the history of the Japanese women's movement. During the 1980s, the government has repeatedly sliced the budget for social welfare, which has notably affected day-care centres.

After the second world war—in particular during the 1950s and 1960s—a movement arose in Japan, demanding the establishment of public nurseries, financed by the state. In some cities, women with crying children on their backs, staged action in front of municipal buildings. Elsewhere mothers hung diapers to dry in the town hall. When possible, negotiations were held with irritated bureaucrats, and where the mayor refused to talk to the protesters, sit-down strikes were held. This movement, under the motto "The day-care centres should number as large as the mailing boxes", forced the government to contribute its share to the operating of day-care centres. The state took responsibility for paying 80 per cent of their costs.

This concrete result was specially important for women working outside the home. It signified that a part of the burden of reproducing labour power was henceforth carried by the state instead of by women. In particular for mothers with small children it meant that their taking jobs outside the home was facilitated. As in other industrialised countries, the Japanese government accepted partial responsibility for reproduction, under the pressure of a movement from below.

In recent years, this achievement of the women's movement is slowly being eroded. On the one hand, military expenses are continuously on the rise while a declining amount of money is available for social welfare and for child care centres in particular. Under its slogan 'payment by the user', the government has twice reduced its contribution to running the centres—from 80 to 70 per cent in 1985, and to 50 per cent in 1986. And although the change presumably is temporary in nature, there are no signs that the downward trend will be reversed.¹³

EXTERNAL EXPANSION AND EXPLOITATION OF WOMEN

Before discussing a possible perspective of struggle, there rests the task of briefly

elaborating on the role of women's labour in the international capital accumulation of Japanese companies. In external expansion Japanese companies make happy use of historically proven concepts. Let us shortly review the case of Shin Shirasuna, a middle-sized electronics company which closed its main premises in Nagoya city eight years ago, to be chased in court by its former part-time women labourers ever since.

The company's base inside Japan, in the years preceding the closure, had steadily contracted. Women who were employed in the satellite factories in the surroundings of Nagoya were laid off first, and ultimately the regular workers and part-timers at the firm's main premises were summarily dismissed too. Meanwhile, Shin Shirasuna had firmly entrenched itself in the Kaohsiung Free Trade Zone in Taiwan. The first factory for the production of radios, with 100 female labourers, started operating in 1964. According to the Japanese investigative writer, Tono Harui, Taiwan Shin Shirasuna, by 1980-81, had grown into the island's second largest enterprise within its own branch. The yearly volume of business then stood at 10 billion yen.¹⁴

At the moment Shin Shirasuna arrived, large-scale unemployment prevailed in the Taiwanese countryside. The excess labour force was one million people. The female workers hired by the company were young village women who had just graduated from high school. They were herded together in fenced dormitories, built by the company or by the Taiwanese government. According to a staff member of the sales' department interviewed by Haruisan, the production costs at Taiwan Shin Shirasuna are only 60 per cent of those in Japan, since female labourers earn only a third to a quarter of their Japanese sisters. Shin Shirasuna is merely one example out of a whole series of Japanese firms which have shifted investments to other Asian countries, and which are constantly on the move, in search of higher profits. And whatever the size, whichever the sector, and whichever the country they move to, Japanese companies invariably prefer to tap young women as a cheap source of labour. Invariably also, they apply those three concepts which have historically been tested by Japan's textile mills: mutual competition between small labour groups, forced savings, and virtual imprisonment in fenced dormitories.

HUNGERSTRIKE OF SOUTH KOREAN WOMEN

Yayori Matsui is an exceptional woman journalist at the daily *Asahi Shimbun*, a newspaper with a circulation of one million, holding office in a modern palace in Tokyo. While we wait for her arrival, we feel quite lost in the gigantic reception hall, where gentlemen in spotless suits walk constantly in and out. Yayori storms into the hall, drags us into the refreshment room, and immediately pours out a welter of militant facts over a cup of coffee. She is full of the

recent events surrounding the arrival of South Korean women workers in Japan:

"A controversy has erupted over three Japanese companies with investments in South Korea. Delegations of Korean women workers are presently visiting Japan to demand justice from all three enterprises, each of which has decided to withdraw from South Korea. The first company is Sumida, an electronics firm which fabricated coils. Last September, the closure of Sumida's factory in South Korea was announced through a simple fax message. The trade union which is pretty strong refused to agree to the decision, and a large number of women initiated a full-scale occupation of the factory. After a period of one month, a delegation of four girls flew to Japan to demand negotiations with the company's directors."

"Initially, the directors of Sumida refused to talk. However, towards the end of December, the four girls went on hunger-strike, announcing 'If you wish to carry away our dead bodies—Go ahead!' The directors then got frightened and ultimately agreed to receive the girls. Only recently, the four have temporarily returned to Korea, to report back."

"The second company, Tanashin Denki, is an enterprise where components for cassette tape recorders are fabricated. Here again—as in the case of Sumida—things are complicated by the fact that the company is a rather small one. The protest of Tanashin's women labourers too is directed against factory closure. A further complication is that the closure has legally been handled well. Seventy women have occupied the factory, and on December 9, they sent their own delegation to Japan to arouse sympathy for their cause. The third delegation consists of women workers of Suani,—a factory where gloves for skiing were manufactured, located in a free trade zone. They have the support of radical trade unions in Osaka and of the Burakumin movement."¹⁵

According to reports of the solidarity committee set up for the Korean women in Tokyo, both Tanashin and Suani, after 10 rounds of negotiations, agreed to apologise for closing down their Korean plants without prior notification. Tanashin also agreed to compensate the workers with a total amount of US \$ 4,40,000. Suani agreed to compensate the women workers with 10 months of their wages, and moreover promised to give financial support to union members until they find new jobs. Both also agreed to send letters to the South Korean government, requesting the release of union leaders arrested during the struggle. The conclusion drawn by Matsuisan from her observations about South Korean women labourers: "If you are really interested in women's labour, you should definitely study the Korean labour movement which is led by women!"

What are the prospects for resistance by women part-timers in Japan? First, very lit-

tle is to be expected from the big trade union federations when it comes to defending the interests of part-time labourers. The organisations target, primarily, males working as regular employees for companies towering high in the Japanese economy. Representatives of various official unions we spoke to were quite outspoken about this. Nor did they hide the fact that their unions 'harmoniously' co-ordinate their strategies with management.

The situation moreover has deteriorated since Sohyo, the trade union centre oriented towards the Socialist Party, forged links of intimate co-operation with the other, more right wing centre, which is tied to the Liberal Democratic Party. The new umbrella organisation called Rengo pursue—according to researchers and activists interviewed—an openly imperialist policy. During the short period of its existence, Rengo has not left any doubt that it wholeheartedly supports Japanese capital's external expansion. In India for instance, Rengo has already conducted a seminar in order to advertise the Japanese model of co-operation between management and labour.

Secondly, the *autonomous* organisation of female part-timers and of other women combining waged with unpaid, household labour, is still in its infancy. Women initially also bore the brunt of the struggle against capitalist exploitation. The first strike erupted in 1886 in a silk-spinning mill. Women, in protest against an extension of the labour-time locked themselves in a temple. The action reportedly sparked off a wave of strikes in textile factories throughout Japan, heralding the awakening of a new class. When however towards the end of the 19th century the organised labour movement arose, it was completely dominated by men. The trade unions, according to the historian Tsusuki Yuko, targeted skilled, male labourers and proposed to exclude women from factory jobs!¹⁶

The history of the Japanese trade union movement has known its own distinct periods of bloom. It has seen tenacious and massive forms of resistance, such as after world war two, when the American occupation authorities temporarily respected the right of workers to organise. In the wake of the defeat of fascism, when Japanese soldiers returned from the war front, the government sought to replace female workers with males. In some companies women fiercely resisted. There were massive strikes, e.g. in the railways, against the government plan to dismiss 80,000 female employees, but these did not result in an autonomous structure.

TOWARDS AN AUTONOMOUS MOVEMENT OF WOMEN PART-TIMERS?

Yet although the history of independent organising is weak, a movement may gradually take shape. The instances of autonomous organising are small, but telling. One of the factors which has con-

initiated towards growing awareness about the unequal, secondary position of female labourers, is a series of court cases which since the middle of the 1960s have been instituted against sexual discrimination in company practices. The court cases challenged for instance, the fact that companies maintain special rules for the dismissal of women, by forcing them to resign at their marriages, etc. Some of the court cases were launched by women individually. A few judges prohibited any discrimination against women, but their verdicts did not durably change company practice. Precedents were created, it is true. And thanks to the mentioned court cases plus accompanying press reports, the unequal treatment was broadly publicised.

Of greater value are those instances where women acted collectively and were represented by their own, autonomous unions. Examples precisely of this kind are the court cases against the dismissals and discrimination by the electronic company Shin Shirasuna referred to above, and the trial recently held against another electronics company, Sanyo Denki, by 15 part-time labourers. Whereas several of these women had worked for 12 years under a subcontractor of Sanyo Denki, they were suddenly dismissed three years back. The court verdict cited on February 26, 1990, by the newspaper *Mainichi Shimbun*, stated "Even though they were part-time employees, the women engaged in the same basic tasks as regular workers. Accordingly, dismissals should have been carried out by the same process as that for regular workers."

What form of organisation of part-time labourers offers most prospects for success? One initiative which appears promising is the Edogawa union. Edogawa is the name of a neighbourhood in Tokyo where many small companies are located—metal workshops, tin factories, workshops for the ironing and packing of garments, etc. The union is not a 'normal' union, for it tries to gather under one and the same roof male and female workers from different factories and workshops located in the same neighbourhood. It explicitly champions, also, the interests of part-time labourers. Grievances which the union, according to spokesperson Obatasan, addresses include discrimination between regular employees and part-timers, in terms of wages, social security, etc. The membership of the Edogawa and other community unions is still rather limited. 30,000 throughout the whole of Japan, Obatasan reports, adding that growth in membership has been steady over the last year. Yet the community union may provide an answer to the circumstance that part-timers are scattered over many, small companies.

In any case, the autonomous organisation of women part-timers should be vigorously stimulated, for they are a crucial ally for women workers elsewhere in Asia who are up against Japanese capital. In order to once more underline the potential, let us lastly cite the example of the combativity of the

women who used to be employed by the food processing company Tsuki Man. Here, female part-timers founded a union to resist the heavy workload which itself resulted from the stiff competition between labour groups. The women also intended to protest against the low wages (only 430 yen per hour). The management's reaction was, first, to dismiss staff members of the union. Women then staged a whole round of strike actions. The confrontation reached a climax when women, through pickets, tried to obstruct the transfer of machinery entrusted to gangsters by the company. Though the removal of the factory could not be prevented, part-time labourers continued resisting. They started boycott of food products of Tsuki Man, and brought the fight against the unjust dismissals to the court. The battle of Japan's new labour 'reserve' is on!

Notes

- 1 A remarkable discussion about the sexual division of labour as it used to exist in the tobacco industry can be found in Edith Abbott, *Employment of Women in Industry: Cigarmaking—Its History and Present Tendencies*, in Baxandall Gordon and Reverby *America's Working Women: A Documentary History—1600 to the Present* (Vintage Books, New York, 1976, p. 87).
- 2 The figure has been derived from the article by Fujita Kuniko 'Women Workers: State Policy and the International Division of Labour: The Case of Silicon Island in Japan' (*The Bulletin of Concerned Asian Scholars*, Volume 20, Number 3, 1988) according to Fujita Kuniko: integrated circuits produced on Kyushu Island constitute 10 per cent of world output in Silicon valley in the United States, 25 per cent is manufactured.
- 3 The water production in Scotland, and the polarisation existing in this section of the electronics industry between highly skilled male personnel and less skilled female workers, has been described well by Swasti Mitter in *Common Fate: Common Bond—Women in the Global Economy* (Pluto Press, London, 1986, p. 83, *The Electronics Industry in Britain and Ireland*).
- 4 This was mentioned amongst others in the report of an international meeting on micro-chips' technology, held in Manila, the Philippines, in 1986. 'From Bonding Wires to Banding Women' (published by the Centre for Women's Resources, Quezon City, 1988, pp. 19 and 27), Mary Hancock in 'Transnational Production and Women Workers' (in *Migrant Women's Labour*, edited by Annie Phizackiea, Routledge, 1983, p. 131) states: "The most common complaint is deteriorating eyesight and frequent headaches caused through the daily use of a microscope for eight hours to carry out the fine assembly work on electronic components", according to her figures, in many of the factories up to 50 per cent of the women assembly workers complain of deteriorating eyesight after

to three years of work.

- 5 According to Gary Saxonhouse, if a comparison be drawn with other textiles' producing centres in the world—with Bombay in India, for instance, and with Lowell in Massachusetts, in the United States—the percentage of female labourers was highest in Japanese textile mills (see the book, edited by Hugh Patrick, *Japanese Industrialisation and its Consequences*, University of California Press, 1976, p. 101).
- 6 Figures about the working hours in the silk and cotton textile mills have been drawn from the article by Tono Harui, 'Japan's Industrialisation and Women Workers' (see *Industrial Women Workers in Asia*, *Women's Journal* jointly distributed by IWS International and the Committee for Asian Women, Rome/Hong Kong, 1985, p. 48).
- 7 A lively description of the working conditions which prevailed in the Japanese textile mills during the early phase of the country's industrialisation may be found in Yasue Aoki Kidd 'Women Workers in the Japanese Cotton Mills 1880-1920' (Cornell University *East Asia Papers*, Number 20, Ithaca, New York). Kidd's story is primarily based on the account of a worker Hosoi Wakizu, who was employed in a cotton spinning mill from 1908 till 1925.
- 8 Sen Katayama, the founding father of the Japanese socialist movement in his book *The Labour Movement in Japan* (Chicago, Charles Kerr, 1918, p. 57) illustrates what gruesome consequences the imprisonment of female factory workers at times had, according to him: 31 young women were roasted alive in the dormitory of one spinning mill when a fire broke out, the women died because the doors and windows of the

dormitory were locked against possible escape attempts).

- 9 For a discussion on the law regarding temporary labourers (called 'arbeiter'), which was introduced by the government in 1986, see 'The Temporary Workers' Employment Act—Two Years after Its Passage'; in the newsletter of the Centre for Asian Women Workers' Fellowship, *Resource Materials on Women's Labour in Japan*, No 3, June 1988, p 3.
- 10 According to Annavajhula JCB ('Japanese Subcontracting Systems' in *Economic and Political Weekly*, February 25, 1989, p M-23) a home worker earns an average of 244 yen per hour, which contrasts sharply with the 1,239 yen per hour which a full-time employee in the manufacturing sector on the average earns; thus, according to this source, the hourly wage of a home worker is merely one-fifth of that of a regular worker.
- 11 See Miyoko Shiozawa and Michiko Hiroki, 'Discrimination against Women Workers in Japan' (*Asian Women Workers Centre*, Tokyo, Japan, 1988, p 19); according to this same source, laws were adopted in 1972 and 1974 specifically to promote the employment of women along the pattern of the M-curve (namely, the 'Women Welfare Act' and the 'Employment Insurance Act')
- 12 The 'Analysis of Labour Economy', an overview published by the Ministry of Labour (July 1989), states: 'Female part-time workers earned about 70 per cent of the amount of earnings for regular female workers in 1987, thus evidencing a fairly wide disparity in wages between the two segments. The sequential disparity in wages has tended to widen since 1975' (p 4)
- 13 See Michiko Hiroki, 'Child Care and Working Mothers' in *Resource Materials on Women's Labour in Japan*, No 3, June 1988, p 11)
- 14 A good description of Shin Shirasuna's expansion policy, and of its consequences for female labourers in Japan and in Taiwan, can be found in the article by Tono Harui, 'Women Workers and the Multinationals: The Shin Shirasuna Case' (*AMPO—Japan-Asia Quarterly Review*, Volume 20, No 4, and Volume 21, No 1)
- 15 For an overview of the social discrimination against Japan's untouchables, the 'Burakumin', see the publication *Japanese Minorities* (Minority Rights' Group, London, 1983, p 4); for details on the hungerstrike of South Korean women workers in Japan (see also the *Asian Women Workers' Newsletter*, Committee of Asian Women, Hong Kong, March 1990).
- 16 Personal interview of Tsusuki Yuko, February 15, 1990; according to Kazuko Tanaka, the early strikes of factory women workers were remarkably successful: 'The strikes in this early stage almost always resulted in a victory for the women workers, because the owners had as yet no strategy to suppress these strikes' (see *A History of the Women's Movement in Modern Japan* (Japan, January 1977, p 23).

FORM IV-A (See Rule 4A (1))

NOTICE

1. It is hereby notified for the information of the public that Greaves Cotton & Company Limited proposes to make an application to Central Government in the Department of Company Affairs, New Delhi, under Sub-section (4) of Section 23 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval to the takeover of Auto Division of Brooke Bond India Limited. Brief particulars of the proposal are as under: i. Name and address of the applicant: Greaves Cotton & Co Ltd., 1, Dr V.B. Gandhi Marg, Bombay-400 023. ii. Name and address of the undertaking the whole or part of which is proposed to be taken over and the manner of acquisition of shares, acquisition of control or management, whether by the acquisition of the ownership of the undertaking or under any mortgage, lease or licence or under any agreement or other arrangement: Auto Division of Brooke Bond India Limited By purchase for cash consideration. iii Management structure of the applicant: The applicant is managed by the Managing Director subject to the superintendence, control and direction of the Board of Directors of the Company. iv a Capital structure of the applicant.

| | |
|---|--------------|
| Authorised Capital (as per Balance Sheet as at 31.5.90) | |
| 25,000 15% Cumulative Redeemable Preference shares of Rs 100 each | 25,00,000 |
| 10,50,000 Equity Shares of Rs 100 each | 10,50,00,000 |
| | 10,75,00,000 |

| | |
|--|--------------|
| Issued, Subscribed & Paid-up Capital | |
| 20,265 15% Cumulative Redeemable Preference Shares of Rs 100 each fully paid | 20,26,500 |
| * 9,85,687 Equity Shares of Rs 100/- each fully paid | 9,85,68,700 |
| * Since split up into shares of Rs 10 each | 10,05,95,200 |

b The undertaking proposed to be taken over Auto Division of Brooke Bond India Limited v Line(s) of business of the undertaking which will or is likely to emerge as a result of the proposed takeover: The manufacture of 2/3 wheelers vi Consideration for the takeover: Rs. 40 lacs. vii Scheme of Finance indicating the source(s) of finance for the proposed takeover: Out of internal generation.

2. Any person interested in the matter may make a representation to Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, Dr Rajendra Prasad Marg, New Delhi, within 14 days from the date of publication of this NOTICE, intimating his views on the proposal and indicating the nature of his interest therein.

Excess Growth of Tertiary Sector

B B Bhattacharya

Arup Mitra

IN response to our paper [Bhattacharya and Mitra, 1990] Nagaraj [1991] questions the empirical justification of the proposition concerning the excess growth of the tertiary sector. He presents some empirical evidence to indicate that the tertiary sector already had a high initial share in net domestic product and in subsequent years has grown slower than the secondary sector. He, however, concedes that during the period 1966-67 to 1976-77 the tertiary sector has grown faster than the secondary sector. But for the period as a whole (1950-51 to 1987-88) and especially in the eighties the tertiary sector has grown slower than the secondary sector. Also he argues that the rate of growth of the percentage share of tertiary sector in NDP has been slower than that of secondary sector

It is important to note in this context that the main thrust of our paper has been on balanced growth between commodity production and tertiary income (henceforth commodity balance) and not on the relative growth of the secondary and tertiary sectors. If the tertiary sector grows much faster than commodity production, then it may result in inflation and/or balance of payment problems. There is, as of now, no definite norm regarding the relative growth rates of income generated in the tertiary sector and the output produced in the commodity sector. However, it is obvious that if the tertiary sector expands rapidly and the gap between the growth rates of the tertiary sector and the commodity sector widens, then it would have adverse implications for inflation and balance of payment. In our paper we have presented evidence to show that the growth of income originating from the tertiary sector has been unrelated to the growth of income from the commodity sector and this has aggravated the inflationary and balance of payments situation in the country in the recent years.

Table 1 presents the growth rates of NDP and value added originating from secondary and tertiary sector. It may be noted that the average annual growth rate of the tertiary sector has always been higher than that of the commodity sector. More importantly, the growth differentials between the two seem to have increased over time and in particular during the eighties when the industrial sector has experienced a spurt. Thus the commodity balance does not seem to have improved even in the eighties.

Even if we confine ourselves to the performance of the secondary *vis-a-vis* the tertiary sector, it may be noted from Nagaraj's [1991] own evidence (Table 2) that the second-

dary sector has grown faster than the tertiary sector only during the first phase of industrialisation: 1950-51 to 1965-66. In the subsequent periods the tertiary sector has been grown faster than the secondary sector. It is quite natural that in the early phases of industrialisation the growth rate of the secondary sector, with a very low initial share in NDP, is likely to register a relatively higher growth rate than the other sectors. Even if we consider his Table 1, we may note that the percentage point increase in the share of the tertiary sector in NDP (13.1) has been higher than that of the secondary sector (11.2) during the period of 1950-51 to 1987-88. Thus in this sense our contention that even for the period as a whole (i.e.,

1950-51 to 1987-88) the tertiary sector has grown relatively faster seems to be justified. However, the rate of growth of the percentage share of the tertiary sector in NDP could be lower than that of the secondary sector as shown by Nagaraj [1991]. But the growth rates of the sectoral shares are not the proper measure of sectoral performance.

The central thesis of our paper was that the tertiary sector in India has been growing much in excess of the demand generated for services by the commodity sector. In our paper we have substantiated this point in terms of the income linkages. However, it may be argued [Edgren, 1990] that although tertiary sector income is not directly related to commodity sector income, the latter, especially manufacturing output, may generate employment in services through its multiplier effect (e.g., servicing, transporting and marketing of manufactured products). The manufacturing sector may therefore

TABLE 1. SECTORAL GROWTH RATES OF NDP, 1950-51 TO 1987-88

(Percent per annum)

| Period | NDP | Commodity Sector | Tertiary Sector | GRD |
|--------------------|-----|------------------|-----------------|-----|
| 1950-51 to 1965-66 | 3.6 | 3.4 | 4.2 | 0.8 |
| 1966-67 to 1975-76 | 3.3 | 3.0 | 4.1 | 1.1 |
| 1976-77 to 1987-88 | 4.1 | 3.4 | 5.4 | 1.0 |
| 1980-81 to 1987-88 | 4.7 | 3.8 | 6.2 | 2.4 |
| 1950-51 to 1987-88 | 3.5 | 2.9 | 4.6 | 1.7 |

Notes: (1) GRD is tertiary sector growth rate minus commodity sector growth rate.
(2) Commodity sector is defined as the sum of primary and secondary sectors. In our earlier paper [Bhattacharya and Mitra, 1990] the commodity sector was defined as sum of agriculture, forestry, and manufacturing sectors only. In this note we have made the definition consistent with the sectoral classification used by Nagaraj [1990].
(3) Figures in the table refer to exponential growth rates.

TABLE 2. RELATIONSHIP BETWEEN TERTIARY SECTOR EMPLOYMENT AND INCOME IN TERTIARY AND COMMODITY SECTORS AT THE STATE LEVEL

| Year | Intercept | lnMFGI | lnTERI | lnAGI | R ² |
|------------------------------|---------------------|--------------------|--------------------|------------------|----------------|
| 1983 (15 obs) | -8.012 (-3.159)* | -0.112 (-0.439) | 1.091 (3.049)* | | .82 |
| 1987-88 (15 obs) | -5.949 (-2.401)* | 0.119 (-0.472) | 0.978 (2.831)* | | .78 |
| 1983 and 1987-88 (30 obs) | -7.333 (-4.350)* | -0.135 (-0.778) | 1.074 (4.518)* | | .80 |
| 1983 (15 obs) | -9.956 (-3.747)* | -0.008 (-0.032) | 0.772 (1.991)** | 0.335 (1.635) | .86 |
| 1987-88 (15 obs) | -7.785 (-2.570)* | -0.110 (-0.437) | 0.884 (2.487)* | 0.197 (1.045) | .80 |
| 1983 and 1987-88 (30 obs) | -9.185 (-4.743)* | -0.101 (-0.604) | 0.925 (3.786)* | 0.230 (1.757) | .82 |

The general functional form is:

$$\ln \text{TEREMP} = \alpha + \beta \ln \text{MFGI} + \gamma \ln \text{TERI} \text{ (and } + \delta \ln \text{AGI)}$$

where TEREMP - Tertiary sector employment,

MFGI - Manufacturing sector income at 1970-71 price,

TERI - Tertiary sector income at 1970-71 price,

AGI - Agriculture sector income at 1970-71 price,

ln - Natural log,

* and ** - denote significance at 5 and 10 per cent levels respectively.

Sources: (1) Central Statistical Organisation, *Estimates of State Domestic Product*, 1989.

(2) National Sample Survey, 38th and 43rd Rounds.

contributes to income of services through employment generation. There was an acceleration in the growth of manufacturing output in the 80s. It is therefore worth examining the impact of this on employment in services. But an empirical investigation of this hypothesis can be done only at the cross-section level because time-series data on employment covers only the organised sector of the economy. The information on employment (principal category) from the National Sample Survey, 38th Round for 1983 and 43rd Round for 1987-88, are utilised for this purpose. The corresponding data on State Domestic Product are taken from the Central Statistical Organisation. The regression results (Table 2) however do not support the hypothesis mentioned above. Given tertiary sector income the partial elasticity of tertiary employment with respect to manufacturing (and also agricultural) sector income turns out to be statistically insignificant. It may be noted that the data on tertiary sector employment here includes that in public administration which is generally not influenced by multiplier linkages. However since data on employment in NSS 43rd Round does not

give separate information on employment in public administration we could not separate it out from the total tertiary sector employment. Despite this limitation we may broadly infer that not only income but also employment in services appear to be growing independent of the commodity sector growth.

To conclude, neither income nor employment in services was significantly influenced by commodity sector income, especially manufacturing income even in the high growth phases of the eighties. It is in this perspective that the excess growth of the tertiary sector and its implications for inflation and balance of payment deserve attention of the policy-makers.

plainly ignores her identity as an active, functional and necessary member of an extended family and a complex rural community. Pumping money may effect some immediate changes which even the traditional village heads would accept as they can very well see which side of their bread is buttered. But it remains to be seen how far the changes would persist and to what extent they are only plastic surgery.

In conclusion, I feel it should be pointed out that this article only proves that bilateral funding also goes the way of most traditional development efforts—to make the rich even better off while leaving the poorer sections barely touched. This is evident from the repeated mention of improvement in the conditions of "women from somewhat better off households". Further, as the author herself admits in regard to irrigation projects, "...any traditional agricultural employment generated by the irrigation facilities can be an important contribution to get more labour but it can also give more resources to landholding patriarchy to have more power in imposing control over the labour of landless women". And development experience indicates that the latter is what normally happens.

I am surprised that *EPW* should have devoted so much space to prove that bilateral funding can effect any kind of empowerment of the downtrodden or the oppressed. Empowerment of women, or any underprivileged group for that matter, can be realised only through a people's movement. If planners and policy-makers want any part in it they should think along the lines of generating employment to create assets that can be controlled by women, or help them assert control over existing resources through selection of appropriate projects. Rather than working with the individual it would be better if they adopted a community approach as empowerment can be realised much more effectively by a group rather than by the individual.

Bilateral Funding and Women's Empowerment

Vidhya Das

THE article 'Empowerment of Women: Its Scope in a Bilateral Development Project' by Loes Schenk Sandbergen (*EPW*, Review of Women Studies, April 27) seems to be more indicative of the extravagant dissipation of resources in bilateral aiding rather than of any real change in the social status of women in a rural community.

The government of India norm for installation of hand-pumps is one for every 250 population. If individual family units can be given a hand-pump just on the whim of a bilateral aid project, where is the replicability? And again the article indicates that there was a marked improvement in production from zero to some (the quantity is not indicated) but fails to establish how it improves the social position of the women within the family or within the community—the "strategic gender needs", as the study terms it. There has been a tendency to compartmentalise the so-called practical gender needs and the strategic gender needs, whereas a deeper insight into the changing family situation would have given a better picture of the definite linkages between the two.

The study emphasises improved production of vegetable a lot, but gives no indication of a cost-benefit analysis. The price of hand-pump installation is high, but the only indication of the quantum of economic returns is "a small quantity of vegetables" and, more specifically, a small quantity of coriander leaves. There is no analysis of how much the family consumes, how the money

is utilised and how the production was undertaken. There just seems to be an assumption that since the hand-pumps are in the names of the women members of the households, they would be having all the controls. In the case of site selection for hand-pumps, which was apparently done as per the women's preference, there is no effort to see whether their opinion was influenced and to what extent.

I regret to say that this article smacks of the typical elitist feminist view which gives prime importance to the woman as an isolated individual unit and almost com-

Lopsided Growth

Political Economy of Indian Development

by Pradhan H Prasad

This collection of essays in political economy unravels the forces which have acted as a drag on Indian development. The Achilles' heel of Indian development plans, the author argues, has been their preoccupation with investment planning to the neglect of institutional transformation. Within this broad framework the author discusses a wide range of subjects including macro-economic plan models, choice of techniques, the persistence of outmoded production relations in agriculture, growing political assertion by the middle peasantry, roots of agrarian violence and uneven regional growth.

Different Focus

The preoccupation with Salman Rushdie's portrayal of 'the Nation' and 'the Third World' on the one hand and with the digressive self-reflexivity ('Indian-ness') of his narrative technique on the other has resulted in the obscuring of his ideological moorings in the High Culture of the modern metropolitan bourgeoisie and in the suppression of a whole range of questions which have little to do with either 'the Nation' or 'the Third World' but which nevertheless are central to the basic import of Rushdie's narratives

1461

Road to Serfdom

We do need to liberate the Indian economy from the shackles of bureaucratic control, but trade reform of the type recommended by the World Bank is certainly not the first step in that direction

1437

Spring-Cleaning?

The main tactical task on the morrow of the Lok Sabha elections should be to isolate the BJP and its sympathisers and to mobilise the bourgeois democratic elements on a wide platform ideologically motivated by the Left

1443

Rajiv Gandhi's assassination should have provided the occasion for a general political spring cleaning. Unfortunately, it has not, at least not till now and there are few signs that unless pushed by circumstances, overall political behaviour in the country will undergo any qualitative transformation in the near future

1435

The self congratulation in Assam over the peaceful conduct of the polls may not be unjustified, but it is more important to note the ULFA's role in keeping the elections peaceful and the calculations underlying it

1443

Under Pressure

In the post Gulf War international balance with a vastly enhanced role for the US, the Third World will be confronted by the clovelly concerted pressures of the US and Europe in the political, economic and military spheres with no countervailing force anywhere in sight

1449

Lost Gilt

The government's decision to pledge 20 tonnes of confiscated gold abroad, which has attracted widespread criticism, is but a symptom of the country's external economic crisis which calls for review and reversal of the policy of economic liberalisation

1444

Opaque

Currently available data on khadi and village industries are inadequate and fail to provide an accurate profile of these industries. Suggestions for improvement

1452

Forgettable Anniversary

Within two years of the Tiananmen Square incidents, the whole episode looks so frightfully dated. Nobody is interested in it any more. The investors are not. The West is not. Japan has been more than keen to resume its role in China which it was forced, under American pressure, to suspend for a while

1441

Evidence Ignored

Those who argue for a money-based monetary policy, especially in approaching the problem of inflation, tend to evade the concrete evidence on the interest sensitivity of demand for money and the role of money supply in the inflationary process

1472

Women in Ancient India

THIS refers to Sukumari Bhattacharji's 'Economic Rights of Ancient Indian Women' (March 2-9). Her otherwise trenchant presentation is vitiated by a startling inaccuracy on page 511, column 2, paragraph 3. She writes: "Devayani was part of Sharmishtha's dowry; but Yayati who married Sharmishtha enjoyed Devayani slyly and begot Anu, Puru and Druhyu in her." This is unauthentic. The *Mahabharata* states precisely the converse in section 75, verses 34-35, section 81, verse 37, section 82, verse 25, section 83, verses 9-10 of the Sambhava Parva of the Adi Parva. According to these, Devayani forces Yayati to marry her, and takes Sharmishtha along with her as dowry. Devayani has Yadu and Turvasu as sons, while Sharmishtha solicits Yayati in secret, persuades him that it is his duty to satisfy her desire for children, and begets Druhyu, Anu and Puru thereby. It is not Yayati who approaches Sharmishtha but the other way about. Sharmishtha slyly enjoys Yayati.

Bhattacharji also misrepresents the story of Madhavi on the same page. Yayati, not having 800 horses with one ear black each as demanded by Vishvamitra of Galava as 'guru-dakshina', gives him his daughter instead, since by giving her in marriage to a king, Galava can obtain these horses. Unfortunately, Haryasva, to whom Galava goes first, has only 200 horses. That is when Malati herself, noticing the despair of Galava, tells him that she possesses a boon whereby she regains virginity even after giving birth to a child. It is Madhavi who suggests to Galava that he should give her to four kings desiring sons, and thus obtain 800 horses. Thereby, Haryasva, Divodasa and Usinara, each gets a son and Galava gets 600 horses. To make up for the missing 200, he gifts Madhavi herself to Vishvamitra, who begets Ashtaka, the rajarshi. It is this Ashtaka who saves his maternal grandfather Yayati from falling into the earthly hell when he is thrust out of heaven. The 'usage' aspect, therefore, is a direct consequence of Madhavi's own suggestion for rescuing Galava, and is *not imposed* on her, for she could well have remained with the first king, Haryasva, by keeping the secret of her boon safe.

Actually, even prior to the pledging of Draupadi in the dice-game, the use of the woman as an object is first made by Kunti herself, the mother-in-law. While Arjuna and Bhima hold the incensed kings at bay in the bridegroom-choice arena, Yudhishtira and the twins scurry home. Thus, Kunti knows all about what has happened when Bhima and Arjuna come home with Draupadi. Kunti calmly asks the five brothers to divide the princess among them equally, and then gets extremely anxious that her word should not become false. Vyasa puts on a command performance with mythical tales in order to persuade Drupada to agree to the polyandrous union, with both Kunti and Yudhishtira insisting that the

mother's command, once stated, must not become false! Similarly, Pandu directs Kunti which god she must sleep with on all three occasions for getting him foster-children. Like Madhavi, she announces the boon she possesses and does not mind being used as a child-producing machine. We have, therefore, to see the psychological make-up of the women themselves whereby they volunteer for such exploitation. Obviously, some sort of self-fulfilment is involved in the transaction and it cannot be treated simplistically as another instance of MCP-ism, particularly in Sharmishtha weaving her net of enchantment around Yayati who has scrupulously been avoiding her.

Calcutta

PRADIP BHATTACHARYA

Environmental Colonialism

THIS has reference to your editorial 'Global Warming: Environmental Colonialism' (February 23). The Centre for Science and Environment (CSE) study has challenged the findings of the WRI report on global warming which puts the blame on developing countries for the occurrence of global warming. By using the data from the WRI Report *World Resources 1990-91*, the CSE study examines the validity of arguments and myths put forward by this study that India, China and Brazil are amongst the top five countries responsible for the global warming.

This is not the only study carried out by WRI which blames the developing countries for environmental destruction in the world. In fact, a few years ago, the WRI published a report for the World Bank and UNDP, *Tropical Forests: A Call for Action*. This study also put the blame on poor people, not profits, for tropical deforestation and called for commercial forestry based on privatisation to solve the problems of deforestation and poor. These arguments were used by the

Britishers to colonise our forest resources and now, through 'scientific', 'objective' studies, these arguments are being presented to us once again.

It is high time that such studies by WRI and other similar institutes in the West are examined and exposed by research institutes, NGOs and citizen groups in Third World countries. To counter the Western hegemony, we need to have more data base and scientific institutions to look into the environmental and developmental issues, both global and local.

Instead of seriously examining the issues of equity between developed and developing countries raised in the CSE study, Allen L Hammond of WRI (*Indian Express*, January 28) argues that such issues should only be discussed and negotiated in the context of a global climate convention and the United Nations Conference on Environment and Development to be held in 1992. Here again, there is a serious danger of over-representation of environmental groups and institutes like WRI from the industrialised countries and marginalisation of popular environmental movements and groups (such as the Ganga Mukti Andolan and those involved in the Baliapal struggle in India) from the Third World countries. There is a growing concern and consciousness in the Third World countries about the need to stop the construction of environmentally destructive developmental projects like big dams, nuclear mining projects, tourism, etc. But the voices and views of environmental movements and groups who are involved in such struggles will not be heard if mere tokenism prevails. Therefore, it is the responsibility of environmental groups and movements from the Third World countries to come together, build solidarity and alliances with like-minded groups from developed countries so that real issues related to environment and development can be discussed and debated in the conference.

Old Myths

ONE wonders what the CPI(M) hopes to gain by running with the hares and hunting with the hounds. The series of ambivalent statements made by its different leaders in the wake of Rajiv Gandhi's assassination definitely show up the party in poor light. The assassination seems to have sent the leaders scurrying in different directions. Utterances made by one leader need to be clarified by another the next day while some other day another leader says something utterly different.

What, for instance, is one to make of Jyoti Basu's reaction to Rajiv Gandhi's assassination as telecast on Doordarshan the next day? Basu was quoted as saying that the event struck a blow at the nation's stability. So, are we to understand that Rajiv Gandhi symbolised stability? This exactly is the claim which was being made by his party in the election campaign. Yet all these months the CPI(M) was telling us that it was Rajiv Gandhi who had destabilised the country by his policies. Now, after Rajiv Gandhi's shocking death, has a veteran leader like Jyoti Basu been swept off his feet and stampeded into joining the chorus about loss of stability as orchestrated by the Congress(I)? Even more intriguing have been the doings of another CPI(M) leader, Harkishen Singh Surjeet. At a time when the Congress(I) was in the throes of a crisis over the choice of its leader, Surjeet arrived on the scene to reassure the nation, at a press conference in Delhi on May 27, that there was no crisis in the Congress over the election of a new party president. Was it really necessary for this eminent CPI(M) leader to become a spokesman of the Congress(I)?

Soon after the election of P V Narasimha Rao as the Congress(I) president, the CPI(M) general secretary E M S Namboodiripad addressed a letter to him, which was almost grovelling in its appeal to the Congress(I) to re-examine its attitude towards the Left parties before the polls took place in the remaining Lok Sabha and assembly constituencies, while complaining about Congress(I) attacks on his party cadres in West Bengal, Tripura and Kerala. Namboodiripad expressed the hope that Narasimha Rao would complete the process of restoring inner party democracy in the Congress(I). One fails to understand why a professedly self-reliant and independent party has to depend on changes in the Congress(I) organisation and to seek its favours. Following reports of confusion among the party ranks and speculation in the national press, a spokesman of the CPI(M) sought to allay misgivings by issuing a statement on June 1 saying that there was no question of the CPI(M) joining hands with the Congress in any post-election scenario. Jyoti Basu, talking to reporters at the Calcutta airport before leaving for a holiday at Digha, also hastened to reiterate that there was no question of any realignment of political forces in the post-poll scenario.

But these clarifications notwithstanding, the CPI(M) leaders need to do a lot of explaining. It is not without reason that E M S Namboodiripad, Jyoti Basu and Harkishen Singh Surjeet, among the party's politburo members, have somehow managed to acquire the reputation of nursing a soft spot for the Congress(I) in general, and certain people in that party in particular. Jyoti Basu, for instance, had established a personal rapport with Rajiv Gandhi in recent years and had succeeded in neutralising him during the elec-

tion campaign in West Bengal, much to the chagrin of the State's Congress(I) leaders and cadres. The latter quite openly expressed their resentment at the conspicuous absence of any anti-Basu tirade in Rajiv Gandhi's speeches at election rallies in the State. Jyoti Basu for his part is on record as having said that in the event of a hung parliament, his party would support any government at the Centre on an issue-to-issue basis. Was this an indirect way of reassuring the Congress(I)? As for Surjeet, his party's bleak prospects in the Punjab elections seem to have brought him closer to the Congress(I), whose support he needs to get the polls in that State postponed. Namboodiripad's pro-Congress(I) stance, however, appears to be contrary to the stand taken by chief minister E K Nayanar in Kerala. Soon after Namboodiripad's appeal, Nayanar at an election rally in Kochi, lambasted the Congress(I) leadership and roundly blamed it for Rajiv Gandhi's assassination. It seems, therefore, that Namboodiripad's views are dictated more by his concern for the post-poll national scenario than by the immediate local electoral interests of his party in Kerala.

What apparently brings together these leaders is the plea that the BJP-VHP combine and the secessionist forces in Punjab and Kashmir must be fought by allying with all secular forces, including the Congress(I). This view is, it seems, shared by sections of the CPI as evident from the 'open letter to Congressmen' addressed by the CPI MP, Chaturanan Mishra, on June 1, in which he calls for a "national consensus among secular parties" in the situation brought about by Rajiv Gandhi's assassination which is described as 'not just the assassination of the president of a party but a national tragedy'. Mishra's desire to identify Rajiv Gandhi with the Indian nation is just a step ahead of Jyoti Basu's identification of Rajiv Gandhi with stability. Not to be left behind, the CPI leader requests secular parties like the Congress(I) to abjure alliances with communal and divisive parties either in government or in the opposition.

While the concern expressed by the CPI(M) and the CPI about the rise of communal and divisive forces will be widely shared, it is rather intriguing that they should appeal to a party which during its rule at the Centre, and in several States, for most of the post-independence era, had fostered the rise of the same communal and divisive forces which the Left is trying to fight. How can the CPI(M) forget that it was Rajiv Gandhi who inaugurated his election campaign in 1989 by taking the name of Rama at Ayodhya? How can it forget that it was Indira Gandhi's Congress which propelled Bhindranwale to serve its interests in Punjab leading eventually to the present imbroglio there? How can it ignore the communal riots that have taken place in States ruled by the Congress(I), or the direct involvement of Congress(I) leaders in the massacre of Sikhs in Delhi and other places in October-November 1984? Those leaders are still around and are dictating the policies of the Congress(I), to which the CPI(M) and CPI are making appeals for an alliance of secular forces. Can such an organisation by any stretch of the imagination be described as secular? How much longer will it take the Indian communists to purge themselves of the myth that the Nehru dynasty and the Congress Party can be the only bulwarks of stability and secularism in India?

URBAN MESS Victims of Neglect

THE deluge which hit Bombay city last week and disrupted city life for several days is not only a cause for concern to the city administrators and citizens, but is a worrying comment on the neglect of urban planning in general. There is no denying that the volume of rainfall in those two days, "the worst ever since 1952", would have put a strain on the most efficient of water carriage systems—the heavy downpour combining as it did spectacularly with high tide in Bombay's big drain, the Arabian sea. But equally, the drainage system, designed almost a century ago, has long been showing signs of breaking down. The storm water drains reportedly criss cross with the city's drainage system and in times of stress, as when there is an excess of water the two systems tend to break down together, making the process of water drainage almost impossible.

Long ago a report had recommended desilting of the drains as an urgent measure but nothing much seems to have been done on this count. Neither the drainage system nor the storm water system is adequate for the demands of the city, even without the 'mix' which is bound to take place during the monsoons—the latter apparently is capable of taking care of about an inch of rain a day, but in the last many years Bombay has been receiving as much as two inches a day on many days (and in a 24-hour period last week as much as over 3 inches). Clearly, while there has been much discussion about these issues, no long-term measures have been implemented in a long while to alter, redesign and expand the water and drainage systems (not to mention the water supply system which is quite another agonising concern). In short, little cognisance has been taken of the expanding city and its needs. And if this is the situation in Bombay, which is generally thought to be the best administered as far as civic amenities are concerned, is there any reason to believe that other cities are better maintained?

On the contrary, the general neglect of urban planning over the decades has led to a proliferation of urban problems. For example, among the reasons for the flooding in Bombay in areas which had never before been so affected were the uncollected garbage and the debris from unfinished road work which obstructed the flow of water. The Bombay Municipal Corporation employs perhaps the largest number of workers for garbage disposal

and has adopted some modern methods of disposal, such as compacting, etc. These are, however, becoming increasingly inadequate. And sadly this is the case in most urban areas, including the proliferating small towns.

This unconcern for all-round planning has also meant a neglect of the possible consequences of new development. For instance, in Bombay, reclamation of land from the sea has been taking place at an increasing pace both at the southern tip as well as further north on the city's western side. But there is no indication that these projects had ever given thought to how the land fill would affect the tide patterns on the city's shores and, consequently, how it would affect the city's drainage systems during the monsoons.

As usual, the worst affected in last week's deluge were the slum- and pavement-dwellers who comprise most of the one lakh people rendered homeless. While the middle class wet its feet, the working class populations nearly got drowned or lost most of their meagre belongings and shelter, such as it was. And this is what happens every year. Since these sections have been relegated to the status of 'illegal' occupants by the city administration, their loss is never estimated nor, of course, compensated. And yet their ranks are swelling not only in the large cities but in the smaller ones as well.

ELECTIONS

Biased High-handedness

PRESIDENT R Venkataraman's recent exhortations to the nation over the radio and TV networks to ensure 'free and fair' elections may have been well intentioned, but they lacked effective appeal because of some other contradictory signals from New Delhi about the same time. These signals came from the chief election commissioner (CEC) whose conduct is the most crucial in determining the degree of freedom and fairness of the electoral exercise.

One refers to the CEC's latest decisions regarding the two States of West Bengal and Tripura. In the first State he has ordered repolling in 40 booths, merely on the basis of some complaints made by the Congress(I) candidates, while in the second State he has refused to postpone the polls despite repeated complaints by the Left Front about widespread Congress violence against the opposition parties—complaints which were substantially supported by the contentions of 10 IAS officers of the State.

The blatancy of the CEC's protection

to the Congress(I) violence in Tripura has not escaped the notice and comments of quarters which can be least suspected of harbouring any pro-Left bias. Thus, the Agartala correspondent of *The Telegraph* referred more than once in his report datelined June 8 to the Congress(I) violence against the Left Front in the wake of Rajiv Gandhi's assassination. *The Statesman*, Calcutta, even devoted a leaderette titled 'Blind Man's View' in its issue of June 9 indicting the CEC for "allowing Congress(I) hoodlums in the State [Tripura] to get away scot-free".

Contrast to this the CEC's fiat to the West Bengal government to hold repolls in 34 polling stations of the Howrah parliamentary constituency and six polling stations of the Asansol parliamentary constituency—15 days after the first polls and even though there was no report of any irregularity from the returning officers concerned, indeed even after the returning officers concerned had replied to his queries that there had been no incident of booth capturing in any of these constituencies.

Against this background, the president's exhortations for free and fair polls gets further compromised as the CEC makes it a point to publicise his frequent meetings with the former while pursuing his apparently unfair policies.

SOVIET UNION AND G 7

Unreal Expectations

ONE thing is now certain. Mikhail Gorbachev is going to London to address the G 7 summit on July 17, the day the summit concludes its regular business. The British, the hosts this time, emphasise that Gorbachev is not to participate in the summit meeting, he is only to address the summit participants after the regular meeting.

Gorbachev has made no bones about why he is so very keen on going to the G-7 summit. His purpose is to plead for support for his economic reform programme. And the support he seeks is not small; the sum mentioned is \$ 150 billion over the next five-year period. An advance team headed by Yevgeny Primakov, the man Gorbachev deputed to put some sense into Saddam Hussein on the eve of the Allied ground attack against Iraq, was in Washington to explain Gorbachev's reform programme.

Significantly, while George Bush keeps on promising support to Gorbachev personally and to his perestroika—"I want perestroika to succeed"—are George Bush's

exact words—soon after Primakov's Washington visit, the US secretary of state, James Baker, in his address to NATO foreign ministers rejected outright notions of massive Western aid to the Soviet Union when he said, "I don't honestly think we can catalyse Soviet reform through a big-bang approach" At the same time, though, Baker was setting conditions for whatever support might be forthcoming from the West His four conditions were that the Soviet Union must make a clear move "to embrace a real market economy", stop repressing the "independence-minded" Baltic States, cut military spending and end aid to "regimes that pursue internal repression" Baker made it clear subsequently that he had Cuba in mind when he referred to regimes practising internal repression Evidently, however much the US is inclined to be supportive towards Gorbachev and his reforms, it does not envisage pledging of hundreds of billions of dollars

Of course, the US itself is in no position to pledge the large sums Gorbachev is aiming at and Gorbachev should know this The US has been, and continues to be, an importer of enormous amounts of foreign capital Even today it is running a current account payments deficit of \$ 100 billion The US economy is being sustained by massive inflows of funds from Japan Germany and other countries, with no mean contributions coming from countries like South Korea and Taiwan So, if substantial pledges have to be made to the Soviet Union, it could adversely affect the flow of funds not only to East Europe and the Third World, but also to the US Of course, if one posits a reversal of the current recessionary trends in the West and projects a scenario of reasonable growth, say, at 3 per cent per annum, as against the present level of less than 2 per cent, accommodating an export surplus of \$ 30 billion with the Soviet Union should not be difficult But then there has to be thinking at a very different level one that transcends the immediate interest of each of the countries concerned Gorbachev is possibly counting on that but isn't he day-dreaming?

BALANCE OF PAYMENTS

All-Too-Brief Respite

It is, of course, very disturbing that the country is being driven to dip into its gold holding The decision of the government to raise, through the State Bank of India, a loan of \$ 200 million on the strength of a swap arrangement involving 20 tonnes of gold out of the confiscated stock with the government may well be the begin-

ning. After all, with as much as \$ 4 billion of revolving debt and with foreign exchange reserves having receded below the \$ 1 billion mark, it was a matter of weeks, if not days, before some such a step had to be resorted to

The hue and cry being raised in certain quarters about the inadvisability of the present government resorting to the gold swap is totally unjustified Precisely because the present government is a caretaker government, it has gone in for a swap and not an outright sale This gives any successor administration the opportunity to rescind the swap if it can work out some other arrangement for raising the required funds Indeed, the successor administration, whatever its hue, will have to think on those lines for the simple reason that the country's gold reserves, including the stock of confiscated gold, do not add up to much At the prevailing international price of gold, its value will work out to around \$ 4 billion, at the outside There is also an added reason Precisely because it is a swap arrangement and not an outright sale, the amount realised seems to be 25 per cent less than what could have been realised from outright sale at the current international price of gold

Of course, the very first task of the new administration will have to be to sort out the arrangements for tackling the country's critical payments position The stop gap arrangement made by the present caretaker government may well give the new administration some breathing space and for that it should be thankful, but the respite will not last very long

DEFENCE

For US Eyes Only?

STRANGE are the ways of our defence establishment It withholds even the most innocuous information from the public on grounds of 'national security' Yet it bends over backwards to treat the US ambassador to a tour of the most sensitive spot in our border area on the plea of 'courtesy'

The trip was organised from June 6 to 8 The spot was Siachen in Kashmir where the Indian army remains entrenched facing Pakistani troops It is supposed to be out of bounds for ordinary Indian citizens, not to speak of foreigners Such is the concern over security in border areas that whenever Indian press persons are taken there by the army authorities on conducted tours, they are required to refrain from mentioning in the dateline the name of the spot and use the

euphemism 'somewhere in the border area' so that the 'enemy countries' do not get to know from their reports about the details of our defences But the US ambassador is, of course, from a 'friendly country' and, therefore, can be allowed access to secrets which an ordinary Indian cannot be trusted with

The entire trip appeared to be a hush-hush affair The ambassador arrived at Nimu, the divisional headquarters of the troops posted in Siachen, and was reported to have had a tete a tete with the local army authorities there who had earlier organised his transport from Leh When the news leaked out, officials in New Delhi hemmed and hawed at first The external affairs ministry, which is required to be kept informed of the movements of foreign dignitaries, pleaded ignorance Army sources initially feigned ignorance, but later confirmed the report, describing it as a mere 'courtesy call' to a military camp

One wonders what the army is up to in Kashmir? Are the local army officers acting on their own? Is there a communication gap between the headquarters and the officers posted in Kashmir? Last year, the army got itself in a tight corner over the kidnapping of a journalist in Srinagar He was taken away from his home by army jawans Army bosses in Delhi at first disclaimed any responsibility for his arrest, and some even suggested that he might have been kidnapped by terrorists in the garb of Indian jawans' Only when the matter was taken to the Supreme Court was the journalist released from army custody

The Indian public has the right to know whether the US ambassador's tour of Siachen was in response to an invitation by the local army commanders, or whether it was cleared by the army headquarters If it is the first, it requires suitable action against army personnel who acted 'presumably without any clearance from the top But if it is the second, it involves far reaching political implications Is New Delhi tilting towards Washington to the extent of opening up its defence structure to US supervision? Is it a prelude to its willingness to submit to the requirements of the Pressler Law under which it will have to obtain the US president's certificate regarding its nuclear plans? In the past the Indian government tended to raise the pitch of its anti US rhetoric, particularly on the eve of any major policy decision that ultimately led to submission to US pressures Today also, it may not be a coincidence that while some members of the Union cabinet keep on thundering against the CIA and blaming it for Rajiv Gandhi's assassination,

...colleagues in the same cabinet surreptitiously welcome the US ambassador to an inspection of the country's defence preparations along a sensitive border

ETHIOPIA

Danger from US Involvement

THE 30 year civil war in Ethiopia which has left about 2,00,000 people dead in the fighting, caused recurring famines that have taken a toll of 3,00,000 people and rendered some 15 million people refugees has finally seemingly concluded. But Ethiopia's predicament has eased only to the extent that one of the two primary antagonists has ceased to exist and in the circumstances that obtain excessive optimism of a quick and surgical solution to the country's problem may be misplaced.

True, the three main rebel groups—the Tigrean dominated Ethiopian Peoples Revolutionary Democratic Front (EPRDF), the Eritrean Peoples Liberation Front (EPLF) and the Oromo Liberation Front (OLF)—had united in ousting the regime of Mengistu Haile Mariam. Now that this objective has been achieved, difficulties are liable to crop up. Under the terms of the US mediated London agreement the EPRDF is to exercise power in Addis Ababa as an interim government pending an all party conference to be convened before July 1 which will discuss the formation of a broad based provisional Ethiopian administration which in turn will conduct election.

However, the EPLF says that while it will co operate in the formation of the provisional government it will not participate in it. Instead the EPLF which wants independence for the Eritrean region has announced that it will form a provisional government in Eritrea pending a referendum under UN supervision. According to EPLF leader Issaias Alwerki, the formation of the provisional government would be merely formalising the government and administration of the past 30 years implying *de facto* Eritrean control all through the past. If Eritrea proceeds with the demand for full independence the rest of Ethiopia will be land locked since the province on the Red Sea controls the entire Ethiopian seaboard with its ports of Massawa and Assab.

This problem is however not as intractable as it seems. As of now the EPRDF leader Meles Zenawi has refrained from anything more severe than a mere expression of hope that Ethiopia will remain united and has made it clear that the 'freely expressed will of the people' would be accepted. This is a salutary recognition

of the futility of holding the country together by force, which itself is an implicit recognition of Eritrean military power and the mass support that the EPLF and the idea of independence enjoy in Eritrea. For its part, the EPLF too has so far struck a note of moderation. It has announced that the formation of the provisional government is not to be construed as a declaration of independence and that the referendum—which offers a choice between independence and autonomy—may be deferred till after the general elections which is likely to be delayed by more than a year due to the absence of reliable voting registers. Given these fraternal concessions and the fact of a shared political ideology, a peaceful solution to the seaboard question may well be worked out. But at the level of mass nationalism the Eritrean desire for independence is as strong as the opposition to it by the dominant Amhara population of Ethiopia. Consequently, the possibility of events taking a course that is at variance with the leadership's current flexibility cannot be ruled out.

The more fundamental problem is external. The chief architect of the new world order' has taken an excessive interest in Ethiopia's internal affairs. The West can take little solace from the ouster of Mengistu's supposedly Marxist regime since the struggle in Ethiopia has been exclusively confined to groups professing Marxism Leninism and the communist aims of all three rebel groups sit uncomfortably with the 'spirit' of the new world order. Mischief cannot therefore be precluded and there is more than a suspicion of it in the US mediator's attempt to portray the seizure of Addis Ababa as having been accomplished at American bidding, as also in the gratuitously indulgent advice to refrain from reprisals and to move quickly towards democracy. The US assistant secretary of state for African affairs Herman Cohen has been crudely categorical in asserting that Ethiopia will get international support only if it lays the groundwork for a new political system. Since the EPRDF had already made clear its intention of moving towards a multi-party system, the harping on the so called new political system seems to imply a repudiation of the political ideology of the rebels. But given that the mass support of the rebels in many areas is founded on various reform measures consistent with their ideology, such a repudiation may not be easily forthcoming. Hence aid to Ethiopia, particularly under famine conditions, might be linked to the extraction of such a repudiation, the consequences of which, though it cannot be gauged now, may well be a continuation of civil strife.

TWENTY YEARS AGO

EPW, June 12, 1971

In the midst of the thousands of refugees pouring into India everyday, it may not be exactly comforting to know of "the coincidence of points of view of India and the Soviet Union on all major international problems". While in Moscow, the joint communique continues, Swaran Singh "also discussed the serious situation created by the continuing stream of millions of refugees from East Pakistan coming into the adjoining States of India". The coincidence of views does not seem to have extended to this problem, but then it is a small matter.

In the annals of our foreign relations, it would be difficult to find a more pointless and fruitless errand. The only result seems to have been to reassure the Soviets (as that was necessary) that we do not intend to get involved in the civil war in Pakistan. The independence of Bangladesh is no longer the issue. We are worried primarily about the refugees. In other words, the Soviets have reason to feel relieved that the change in the political map of the sub continent is not imminent after all. The *status quo* faces no serious danger of alteration. Even if Swaran Singh wanted to emphasise this, the least he could have done was not link the fate of the hapless refugees with umpteen other problems of the world.

★ ★ ★

The main thrust of China's recent diplomatic offensive, whatever the local context—be it South Asia or South East Asia—is to prevent a convergence of interests between the Russians and the Americans. While adhering to this as the primary aim of its diplomacy, Peking has not lost sight of the purely Russian threat. It is in this latter context that Peking's active wooing of some East European countries must be regarded. Rumania, which for several years has stoutly followed an independent policy *vis a vis* the Soviet Union, is the obvious and willing choice for making the Russians feel slightly unsecured on their Western boundaries. The Chinese calculation is very likely to be that the encouragement of Sino Rumanian ties will make for greater Russian caution on their Eastern, i.e. Chinese, frontier.

In a significant speech last month Ceausescu strongly indicated that Rumania might be thinking of military co-operation with the Chinese. He declared that his country would henceforth be ready to co-operate with the armed forces of all socialist states regardless of whether they were members of the Warsaw Pact. By this he made it clear that military co-operation with the Yugoslavs and the Chinese could not be ruled out. This sort of suggestion is a breach of the spirit of the Warsaw Pact and is bound to worry the Kremlin—an effect which it was meant to have.

Upgrading Technology and Reducing Costs

Kumaran Pola

SANDVIK ASIA reported impressive improvement in operations and profitability for the year ended December 1990. The production of tungsten carbide products increased to 54.96 lakh, equivalent to 1062 kgs, from 49.58 lakh, equivalent to 1012 kgs, in the preceding year. The main raw materials and bought-out components consumed during the year were 104 tonnes of tungsten ore as against 136 tonnes in the preceding year, 11 tonnes of cobalt including cathodes as against 10 tonnes in 1989 and 18 tonnes of carbide powders as against 15 tonnes in 1989. These figures reflected the results of the measures taken by the company to improve the cost effectiveness in the manufacturing and process rationalisation areas. The imported raw materials and components formed 76 per cent of the cost of raw materials and components consumed during the year as

compared to 77 per cent in 1989. The company manufactures and markets cemented carbide cutting tools, wear parts and rock tools and mineral tools. The tungsten carbide products manufactured by the company include integral rock drill steels, bits, detachable bits, extension drill steel equipment, inserts, tips, dies, nibs, studs and other applications. Sandvik Asia is today the largest supplier of cemented carbide cutting tools which are marketed under the brand name 'Coromant'. It offers the most comprehensive range of sophisticated rock drilling and coal mining tools.

The company is making continuous and systematic effort to optimise energy/power consumption and to reduce the use of diesel and furnace oil per unit of various products. For instance, the company has on hand a proposal for the

modernisation of the hydrogen gas plant to be implemented in the next two years at a cost of Rs 3 crore. This will result in an energy saving of 30 per cent. The company is also pursuing actively research and development efforts. A collaboration agreement was entered into with AB Sandvik Coromant, Sweden, for a period of five years in October 1990 for enabling the company to undertake R and D projects in the areas of development of materials and processes, cutting tools designs and geometrics, new coatings, production technology, fundamental studies in related areas and recovery/recycling of tantalum and niobium from cutting tool scrap.

Though the company has increased its exports by 47 per cent from Rs 1.15 crore in 1989 to Rs 1.68 crore in 1990, the company's foreign exchange expenditure far exceeded its earnings. As against foreign exchange earnings of Rs 1.68 crore in 1990 and Rs 1.15 crore in 1989, foreign exchange expenditure totalled Rs 6.26 crore and Rs 8.98 crore, respectively. In addition, the company remitted Rs 59.40 lakh each during the two years on account of dividends.

As regards the prospects for 1991, the directors stated that factors like the foreign exchange crunch, Gulf war and the general economic climate since February 1991 had slowed down production in many industries such as automobiles, machine tools and engineering. This would have an adverse impact on the market for hard materials and cutting tools in the first half of the current year. However, the company hoped to introduce the latest designed coated inserts, tooling systems, and additional range of milling cutters which will improve the productivity of the user industries. The company made an investment of Rs 3.77 crore during 1990 to upgrade its products in the context of the steady replacement of outdated machinery by modern CNC machines, automatic presses and robotics in different industries the last three years.

The financial performance of the company improved during 1990 as reflected in an overall return on investment of 10.71 per cent. The company improved its assets utilisation and achieved for its shareholders Rs 1.10 of sales for every rupee of investment in assets as compared to Rs 0.98 of sales per rupee of investment in 1989. There was also improvement in the net profit margin on sales from 6.20 per cent in 1989 to 9.76 per cent in 1990. On shareholders' equity, the rate of return improved from 15.70 per cent to 25.54 per cent.

Due to higher generation of funds in-

funds got reduced as reflected in the debt/equity ratio of 0.601 in 1990 as against 0.711 in the preceding year. The liquidation of inventories by Rs 3.07 crore was more than offset by increases in receivables. The company's working capital position reflected a current ratio of 2.03 in 1990 as against 2.04 in the preceding year. The company reported a higher interest coverage ratio of 4.18 times in 1990 compared to 3.23 times in the preceding year.

MOTOR INDUSTRIES COMPANY

Expansion and Diversification

MOTOR INDUSTRIES COMPANY achieved marginal increases in production during the year ended December 1990. Production of fuel injection pumps increased to 1,038 in 1990 from 916 in the preceding year, spark plugs to 11,238 from 11,000, elements and delivery valves to 10,308 from 10,014, nozzles, nozzle holders, elements and delivery valves to 7,498 from 7,042 and filters and filter inserts to 1,172 from 1,156. Total raw materials, spare parts and components consumed during the year were valued at Rs 114.50 crore as compared to Rs 85.43 crore in the preceding year. Of this, 35 per cent consisted of imported raw materials, spare parts and components compared to 31 per cent in the preceding year.

Sales, excluding excise duty, but including export incentives of Rs 2.63 crore in 1990 and Rs 2.23 crore in 1989, amounted to Rs 285.87 crore. This showed an increase of 23 per cent over the preceding year. Export sales increased by 20 per cent, to Rs 26.11 crore compared to Rs 21.69 crore in the preceding year. The company exported 1.4 million spark plugs during 1990. Total foreign exchange earnings increased from Rs 21.90 crore in 1989 to Rs 26.35 crore, while foreign exchange expenditure increased from Rs 25.29 crore to Rs 29.48 crore. In addition, the company remitted Rs 2.18 crore in 1989 and Rs 2.04 crore in 1990 in foreign currency on account of dividends to non-resident shareholders. Among the user-industries of the company's products, there was a healthy growth in commercial vehicle production. The tractor market was also good. The single-cylinder pump market fluctuated and the spark plug market stayed steady.

Cost reduction and improvement in quality continue to be the two major objectives of the company. Rationalisation of heat treatment shop loads, modification for auto-stop of spindles of machine tools, introduction of solar heating and other measures were estimated to have saved energy to the extent of 470,000 kwh

per annum, a saving against the 7.72 crore by way of capital and revenue expenditure towards R and D in 1990. This represented 1.8 per cent of the total turnover. Development of new fuel injection systems to meet customer requirements in the national and export markets and developmental work on indigenisation of fuel injection equipment for engines with foreign technology were some of the R and D efforts during the year. Future plans include designing and developing single cylinder pumps used on tractors, vehicles and small generator engines for the Bosch Group, the company's collaborators, widening the range of products for export and development of fuel injection equipment with emphasis on reduction in fuel consumption and emissions. The company's R and D centre is recognised by the union ministry of science and technology. There is a continuous flow of technology information between the company and the Bosch Group. During the last five years the company imported technology for the following products: special purpose machines (1986), honing machines (1986), auto electricals (1988) and hydraulics (1989).

The company's third production facility was inaugurated in December 1990. Production of auto electrical items is proposed to be concentrated at this modern plant. The company also completed the shifting of spark plug assembly lines to Naganathapura. The company made pilot

Bangalore works. Bulk production commenced recently. The company will make pilot supplies of proportional and directional control valves from the middle of 1991.

Motor Industries Company became the first company in the automotive industry to be conferred self-certification status by the Directorate General of Quality Assurance, Ministry of Defence. The company adopted 12 quality principles which are binding on all employees and arranged a suppliers' meet during the year to familiarise suppliers with the guidelines for supplier quality assurance and assessment. The company initiated measures to fulfil the requirements of ISO 9000 adopted by the European Community. In the area of human resources development, the company imparted advanced training in quality and advanced technology related areas to over 2,100 employees in 1990. The company trained 291 apprentices under various statutory schemes.

Despite the improvement in production and sales, profitability was eroded during the year. The overall return on investment worked out lower at 6.94 per cent in 1990 compared to 9.07 per cent in the preceding year. The company generated lower sales of Rs 1.33 per Re 1 of investment in total assets during the year. The assets utilisation was Rs 1.45 of sales per Re 1 of investment in the preceding year. Even the net profit margin on sales showed a

decline from 6.27 per cent in 1989 to 5.22 per cent in 1990.

The company was obliged to resort to short-term and long-term borrowings which increased by Rs 18.91 crore and Rs 12.09 crore, respectively. Fixed assets increased by Rs 15.90 crore during the year. The additions were mainly in plant and machinery.

Apart from the increase in the assets base, the factor which depressed profitability was the measures introduced in Taxation Laws (Amendment) Act, 1991 which necessitated a substantial increase in tax provision. This resulted in only a nominal increase in net profit after tax.

FAIRGROWTH FINANCIAL SERVICES

Impressive Beginning

FAIRGROWTH FINANCIAL SERVICES, which was incorporated on July 9, 1990 with registered office at Bangalore, commenced business operations from August 10, 1990. In the nine-month period ended March 31, 1991, Fairgrowth Financial Services put into operation all the infrastructural facilities including premises, manpower and communication in its nationwide network of seven branches in addition to the registered office and launched its full range of activities.

The company today is in a position to provide a comprehensive package of financial services, including equipment leasing, hire purchase and consumer financing. The company also provides investment management services, bills discounting facilities and capital market operations. The spectrum of services under corporate advisory and industrial consultancy services includes advice on mergers and acquisitions, project finance and counselling, preparation of project reports, market surveys and recruitment, tax and management consultancy. The chairman's statement notes that with the Eighth Plan on the anvil and investment priorities being finalised, there is expectation that financial services companies will be called upon to play an expanding role in resource mobilisation efforts. Public sector undertakings will further increase their reliance on direct borrowings. Another development favourable to the financial services industry is the recent trend towards 'disintermediation' in banking which is the inevitable outcome, *inter alia*, of the deepening and widening of the capital market. The chairman's statement expects that securitisation of credit will in due course come to other areas like consumer and trade credit.

During a short span of nine months, Fairgrowth has established itself in the fast growing financial services industry. It was

involved in equity issues together with other companies. The company was granted Category I Merchant Banker status in December 1990 by the Securities and Exchange Board of India (SEBI). The company also became a member of the Cochin Stock Exchange.

The company has done well in leasing, sanctioning leased assets of Rs 5.50 crore. Disbursements were Rs 3.14 crore as on March 31, 1991. The company generated an income of Rs 39 lakh from this activity. The member of lease accounts stood at 21. The company has set a target of Rs 30 crore for cumulative lease for 1991-92.

Total sanctions in respect of hire purchase and consumer financing services put together were Rs 4 crore as on March 31, 1991. The stock on hire amounted to Rs 3.38 crore. Projected cumulative disbursements for 1991-92 in hire purchase/consumer financing are Rs 25 crore.

Fairgrowth emerged as an active player in bills/securities market during the year. Total outstanding amount in respect of bills discounting/bills financing stood at Rs 7.58 crore and the company was holding a stock of securities worth Rs 3.87 crore. In merchant banking in addition to tying up 40 public/rights issues, the company entered into underwriting or standby commitments of Rs 8 crore and launched its portfolio management scheme called 'Dividendz'. The company aims to concentrate on asset-based financing activities and an asset base of Rs 60 crore is projected for 1991-92 as against Rs 19 crore in the first year of operations.

On the basis of the balance-sheet figures, the company mobilised a total of Rs 60.73 crore during the year. The sources of funds were share capital Rs 1 crore, reserves and surplus Rs 1.02 crore, current liabilities and provisions (including share application money of Rs 2.60 crore) Rs 44.26 crore, short-term borrowings Rs 11.75 crore and long-term borrowings Rs 2.70 crore. The funds were utilised in fixed assets Rs 4.97 crore, inventories of shares and securities and stock of assets on hire Rs 7.25 crore, receivables which included lease and hire purchase debtors Rs 28 crore, cash and bank balances Rs 7.25 crore, miscellaneous current assets such as bills of exchange and share application money paid Rs 12.71 crore, investments in subsidiary companies Rs 0.45 crore and intangible assets in the form of capitalisation of deferred revenue expenditure not written off Rs 0.09 crore.

Fairgrowth achieved a return on investment of 1.83 per cent in 1990-91. However, on the shareholders' funds, the return was an impressive 54.95 per cent. The debt-equity ratio worked out at 7.15 per cent. The interest coverage ratio was comfortable at 2.22 times.

Year of Turmoil

ANDHRA PRADESH STATE ROAD TRANSPORT CORPORATION (APSRTC) incurred a loss of Rs 10 crore during the year ended March 31, 1991. The corporation went through a year of turmoil in 1990-91. In May 1990, there was a severe cyclone in the coastal districts of the State which disrupted both railway and road transport for more than three weeks. The loss in revenue on account of this natural calamity was estimated at Rs 10 crore and loss to property and workshops at Vijayawada as well as depots was estimated at Rs 5 crore. The corporation could not operate 47 lakh kms during the months of August and September 1990 on account of the agitation connected with the implementation of the Mandal Commission report. About 1,000 buses were damaged during the agitation. The Mandir-Masjid controversy and the resultant communal flare-up led to the burning of 28 buses and non-operation of 1.81 crore kms. This was estimated to have caused a loss of Rs 10 crore.

The Gulf crisis led to a 10 per cent rise in diesel oil causing the stabling of 2,000 buses, resulting in an estimated loss of Rs 25 crore. In the areas affected by Naxalite activity the corporation lost 123 buses in the course of the year, the estimated loss on this account being Rs 6 crore.

The APSRTC inducted 1,600 buses into its fleet in 1990-91 at a cost of Rs 85 crore. This was financed by loans of Rs 42 crore from IDBI and LIC and internal accruals. The company repaid earlier loans of Rs 33 crore and accrued interest of Rs 10 crore.

The corporation introduced the concept of mofussil bus services around municipal towns. 32 municipal towns have been identified for the purpose. Shuttle services have been introduced to connect district headquarters. There was augmentation of inter-State services. About 150 buses to Karnataka and 65 buses to Maharashtra would be added in the immediate future. By way of public amenities, 49 bus stations have been constructed during the year at a cost of Rs 8 crore. Another Rs 3 crore was spent for acquiring land for the purpose. The corporation spent Rs 2 crore on enlarging its computer facilities.

In view of the worsening traffic situation in Hyderabad city, RITES was entrusted with consultancy work to recommend the best possible rapid transit system for the city. A light rail transit system has been recommended as the best proposition for Hyderabad.

Calcutta Diary

AM

Rajiv Gandhi's assassination should have provided the occasion for a general political spring-cleaning. Unfortunately, it has not, at least not till now, and there are few signs that, unless pushed by circumstances, overall political behaviour in the country will undergo any qualitative transformation in the near future. The nation will, therefore, continue to stagger from one crisis to the next.

WHY not say it? The standard first query in a murder investigation is on the identity of the person likely to benefit from the crime. This is the reason for the raised eyebrows at the manner the Congress(I) party has gone about in the past few weeks, squeezing the maximum electoral advantage from the doing away of its president. The assassination has indeed left the party totally without its co-ordinates. We are therefore once more face to face with the Joan Robinson riddle: make any generalisation about India, its obverse is equally true. The murder, brutally planned and executed, packed a whole lot of hatred. But should we none theless withhold to hate the four flushers who, right in the midst of the trauma the nation is in, try to hustle the mourning widow into taking over the helmsmanship of the slain husband's party? If she would not fall for the trap, why not entice the teenage daughter by dangling the crown of the Youth Congress before her? After all this one is almost attuned to listening to the cynical whisperings that are on the pity of it, if only he had been done to death a couple of days ago: the first phase of the elections too could have benefited from the sympathy wave. According to the opinion of the nation's supreme judiciary, the chief election commissioner has the prerogative to countermand elections wholesale, why not in any event make a last ditch effort by appealing to him? One Congress(I) lining newspaper has not failed in the task. The dastardly occurrence on the night of May 21, has, it has argued in beautiful prose, ushered in a qualitatively different situation in the country, it is somehow unfair that the general elections, which ought to be held simultaneously all over the country, would have to bear the blemish on account of this schizophrenia, please, in the circumstances, should not the chief election commissioner boldly order fresh elections in each of the two hundred-odd constituencies where voting had taken place on the day preceding the heinous assassination?

Proposals of such an outrageous nature are posted without the least sign of embarrassment, politics, after all, is the art of survival. Secularism above all, the party is pledged to fight to its last breath the pernicious doctrine of Hindutva. But such constraints must not intrude when the party is tackling the most serious crisis in its career. The calculations are fine-tuned: the near chaos in the first party of the nation could not but induce the leaders and the cadres of

the Bharatiya Janata Party to invoke, in the final phase of the electoral battle, the 'killer instinct', the display of exuberance on their part would scare the daylight out of the citizenry belonging to minority communities, for dear life, they would vote *en masse* for the party most likely to succeed against the BJP, which, in current reckoning, is bound to be the Congress(I). With the minority vote thus assured, the party should now have no qualms to go all out to recapture the loyalty of the majority community. Secularism therefore deserves to be shoved aside for the next fortnight, it has to be a purposeful elongated carnival of the grossest Hindu rituals all the way to Kanyakumari, the government has thought fully provided both special trains and Black Cats, the guarding minstrels, the urns carrying the murdered former prime minister's ashes would therefore have the maximum exposure, Doordarshan praise be to it, had already done its preliminary bit. The obnoxious doctrine of Hindutva has to be fought all the way: however use a thorn, the scripture advise to remove a thorn. The Hindu ambivalence which some would describe as upidity emerges resplendently triumphant. On a Hindu you are always deemed to be a Hindu despite how many number of times you openly repudiate the faith. Similarly, once the nation has been labelled a secular republic, it is for keeps a secular republic, irrespective of the systematic violation of rudimentary secular principles directly under the auspices of the state, such as the unabashed sponsoring of Hindu rituals under the pretext of organising a state funeral.

The murder has thus provided no shock therapy. The foreign born widow of the felled former prime minister has, as of this moment, refused to go along, otherwise the script appears to be entirely according to order. Hypocrisy continues to be the guiding spirit in whatever the party says and does. To allay the doubts in some minds whether or not the murdered leader was not already divine, he is conferred, post haste, posthumous divinity. Much of the current mess in Punjab and Kashmir is the product of exclusive misdoings on the part of Rajiv Gandhi and his mother, the latuous accords he was in the habit of signing every now and then actually further destabilised law and order in the different corners of the country, the authoritarianism he graduated into in the course of his tenure as prime minister was no less egregious than the mother's, and

resulted in the further worsening of Centre-State relations, as prime minister, he gave respectability to the point of view that, as far as economics is concerned, the poor were not relevant, only the minuscule rich and the precious foreigners were, the nation, that is, that segment of it which mattered, was accordingly invited to plunge into a great liberal hoopla, and foreign exchange was considered to be a free commodity like air or water, if you happen to be short of it, why bother, just borrow, the country's total external debt consequently jumped five times over the short span of five years, it is henceforth a deadly debt trap. He, Rajiv Gandhi, drove the last nail into the coffin of his grandfather's dream of a self-reliant, self-sustaining economy, the backroom boys he strategically placed in the nooks and corners of government are now busy preparing memoranda and schedules of understanding whereby a major slice of the nation's sovereignty is proposed to be pliantly gifted to foreigners. If fundamentalists of assorted hues are currently holding the nation to ransom, should not the accountability for that too be laid at the door of his famous vacillations? A notification in 1986 under the Preservation of Ancient Monuments Act could have taken care, at inception, of the Babri Masjid Ram Janmabhoomi squabble. He, Rajiv Gandhi, however spurned earnest advice pouring in from scholars and secular-minded public men. He was instead much taken up by the exciting idea that Indian secularism does not mean separating the state from the church and the temple and the darga and the gurudwara and the synagogue, the state, on the contrary, should take turns to be sweetly reasonable to each and every religious denomination. *Ramayan Mahabharata* on the Doordarshan screen has been without question the single biggest factor stoking Hindu revivalism in the country. Rajiv Gandhi's men considered that to be one of their grandest achievements, and proceeded to balance their scale of secularism by commissioning inanities from the Bible and canonising the sword of Tipu Sultan. The folly did not quite stop here. The computer boys informed Indira Gandhi's offspring that he could sail through the 1989 elections by playing the straight Hindu card, since a card is a card, he rushed to sign one further accord, this time with the goons of the Vishwa Hindu Parishad, he nodded his concurrence with the first *shilanka* and co-opted the slogan of Ram Rajya as his opening gambit in the poll campaign. Naivete was his second nature, these insolences, he genuinely thought, could be compensated by slapping down a ban on Salman Rushdie.

India is no longer much of a nation. There is little point in dissembling, that such is the state of affairs is almost entirely attributable to the later doings of the Nehru Gandhis. More than others, the pall bearers of the Congress(I) ought to take cognisance of this simple reality: their present plight is not on account of the accursed times, it is because they allowed themselves to be blindly led by

the dynasty into the thralldom of authoritarianism. The party has now begun to dilate on the need for internal democratisation. Even so, it cannot restrain itself from the temptation to seek votes by putting on display the dying embers of the dynasty. Few, very few, in the party have yet developed the perception to identify the nature of the hiatus between their pledges and their propensities.

Does not part of the same complaint hold against those who proclaim themselves to be as much against Hindu obscurantism as against the Congress(I) variant of ersatz secularism? The fundamentalists threatening to overrun the nation are not waving the flag of Hindutva alone; they are also collecting the crowd by their supra-nationalist harangues on Punjab and Kashmir; a horrendous spirit of jingoism is consequently abroad in many parts of the country. The cult of high defence outlay, and of an ample nuclear deterrent accompanying it, is an additional stock-in-trade of the rampaging demagogues. Their version of nationalism would once upon a time not look askance at the notion of self-contained, self-reliant growth. No longer. Big business has caught on to the possibilities latent in Hindu obscurantism. It is a unipolar world; the Americans, the masters of all they behold, have revised their manuals; they are about to smoke the pipe of peace with the fundamentalists in West Asia. If Islamic obscurantists are acceptable to Foggy Bottom, Hindu fundamentalists too can then live on hope, the deep is bound to respond to the deep. The BJP has therefore been duly briefed; it has decided to go the whole hog to welcome, lock, stock and barrel, the grand panacea of economic liberalisation.

The battle obviously has to be joined. The supposedly Left and democratic political alternative in the country can hardly hope to make itself credible by toeing the fundamentalist line on Punjab and Kashmir; it has to strike out on its own. State violence, it must have the courage to assert, is no answer to discontent which has its roots in mass deprivation. The unrest in Assam too is a direct outcome of the most perverse application of the imperial principle in Centre-State arrangements. On all such matters, including the issue of inordinately high defence expenditure and defence imports which only help domestic commission agents and foreign armament merchants, the Left has to shed its post-1962 psychosis. Rajiv Gandhi's assassination should have provided the occasion for a general spring-cleaning. Unfortunately, it has not, at least not till now, and there are few signs that, unless pushed by circumstances, overall political behaviour in the country is to undergo any qualitative transformation in the near future. The nation will therefore continue to stagger from one crisis to the next. That is, in case it still survives as a nation, so many funny things could happen while one is on one's way to the amphitheatre.

NOTICE

1. It is hereby notified for the information of the public that AMBALAL SARABHAI ENTERPRISES LIMITED (Divn.: SARABHAI CHEMICALS), BARODA-390 007 proposes to give to the Central Government in the Department of Company Affairs, New Delhi, a notice under sub-section (I) of section 21 of the Monopolies & Restrictive Trade Practices Act, 1969, for substantial expansion of its activities. Brief particulars of the proposal is as under.

(i) Name(s) of person(s)/Body Corporate owning the Undertaking : AMBALAL SARABHAI ENTERPRISES LIMITED

(ii) Capital structure of the applicant Undertaking

Authorised Capital (Equity) : Rs. 65,00,00,000

Subscribed Capital (Equity) : Rs. 18,78,33,410

Paid-up Capital (Equity) : Rs. 18,78,33,410

(iii) Details of the proposed substantial expansion

(a) Name of new goods to be produced, supplied, controlled or distributed or of new services to be rendered : LEVAMISOLE formulations - Vet

1. Capacity before expansion : NIL

2. Expansion proposed : LEVAMISOLE formulations-Vet. - 2 lac.pkgs. equivalent to 2000 kgs. of active ingredient (Levamisole hydrochloride) to be used.

3. Location of the Project for substantial expansion : BARODA (Gujarat)

4. Brief outlines of the cost of the Project, the Scheme and source of finance : No capital expenditure involved. Product to be manufactured in the existing plant with no additional equipment.

2. Any person interested in the matter may make a representation to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this Notice, intimating his views on the proposal and indicating the nature of his interest therein

For AMBALAL SARABHAI ENTERPRISES LIMITED
(Divn.: Sarabhai Chemicals)

Trade Reform for Restructuring the Economy

Arun Ghosh

We do need to liberate the Indian economy from the shackles of bureaucratic control, but trade reform of the type recommended by the World Bank is certainly not the first step in this direction

ONE of the problems with neo-classical economics is that it relies heavily on algebra. It tends to forget that human behaviour (and responses) cannot always be fitted into neat algebraic equations. The usefulness of the equations—to transform a familiar quotation from Tarlok Singh, the doyen among Indian planners today—rests on a recognition of the limitations of these equations. Unfortunately, when one works out delightful equations (sometimes based on questionable data), the fascination of using these equations for purposes of prediction remains. Indeed, the desire for prediction is usually too great to resist.

One cannot blame the latest World Bank report on India, 'Strategy for Trade Reform', of the above weakness because what is available to the Indian public is only the Executive Summary. It is only this summary which has of late been discussed in some detail by four eminent Indian economists, in the pages of *The Economic Times*, Delhi (over June 5 and 6, 1991, based on the essence of the summary reproduced in *The Economic Times* earlier).

The full report is obviously a matter between the government of India and the World Bank, and with India's exchange reserves in a state of near bankruptcy and a bailing out operation by the IMF/World Bank and the consortium countries being contingent on a policy package acceptable to lenders—one can argue that a document of such vital importance should be made public and not kept under the wraps. The summary promises rich economic analysis and it is not necessary that it should be acceptable to all sundry for its publication. In any case, all donor countries have copies of the report.

PROBLEM OF RESTRUCTURING

For the present, however, one has to make do with the Executive Summary. One must at the outset admit that the summary makes a plausible case for certain major policy changes. But three preliminary points must be made. First, as Mrinal Datta Chaudhuri has very pertinently pointed out, the trade policy

reform suggested assumes that trade reform can be financed from export earnings. In Datta Chaudhuri's words, "The Indian industrial economy has been more or less autarkic for a long period; the restructuring process will have to be financed through a credit line from abroad. The second aspect into which the report does not go into is the kind of organisational reform any reform of the trade regime must presuppose. This will require changing the climate in which industrial relations work, which will affect labour laws in the Indian industry. These are not easy tasks." Secondly, Kirit Parikh—who has suggested that "it will be worthwhile to proceed with the reform"—has stated categorically that "it may take some time before the benefits flow down to the poor. Meanwhile, positive action must be taken for poverty alleviation. With or without these reforms, a nationwide employment guarantee scheme (EGS) is needed and can be financed without raising fiscal deficit if all other subsidies, including the implicit ones to mostly well off segments of society, are withdrawn." Finally, as Y. K. Alagh (who admits that a "number of measures suggested have to be taken anyway") points out, the difficulty with the World Bank is an ideological stance of latching on India's economy to the daily vicissitudes of the world economy, and little awareness of a knowledge based path to it—that general prescriptions are inefficient, as shown by the IMF's chief economist, Mohsin Khan, in the sense of leading to negative growth in many countries through a long period, has been substantiated by MIT's Professor Lance Taylor's work on 18 countries in a project.

Three extensive quotations from *The Economic Times* have been given—I have not referred to the fourth comment by Amiya Bagchi who has opposed the World Bank prescriptions—partly because the three economists quoted are generally in favour of trade reform and yet seem to have doubts on the policy package recommended, and partly because all three of them hint at the problem of 'restructuring' of the Indian industrial economy. We have to consider our policy

options in the context of the extremely difficult and delicate situation that has developed within India, as a result of the unbalanced growth (both as between regions and as between different sections of the community) that has occurred over the past decade. That there has been faster growth than in the past during the eighties will be questioned by none. What is being asked today is at what cost this growth has been achieved, and whether different segments of the economy can be turned on and off today at will by the central authorities when social tensions are at a boiling point. The question also arises as to how to tackle the extremely fragile balance of payments situation coupled with the large internal deficit, even as there is a just demand for some form of employment guarantee programme, so that the World Bank's assumptions regarding a *reduction* in the fiscal deficit may not be realistic. And this raises the whole problem of how to plan simultaneously for the resurrection of the economy from the horrendous position it has managed to get into (within the short space of a decade maybe less—perhaps a bare five/six years) and at the same time make a dent on the illiteracy, lack of health, rapidly expanding population increasing inequality of incomes—not only between different sections of the population but also as between different regions—which is now threatening to tear the country apart. How does one simultaneously achieve the structural reforms recommended by the Bank and growth of the economy which would be more egalitarian and 'acceptable' to the Indian people? How does one mesh the immediate short term problem of tiding over the present balance of payments crisis with the longer term problem of initiating a process of self-sustaining growth of the economy? That is in essence the problem. But we need first a brief explanation of the outlines of the World Bank report.

TRADE REGIME REFORM

The Summary Report of the Bank recommends simplifying the import/export trade control regime so as to, in a sense, globalise the Indian production structure in three phases, and also, at the same time, bring about macro economic balance in the economy primarily through a sharp reduction in the fiscal deficit of the government of India. The simplification of the trade regime should aim at: (i) bringing down all import duties (within a period of five to seven years) to something like 20 per cent flat on all imports (including all consumer goods); (ii) abolishing all quantitative restrictions

air transports (again, over time); (iii) introduction of transparency in the import control system by introducing the Harmonised System (HS) of product classification for import licensing purposes; and (iv) starting with a *real* devaluation of some 20 per cent immediately, in order to make exports more profitable and imports more difficult (in the face of a first stage reduction of import duties on all capital goods and intermediate products).

In fact, the Summary Report spells the various steps of the trade regime reform programme as follows:

- a) redesign import policy in accordance with the HS system of classification;
- b) create one negative (restricted) List;
- c) allow all items that are not explicitly on the restricted list to be imported through REP licences;
- d) have all intermediate goods and raw materials off the restricted list into categories that are importable by REP licences; move the intermediate products already imported under REP into OGL stock and sale category; continue this policy so that all raw materials and intermediate goods end up on OGL stock and sale;
- e) move all capital goods in the restricted list to being importable under REP licences and then to OGL stock and sale;
- f) move consumer goods from the restricted list to being importable through REP licences; and
- g) ultimately, move all goods into OGL stock and sale category.

The first three recommendations can, the report says, be implemented immediately. Steps (d) and (e) can be undertaken over the next three-four years. The last two steps can then be implemented after that—along with the recommended tariffs, exchange rates—and other macro-economic adjustments should make it possible to eliminate the QR system completely within five to seven years.

I have deliberately repeated only the *major* elements of the policy prescriptions because the summary of the report is not available to all readers. Neither the GOI nor the World Bank has publicised even the Summary Report. (I have focused on the major policy prescriptions, and not on the details, and I have also left out the recommendations as to fiscal reform. Of course, the three para summary above is an attempt to cull out the essence of a 16-page report, and I may be forgiven for not mentioning the other elements, e.g. the tariff and other reforms in as great detail as the proposal for reform of the trade regime.)

One last word. The report has emphasised the importance of acceptance of the entire package; piecemeal implementation just would not work.

Let me make two initial points. First, there is no doubt that over the years, our trade policy has become extremely complex. What is worse, policy changes from time to time have become highly discretionary and, indeed, have of late become a source of corruption. Simplification and transparency of the system are therefore two very important recommendations on which there is unlikely to be any disagreement. In fact, the de-bureaucratisation of the trade regime is an urgent reform; and one should extend wholehearted support to: (a) the transformation of the import control regime to the HS classification—a move which was initiated by V P Singh during his tenure as commerce minister, which has to this day not been implemented; and (b) the simplification of both the tariff and the import control system. There is no justification for very high import duties on key intermediates, just as there is no justification for the import duty on capital goods to range from zero to 85 per cent (*plus* auxiliary duties and countervailing duty).

There is also considerable merit, in the existing framework, for focusing on a gradual shift from discretionary AU licensing (for selected industries) to REP licensing which may maintain neutrality, in regard to the balance of payments, of any change made in the licensing system.

Having said this, and without prejudice to the *rates* of duty (which the Bank report accepts must in part be guided by revenue considerations also), there is a very good case for having fewer slabs of customs (as well as excise) duties, if for no reason other than to simplify the administration of the system. In theory, one can argue that *one* unique rate of duty would lead to the most efficient allocation of resources; but the argument also presumes some degree of egalitarianism in the distribution of income in the country, so the allocative efficiency criterion falls to the ground because the market itself is fragmented, highly segmented, and even the production structure is not really competitive but highly oligopolistic, with a strong tendency towards cartelisation. (This tendency can, of course, be broken, but that is another issue.)

INTERNAL COMPETITION

There are several points which the Bank report has not taken into consideration, and one may perhaps focus on these *major issues* rather than offer detailed comments on individual points made. First, as Alagh has rightly pointed out, we must have internal competition before forcing our entrepreneurs to face external competition. That, in itself, will bring to the fore the problem of exit, of rehabilitation and restructuring, of a fund for the re-training and redeployment of labour.

Take the case of the Indian sugar industry. There was a time—and perhaps the situation obtains even today—when almost every sugar factory in the country had a separate price for the 'levy' sugar supplied by it to the authorities. Even as of today, every fertiliser factory has a separate retention price. These are but two examples. We have, *for reasons other than economic*, managed to develop a highly complex industrial structure; and no external trade liberalisation is necessary to simplify this system.

The instance of the fertiliser industry brings to mind another issue overlooked in the World Bank report. During the eighties, a number of natural gas-based nitrogenous fertiliser plants were set up in the country, based on Haldor-Topsoe/Snamprogetti technology, with a standard size (deemed internationally economic) of 1,350 tonnes of ammonia per day. Under pressure from *all* parties, the import duty on all fertiliser equipment was reduced to zero; and three plants were set up on a 'turnkey' basis. The World Bank has separately found that a similar plant, based on similar technology, was set up in Thailand at around the same time, at *two-thirds* the capital cost of the Indian plants. The zero import duty on capital goods in India led to a jacking up of the export price of equipment under 'tied aid'.

How is the drastic reduction of the import duty on capital goods going to help India if equipment supplied under 'tied aid' programmes is high priced? Who in the world would have bought the Westland helicopter when we did? Will the donor countries agree to complete untying of aid in the coming years when the Indian economy is being restructured? It is well known that imported power plant equipment is—duty apart—significantly more expensive than domestically produced equipment. Our power costs are going up because our savings rate is not enough to finance our investment programme; and the tied aid we are forced to use is raising capital costs of projects all round. A massive aid programme—increasing the quantum of 'tied aid', associated with the tariff and import policies recommended—will *not* reduce our investment cost and will get us deeper into the debt trap.

So the first need is for us to be 'self-reliant' in the sense that our exports should be enough to finance *all* our imports, including project imports, and that requires as a first step that domestic savings should be equal to domestic investment. Our domestic savings have declined during the eighties by some 2 to 3 per cent of the GDP. Reduction of the fiscal deficit may help in the process of increasing the savings rate but it all depends on *how* the fiscal deficit is to be reduced. We need to reduce the consumption of the affluent, not of the poor; and

are unlikely to achieve that objective. The Bank study has recommended that the required adjustment be made through a reduction of government consumption, which is fine. But *how* is government to reduce its consumption expenditure? Kirit Parikh, in his perceptive comments, has suggested a cut in *implicit* subsidies which help the affluent sections of the population (which, in the aggregate amount to a large figure, pace the study by Mundle and Rao in the *EPW* of May 11); Parikh has also suggested at the same time an employment guarantee scheme so that every citizen is assured of a minimum income. Such a programme would be very far from the type of adjustment programme that the World Bank study seems to recommend.

Every study by neo-classical economists one sees seeks to compare the Indian scenario with that of Japan, South Korea, Taiwan, Thailand, Malaysia. Everyone forgets that: (a) countries like Japan and South Korea started with land reform and education for all; and (b) both Japan and South Korea had extremely 'controlled' economies, with active co-operation between industry and government in the matter of domestic R and D, absorption, adaptation and development of imported technology by domestic investors, and highly selective import of technology. It is only now, after industry has matured, that it has got greater freedom; but even so, they appear to observe certain norms in regard to the balance of payments. The Indian industrial culture is still a culture imbued with the making of quick profits. Doubtless, the present system has aided and abetted this culture, but we have to ensure, while introducing the reform package, that we do not "throw the baby out with the bath water".

RESTRUCTURING INDUSTRY

There is a very good case for cheapening key intermediates, and for improving the efficiency of the capital goods sector. This is one area where innovative ways have to be thought of so that the user industries do not suffer. For example, in the case of alloy steel, we could write off part of the capital of the Alloy Steel Plant, and then make it face competition. The World Bank study mentions that the capital of private mini-steel plants is already fully depreciated, but it does not even mention the ASP which is the largest producer. In fertilisers, we need not determine the location, the size and the technology of plants to be set up, and we should throw the field open. In Bristol, a small plant (two sets of ammonia units each with 400 tpd capacity as against the much-touted Topsoe technology of 1,350 tpd introduced in India with foreign aid)

of ammonia as against 8.5 million units required by our 'technologically latest' Topsoe plants. For improving the efficiency of the capital goods sector, we need to selectively import technology, backed up by R and D and indigenous design engineering capability. But then, we must also ensure that they get orders for plant and equipment for our projects and are not left out in the cold because of the availability of 'tied aid' and the inadequacy of domestic savings generally and of finance for projects in particular. In the steel industry, our blast furnace productivity (hot metal output per cubic metre of furnace capacity) is today around 40 per cent of the Japanese rate (or somewhat less); and *most* of the reasons arise from management weaknesses, though part of the reason is the type of coking coal available. But it should be possible, with minor adjustments (e.g. to ensure uniformity of inputs) and better management of the technical parameters (like blast temperature and top gas pressure, etc) to *double* blast furnace productivity, which should immediately reduce the cost of pig iron substantially. The same goes for the steel melting shop and other facilities. We do not need devaluation of the rupee to achieve competitiveness in the steel industry. In fact, devaluation would only breed complacency because the plant authorities would then have lower than international prices without any effort. One could go on citing case after case wherein the solutions are known, but we seem to get caught up in a medley of confusion much of which has to do with the decline of morale in public sector enterprises arising from political and bureaucratic interference with the functioning of these enterprises. The remedies are known; it is not necessary to discuss them here.

The brief point is that restructuring of Indian industry would have to follow different methods and allow different incentives/disincentives in different industries. *General* remedies can be applied only later, with their own costs and rewards.

Indeed, it is a somewhat complex situation in which the real culprit is the shortage of domestic savings to finance domestic investment. For each industry, we need specific solutions, until our own savings rate goes up; and the Bank staff studying India for years now, with access to every type of data (not normally available to Indian researchers) should know that different industries need different remedies. True, they all need competition, but not in the manner or of the type proposed. We first need genuine competition within the country. Secondly, we have to carefully modulate the sectors opened up for import competition, because with the present highly skewed

try, the Bank report prescriptions will (a) create an immediate shut-down of a large part of Indian industry; (b) thereby add large numbers to the already unemployed population; (c) only help to improve the well-being (or consumption standards) of some 100 million Indians (out of the present population of some 845 million); and (d) as a result, create social tensions which may tear the country apart.

That is why Kirit Parikh, while recommending that we move towards reform of the type suggested, has stated categorically that reform must be accompanied by an employment guarantee scheme. How is one to operate an EGS if, say, a million factory workers are suddenly thrown out of their jobs because of plant shut-down as a result of the Bank recommended strategy?

POLITICAL ECONOMY APPROACH

This is why, as I started by saying, neo-classical economics appears to have lost touch with reality. What we need is a revival of *political economy*, based on an understanding of the guts of the problem of the Indian economy.

And the guts of the problem, the reason for the low productivity in India, lie in lack of education, lack of skills, lack of health—most people do not have the physical energy to put in eight hours' hard work because of malnutrition—lack of infant and maternity care (which in turn is partly responsible for the unrelenting growth of the population). In agriculture, the problem arises from the rapid loss of fertility and desertification of the land because of the loss of tree cover, formation of gullies, and increasing lack of capacity of the soil to retain moisture. What we need for agricultural growth is local 'watershed area' planning, suited to each locale, improving the moisture retention capacity of the soil (or improving drainage where necessary), and a cropping pattern suited to each area. The Bank staff—and many others—talk of increasing inputs of chemical fertilisers when many countries in the West are moving back to organic fertilisers and to the use of bacteria (like *Rhizobium*) for improving soil fertility.

What we need urgently in this country is to improve the productivity of the soil in 70 per cent of the cultivated area which is still unirrigated. What we need to focus on is the improvement of education and health of the people. What we need is massive investment for rural infrastructure—which can only become possible with decentralisation of political and economic authority and the devolution of the requisite funds, together with the required *organisational support* (like the

supply of scientific data of the type available from satellite imagery to the local authorities) to help the people to plan their own local development programmes. What we need is external aid for supporting programmes for harnessing solar energy, in order to provide a minimum of energy to all households. That alone will reduce the felling of trees and the steady deterioration of soil fertility in large parts of the country. We do need a break from the financing of mega industrial projects by the government and, to that extent, the Bank study may help to temper the pace of such investments. But that is not the way to stop ill-directed industrialisation. A carefully modulated trade reform is necessary because, as Mrinal Datta Chaudhuri has pointed out, our industrial structure has become highly complex and we seem to have succeeded in discouraging innovativeness. But the Bank-recommended package is certainly not the answer to our present problems.

Liberalisation does achieve decentralisation—through private sector decision making—but the type of liberalisation recommended is likely to run counter to the more important needs of budgetary support for an employment guarantee programme, and social expenditure on education and health, et al. The way to achieve this objective is through decentralisation of political and economic authority, a transfer of funds under centrally sponsored schemes to the States and from the States to the local authorities, a reduction of the overt subsidies, a reduction in defence expenditure and greater reliance on diplomacy, and a genuine beginning of economic co-operation within the region, which would make for a shift in the allocation of resources to a more efficient pattern of production. This does not need the type of liberalisation recommended in the World Bank study.

Let me admit that we do need reduced government regulation of production and investment decisions by domestic entrepreneurs. We also need less of government regulation in regard to technology decisions, but only in regard to certain sectors. What we do *not* need is the proliferation of technology for the manufacture of items like soft drinks and fast foods. The concepts of consumer choice and of a free market are myths. The consumer is conditioned by TV advertisements and by what his neighbour is doing. There is no free market because in Delhi alone the same products have a price range extending to a difference of 200 per cent in different areas. Nor is a free market of any use to a bonded labourer with no monetary income. We are trying to apply the rules of the game relevant to a developed, Western society on an entirely

The reform of the trade regime in India is important, but not the most important need of the day. Nor is the package prescription of the Bank study likely to help India even to achieve the limited objective of trade reform because it may get the country enmeshed in both a widening internal and external deficit. True, the Bank study has, at the end, made certain recommendations which will, *for a brief period*, contain the external imbalance. But we are apt to forget that there are severe limits to what exchange rate changes can achieve because of demand/supply inelasticities and, in the process, we can lose heavily on the terms of trade. (See, V Bhaskar, 'Export Promotion, Exchange Rates and Commodity Prices', *EPW*, May 18, as one of several studies relevant in this context.)

TO WHAT PURPOSE?

There are several other questions that arise. After implementation of all the reforms recommended, the various economic simulations predict the current account deficit in the balance of payments to remain the same (even after five to seven years) as in the base year, namely, 3 per cent of the GDP (*vide* Table 18 of the Executive Summary). At the same time, overall output declines under all assumptions, the decline in machinery output ranging from 10.5 per cent to 16.6 per cent under different assumptions. So does the output of metals (the percentage decline under different assumptions being

ment declines, as do electrical appliances and electronics. We are left with a small growth in output of agriculture (ranging from 0.3 per cent to 0.9 per cent) and a reasonable growth of minerals output (ranging from 1 per cent to 4.3 per cent). Construction declines or increases marginally under different assumptions, the output of services goes up—how, one is not quite sure because their growth should depend on the growth of production of goods.

What is the purpose of the drastic trade reform recommended if aggregate output is to decline not only in the short term but also in the long-term, and if the current account balance of payments deficit is to remain unchanged at 3 per cent of the GDP?

More detailed commentary on the Bank staff study is unnecessary. The danger—and a real danger that exists today—is that given our present precarious balance of payments situation, recourse to IMF assistance in the short run may force the country into adopting measures which may properly entrap us for a very long period. The very existence of the country would in fact be at stake.

We do need to liberate the Indian economy from the shackles of bureaucratic control which have gradually tightened since around the mid-seventies. But trade reform of the type recommended by the World Bank is certainly not the first step to this liberation.

STATE AND SOCIETY IN INDIA Studies in Nation-building

T. K. COOMMEN

Discussions on state and society invariably focus on the class character of the state and the nature of civil society as well as on the relationship between them. But rarely does one come across a conceptual analysis of the interrelationship between state and society in the context of nation building. This is important because, without exception, the terms society and nation/state are used synonymously and nation and state interchangeably.

This book, which presents a bold and refreshing analysis, characterizes the Indian polity as constituting a large number of nations and ethnicities. The deep attachment of each nation to its homeland, coupled with the underdeveloped state of the economy, gives rise to a distinction between insiders and outsiders—a rupture that is a major source of the tensions and conflict in independent India.

With its innovative conceptual analysis and bold policy formulations, this book will be invaluable for students of sociology, social anthropology, political science and public administration, as well as for policy makers, legislators and administrators.

Forgettable Anniversary

GPD

Within two years of the Tiananmen Square incidents, the whole episode looks so frightfully dated. Nobody is interested in it any more. The investors are not. The West is not. Japan has been more than keen to resume its role in China which it was forced, under American pressure, to suspend for a while.

THE second anniversary of the Tiananmen Square incidents went off quite uneventfully. The Chinese authorities are a little wary of anniversaries. So they did not look forward to seeing unpleasant things. In a society practising ancestor worship, which is really worship of the venerated dead, any government would be wary of anniversaries. Last month Amnesty International published a detailed list of people still languishing in Chinese gaols as a consequence of their participation in the protest demonstrations of June 3-4, 1989. It is difficult to think of other protest demonstrations in the world which were so large and (quite contrary to the belief of the CPC leadership) so uncertain of what they were supporting and demanding. The CPC leadership, of course, did not think so. What happened then is more than well known and hardly needs any recapitulation.

The net result has been that the anniversary of the Tiananmen incidents has made the Chinese leadership quite nervous. Somewhere the fear that death anniversaries always produce unpleasant consequences has been quite strong in the minds of those who rule China. It has been so ever since Zhou Enlai's first death anniversary way back in 1976. So the government of China decided to play it safe. Tiananmen Square remained closed to the public. No anniversaries, no flowers, no demonstrations was what the Chinese government had decided. There were, of course, references of the 'criminals' of the Tiananmen, counter-revolutionary criminals, that is. Anybody who can be certain of who those people in Tiananmen Square in June 1989 were has to be very bold indeed. Amnesty International is certain that these were "prisoners of conscience". The Chinese government is certain that they were counter-revolutionary criminals. Amnesty International talks of "hundreds of workers, students, intellectuals, Catholics, Protestants and Tibetans" who have been arrested since June 1989. But then organisations always have their peculiar and politically convenient categorisations. Chiang Kai-Shek was also a Christian, whether Catholic or Protestant is beside the point. But for a London-based

organisation it must be important to announce that 'Catholics and Protestants' have been arrested, they being (naturally) different from students and intellectuals.

Anyway, to each his own prejudices and preferences. The fact of the matter is that there are any number of Chinese people in gaol. The second anniversary of the Tiananmen Square incidents was marked by the fact that these people are still there, although quite a few 'students' have been released.

Normally the anniversary would have gone unnoticed. Asians being killed by their governments or by their own people does not attract attention any longer. It is simply a question of your preferences in killing. Some people don't like the state killing people, but think that people killing one another can be ignored because it is largely a function of state terrorism. Others think the opposite. Basically timid pen-pushers like us do not like these arguments, but what can we do? We have to live with violence and hope that it will not affect us.

It is, of course, fine that as Amnesty International points out, "trials in China do not meet international standards for fair trial" By international standards, it obviously means Euro-American standards. It might indeed be true that Asian trials generally do not meet "international standards for fair trials". There is no room for fairness in the Asian world. There has not been since the age of imperialism. Various ruling elites have simply replicated Euro-American standards for the coloured world in their respective worlds. This was seen quite vividly in the way in which South Korea's Roh Dae-wu the other day dealt with his students who had taken to the streets in anticipation of the anniversary of the Tiananmen Square incidents. The riot police went on a rampage in downtown Seoul. The Chinese authorities must be wondering why South Korean repression of their own students does not evoke as strong a moral indignation as the Tiananmen Square incidents do or did.

And this, they must ruefully think, in spite of their being now as open to the West and to the inflow of foreign capital as the South Koreans are. A part of the Chinese authorities' bitterness in their

condemnation of the perpetrators of the Tiananmen Square incident no doubt springs from what they must see as international double standards. This is not to say that Amnesty International is guilty of them. But a whole lot of other people and institutions are. And even Amnesty International is clearly in the wrong in thinking that in Deng's China Catholics and Protestants are detained *because* they are Catholics and Protestants. That simply is not true. The Chinese state, like the state in any other developing country, reacts essentially to any challenge to the hegemony of the ruling elite. And but for certain parts of Latin America where liberation theology has been a major force, the Catholic church has been a remarkably conformist and passive institution.

Anyway, within two years of the Tiananmen Square incidents, the whole episode looks so frightfully dated. Nobody is interested in it any longer. The investors are not. The West is not. Japan has been more than keen to resume its role in China which it was forced, under American pressure, to suspend for a while. But even that is an old story. There is little doubt that those who are in gaol in China will have to conform to the new political requirements. They will be released once they recognise that. Already the process is on as far as the students are concerned. In these very columns we had talked of a popular poet being helped by the PLA navy to migrate to Taiwan. There are no fair trials in China. But there are fair escapades; some engineered by the Chinese authorities themselves.

There has been some restriction on religious activity in China. Hence the Amnesty International's references to the Catholics and the Protestants. The world must look very different from London. But here in India we could do with some restriction on religious activity—whether Hindu or Islamic or Christian or Sikh or what have you. In backward societies these restrictions are important—one point which the much maligned Cultural Revolution was repeatedly making. It is no use mixing up religious rights with human rights, at least not in a backward society. So if the new regulations in China provide for that and if Li Peng's government has enforced these regulations, they should not be condemned. There is no escape from backwardness. And if there is no escape from backwardness, there is no escape from repression and, of course, from the Tiananmen Square incidents or their repetition. Any anniversary judgment on the Tiananmen Square incidents will have to recognise that.

Towards a Realignment of Social Forces

Ajit Roy

It is something of an irony that prospects, however vague, of the resuscitation of a Nehruvian perspective of development have opened up only with the fading away of the dynastic rule of the Nehru family.

EVEN while a section of the Congress(I) leadership is wistfully striving to stretch the Nehru Gandhi connection by seeking to draft Sonia Gandhi as its new helmsperson, obviously only a nominal one, everyone is conscious of the fact that Indian politics has entered a new phase with the death of Rajiv Gandhi. This awareness, naturally, has set the political parties to review their strategic orientations. Political pundits of various hues and statures in their turn have joined the game by peddling their pet theories.

Four or five variants of strategic plans have so far emerged to the fore. For instance, the Congress(I) and the BJP are still aiming at achieving the dominant role, but by striking a changed chord, the first by unleashing a sympathy wave as witnessed in 1984 in the wake of Indira Gandhi's assassination and the second by shifting its emphasis from the mandir-roti twins to a promise of 'stability' in the face of a likely loss of credibility of the same promise from the rudderless Congress(I). Then there are voices either demanding a national government, presumably including BJP representatives, or a Congress(I) Left joint front presumably excluding the Janata Dal. The Left parties are also engaged in a review of their position, vaguely aware that in the changed situation they may have to revise their tactics about the Congress(I). Indeed, insofar as Iyoti Basu's speech at a condolence meeting in Calcutta on May 26 is an indication, the CPI(M) may shift towards a more positive attitude to the Congress(I).

Although the Indian people and their political leaders have seldom betrayed signs of a lack of down-to-earth realism in their political judgment in the past, their present search for 'stability' mainly through the installation of a government with a stable majority at the Centre is certainly likely to prove chimerical. The BJP whose high pitch mandir campaign has been associated with bloody riots from one end of the country to the other, whose particular interpretation of 'Hindutva' by definition puts off the Muslims, Christians, Sikhs, Parsis, Adivasis, Dalits and so on, and whose demand for an instant and forced integration of the Kashmir valley can offer no prospects for assuaging the hurt and estranged Kashmiri people can never be a credible champion or instrument

of stability.

As for the Congress(I), if it failed to offer the much trumpeted stability with its nearly three fourths majority in the ninth Lok Sabha, how can it manage to do so with a slashed majority this time, if it gets a majority at all?

Moreover the Indian people and politicians should have in the meantime acquired enough historical experience to realise that real stability is a systemic function and that the assurance of a government majority in parliament is only one of its many dimensions. Attentive observers of the Indian scene should have also realised that the more basic factors tending to disturb the prevailing stability in the country are the struggles between the landless Dalits and the land holding middle class, the deprivations and alienation of the Adivasis, the rivalries among the backward castes themselves for vantage positions in the power structures and the regional disparities leading to widespread disaffection in the outlying parts of the country arising particularly from the limited lopsided and inequitable growth processes.

The promotion of sectarian parochial consciousness by all kinds of power hungry politicians competing for the retention and extension of their captive bases further compounds this situation.

In these circumstances, a firm parliamentary majority can itself become a factor for intensifying the destabilising pressures if this apparent stability is exploited to fortify the position of the ruling coteries, just as Rajiv Gandhi's regime had sought to do during most of its five year tenure. This process only intensifies the asymmetries and contradictions within the regime's social bases and between its social bases and the socio-political institutions standing thereupon. All the destabilising factors listed above were actually stimulated by the short sighted attempts at 'social and political engineering' initiated by Rajiv Gandhi in the early years of his rule.

The violence that is presently sweeping the country and is being widely bemoaned as symptoms of criminalisation of politics represents in essence the necessary norms of the destabilised politics of the day. Stable politics has been defined as a constant

process of bargaining and accommodation on the basis of accepted procedures. A certain level of violence is, of course, permissible under the norms of stability, some deviations from the norms are not, historically speaking, really abnormal, there may even be deliberate violations of the norms, but only sporadically. When deliberate violations of the 'norms' of violence become the rule, it indicates a fundamental breakdown of the so-called social contract, i.e., the social consensus, that provides legitimacy to the existing system, in other words, the hegemony and domination of the existing power bloc. This calls for a new consensus on the basis of a radical realignment of social forces. All the indications of the functioning—and non-functioning—of Indian polity today proclaim clearly and loudly that such a basic realignment has become due. But there precisely is the rub, so to say.

A basic shift in the existing correlation of forces in India today poses many intricate problems, for which no readymade answers are available. Firstly, in the context of the contemporary global developments, a direct option for a socialistically-oriented shift is hardly a realistic possibility even if one overlooks the question of maturity of the forces of production necessary for such a leap.

A more modest strategic objective, more in tune with the existing situation, is a broadbased social alliance for pushing forward a model for a democratic, egalitarian welfare oriented development of the sort which Jawaharlal Nehru had half-heartedly advocated but failed to achieve due to the self-contradictions in his own mind and in his operational plans besides the constraints and compulsions of the regime over which he presided installed by all round compromises.

It will however be naive and simplistic to think that successes in the strivings for pursuing a revised Nehruvian model of growth will be either easy or guaranteed. Not only the internal impediments remain as deeply embedded but the external environment has also become much more unfavourable due to the eclipse of the so-called socialist camp, significant weakening of the non-aligned movement and much more than a corresponding strengthening of the neo-colonialist forces—all this very much weakening the autonomy of the Indian economy as well as the Indian bourgeoisie.

Any success in this, the most appropriate under the circumstances, direction will demand the simultaneous operation and interaction of a number of factors and processes, such as

(i) The unity of action of a wide array of Leftist forces, party-based and non-party, and the combination of militant mass actions with a skilful use of parliamentary and other institutional forums.

geists-capitalist) growth, never failing to link these immediate and partial actions with the long-term objective of social transformation, in both material and cultural terms

(iii) Strengthening the linkage between the national struggles in India with all similar strivings in other parts of the world, including the actions of the radical forces in the developed, neo-colonialist, countries (iv) And, finally, an important part of this programme will be a sharper definition of the socialist perspective itself—from both the ends, i.e. deep going and critical studies of the capitalist dynamics and a renewal and enrichment of the conception of its socialist alternative on the basis of critical studies of capitalism as well as of the received theories and perceived practice of socialism

From this strategic conception, the immediate tactical tasks on the morrow of the 10th Lok Sabha elections will be

(i) to define a common platform of the Left forces for the purpose of isolating and weakening the medievalist disruptive BJP and similar forces, and

(ii) sifting to the extent possible principled elements from the entire range of the centrist bourgeois parties i.e. the Congress(I), Janata Dal and Samajwadi Janata Dal, for a broad Centre Left alliance based on a programme consistent to the extent possible, with the objectives noted above and excluding to the extent possible elements wedded to the 'Hindutvavadi' persuasions

In other words the main tactical task should be to isolate the BJP and its sympathisers on the one hand and to mobilise the bourgeois democratic elements as far as possible on a wide platform ideationally motivated by the Left

It is something of an irony of history that prospects, however vague have opened up for the resuscitation of a Nehruvian perspective of development in the country only with the fading away of the prospect of the dynastic rule of the Nehru family. The realisation of these prospects will, however continue to be retarded till the cynicism/sycophancy personal aggrandisement and similar legacies left by Nehru's family successors are purged from the political culture of the 'mother party and its proliferating offspring

Finally, it should be always borne in mind that this contemplated neo Nehruvian phase can only be a short period when radically oriented social forces will have to confront neo colonialist, inequalities and authoritarian forces for supremacy and a more permanent delineation of the social physiognomy. Indeed, with the growing intensification of contradictions within India and in the global environment, the multi class heterogeneous alliance can only be a short lived one. Hence, skilful permutations and combinations of MPs will be of much less importance than the mobilisation and unification of people in the fields and factories

Politics of 'Peaceful' Poll

Kamarupee

The self-congratulation in Assam over the peaceful conduct of the polls may not be entirely unjustified, but more important it is to note the ULFA's role in keeping the elections peaceful and the calculations underlying it.

THE elections to the 14 Lok Sabha seats and 124 of the 126 assembly seats in Assam passed off uneventfully, barring a few minor incidents. There was no polling for the Kokrajhar West (ST) assembly seat because the 'independent' candidate supported by the All Bodo Students' Union and the Bodo Peoples' Action Committee was declared elected unopposed after the other candidates in the fray were 'persuaded' to withdraw. The ABSU BPAC combine is leading the agitation for the creation of Bodoland, of which Kokrajhar area would be the very core, and is supporting selected 'independents', viewing the polls as a virtual referendum for the creation of Bodoland. Polling in Badarpur assembly constituency was countermanded following the death, due to natural causes, of the candidate of the Natun Asom Gana Parishad.

The few very minor incidents that marred the peaceful conduct of the polls, of which the most serious appears to be the incident of ballot box snatching by one of the former ministers in the AGP government in the Kamalpur assembly constituency, do not even deserve notice in the context of the norms for electoral conduct being set in other parts of the country. Naturally, there has been a lot of self congratulation in Assam over the peaceful conduct of the polls.

The self congratulations are not unjustified. There were indeed widespread apprehensions of violence before the polls, given the bitter conflicts that have been raging in the State between and among the various sections of the State's population, now apparently hopelessly divided along bitterly antagonistic caste/language/religion/ethnic divides—to take note of only the major divisions. These divisions have become especially sharp in the five years of AGP rule during which many of the State's indigenous minorities (who together would probably form a majority) had become totally alienated from the AGP government. The most visible evidence of this alienation has been the agitation for the constitution of a Bodoland as a separate State outside Assam being led by the ABSU BPAC combine, the agitation for the constitution of the two autonomous hill districts of the State into an autonomous State within Assam being led by the Autonomous State Demand Committee (ASDC), the agitation for a 'federal reorganisation' of the State according to a highly complicated scheme of autonomous

structures covering every segment of the State's population—this last being led by the United Reservation Movement Council of Assam (URMCA). Every one of these agitations viewed the State's politically and culturally dominant Assamese speaking people, especially that section which they derisively identified as forming an 'upper caste Hindu clique', with total hostility.

These new contentions, along with older and more inherent ones revolving around language and religion (the latter in a rather subdued manner) had so muddled the social and political atmosphere in the State during the years of AGP rule that apprehensions of a volatile situation during the election campaign and the poll were natural. Indeed, with the AGP itself splitting almost on the eve of the polls, adding another dimension to the existing divisions, such apprehensions were not unreasonable.

Above all was the most serious apprehension that the United Liberation Front of Asom (ULFA), the organisation committed to securing the 'liberation' of Asom from the clutches of India, would interfere in the election process either by disrupting the polls—after all, ULFA openly derided 'Indian democracy'—or involve itself in more mysterious ways to secure the election of candidates who in the organisation's calculation would be of assistance to the organisation. In this scenario, every kind of interference by the organisation, including intimidation of voters and candidates and enforced withdrawals (rather in the manner in which candidates in Kokrajhar West (ST) assembly constituency were 'persuaded' to withdraw), was envisaged.

And yet the election campaign and the poll have gone off with remarkably little fuss.

However, the real credit for the peaceful conduct of the polls appears to be due not so much to the peaceful disposition of the contestants and their supporters, nor to the deployment of a large number of paramilitary forces to augment the State's police forces (now acknowledged by the State's director general of police to have been inadequate and rather thinly spread) but to the strict way in which ULFA adhered to its declared policy of non involvement in the electoral process, on the ground that it did not believe in 'Indian democracy' and indeed did not subscribe to the concept of 'India' as a political entity.

tual purport of such a declared policy of non-interference, and whether the formal declaration was simply a cover for more subtle forms of intervention, ULFA remained steadfast to its declaration. At the same time since ULFA had refrained from calling upon 'the people to abstain from voting'—some in interventions by ULFA spokesmen in the local press actually urged the voters to take part if only to realise from actual experience the futility of taking part in the 'farce' of elections—it was clear that ULFA wanted the elections to be held while keeping itself formally away from the electoral process. The assurance of non involvement and refraining from a poll boycott call was clearly double-edged, for these also meant that no one else should disrupt, or in any way

kind of malpractices, the electoral process. This, and the implications of defying such stated policy and unstated directives, appear to have contributed rather more tellingly to the uneventful conduct of the polls in Assam than anything else.

This stand appears to be perfectly consistent with the organisation's larger objectives—affirming its lack of faith in 'Indian democracy'—and its immediately tactical requirement of ensuring the establishment of a relatively weak, regional party government or, even more preferably, a coalition government of regional parties, in the State, which alone will enable the organisation to resume its activities and regroup its scattered personnel in a post-Operation Bajrang scenario.

bringing imports forward and delaying repatriation of export proceeds. This was further compounded by the cessation of accretion to the non-resident deposit accounts as a result of the Gulf crisis and perhaps the impairment of confidence in the economy.

A number of general observations could be made about the problems and prospects of balance of payments. The deterioration of the trade deficit could be attributed in large part to factors within the domestic economy. First and foremost, the economy has been unable to adjust its structure to changing domestic and international economic conditions. Investment in the productive sectors of the economy has not been at the required pace.

A low level of investment has implied low rate of technological progress, for new investment incorporates new technology. The resultant low productivity, widening technological gap, low degree of specialisation of many firms, and production of goods which face declining domestic and foreign demand have led to the erosion of India's competitiveness. Further, government policies have contributed to the creation of an economic environment that has indeed aggravated the trade imbalances. Large and growing government deficits geared to consumption have given rise to high liquidity. In spite of the lacklustre economic growth, the country has been resorting to extensive borrowing, in particular short term borrowings. As a result there has been an accumulation of external public debt, the servicing of which has imposed a considerable burden on the country. Thus, coupled with sharp fluctuation in already insufficient visible receipts and inflow of private capital, created a desperate situation where the government has been driven to fall back on the last resort of selling its gold stock to pay its debt.

Such sale however does not provide a lasting solution. What next, after all the available gold stock has been pledged? Balance of payments instability has become a chronic problem. External payments prospects are bleak. Domestic macro economic imbalances are worsening. Inflationary pressure is building up. Monetary policy is tight and production repressed. The international economic environment is far from favourable. The growth rate has considerably slowed down in the industrial countries. Conditions in the world money and capital markets are not encouraging. There is a certain degree of uncertainty regarding the country's ability to raise capital through borrowing following the sharp downgrading of the country's credit rating. Above all, there is no economic administration worth the name in the country. This ominous situation calls for rethinking of policies and crying a halt to the economic liberalisation. There is need to study and draw lessons from the experience of a country like Pakistan which has recently gone the whole hog with the policy of economic liberalisation.

Gold Sale: Symptom, Not the Malady

The government's decision to 'pledge' 20 tonnes of confiscated gold abroad, which has attracted widespread criticism, is but a symptom of the country's external economic crisis which calls for review and reversal of the policy of economic liberalisation.

STANDARD AND POOR, the internationally reputed credit rating agency, was the first to break the news that India had sold gold in Zurich on May 30 to cope with the foreign exchange crunch and consequently it has lowered India's debt ratings to BB+ for long term senior debt. It was the second such downgrading in less than a year. As further speculative reports concerning gold sale surfaced, the government of India hesitatingly confirmed that India had, for the first time, sold 20 tonnes of confiscated gold to raise \$ 200 million (Rs 400 crore) with repurchase provisions to deal with the balance of payments crisis. The gold had been sold through the State Bank of India purely on a lease basis for a period of six months. The foreign exchange procured through the gold sale would carry a flat LIBOR rate of 6.3 per cent. Reportedly the swapping was done after the confiscated gold was shipped overseas for an internationally accepted mint mark certifying good delivery quality, which became necessary as the Indian mint did not figure in the 32 recognised mints worldwide.

An act as desperate as the sale of gold (which even seemed to have affected the election prospects of ruling government) had to be resorted to in order to raise resources to meet the anticipated foreign exchange gap of around \$ 700 million for June. Speculation is that the country may be forced to pledge further amounts of gold to avoid the disgrace of defaulting on debt servicing obligations. There have also been reports that the Reserve Bank of India might use its own monetary gold (kept as reserve for currency issue) for raising resources through leasing. The RBI indeed does enjoy the statutory sanction for selling or swapping

15 per cent of the official gold reserves.

The gold pledge has proved very controversial. The prime minister himself took pains to explain the rationale of using the gold for raising foreign exchange resources. He explained that the 20 tonnes of gold had been mortgaged and not "sold in order to manage a difficult market situation". The RBI governor was the competent authority to take a decision in this regard, but the decision had been ratified by the government. The prime minister added that if the required foreign exchange had not been raised by pledging gold, the country's credibility and creditworthiness would have been seriously impaired.

There has been criticism of the government's decision to convert a non liquid asset viz gold stocks, into more liquid floating foreign currency assets from different quarters. Also there has been support for the government's action. Most of the critical comments have focused on the ethical aspects, the propriety and the timing of the decision and have failed to address the underlying basic issues. To stress the obvious, the need for the sale has arisen because of the large and widening external payments deficit, in particular the trade deficit. The increase in the trade deficit is in part ascribable to the oil price rise which followed the Gulf crisis. But even excluding the effect of high oil prices, the trade deficit widened markedly to about Rs 16,000 crore, reflecting basically the impact of the policy of liberalisation pursued in the past five years or so. This got reflected in the surge in the non oil import bill. The deterioration of the balance of payments gathered momentum after July 1990. The expectation of an acceleration in inflation and creeping

Terms of Political Discourse in India

T V Sathyamurthy

Discussion at the second conference of the project 'Terms of Political Discourse in India' focused on the themes of State and Social Oppression; India's Economic Policy in the International Context; Politics of Agrarian Transformation; Structure, Discourse and Political Institutions; State, Nation and Class; and Resistance, Co-option and Cultural Transformation.

THE second conference (Bhubaneswar September 20-23, 1990) of the project 'Terms of Political Discourse in India' was essentially designed to enable the contributors of papers to comment critically on each other's work prior to undertaking the production of final drafts, and to discuss the main themes of the projected volumes with the aim of ensuring a degree of coherence in the work as a whole. Like the first conference (T V Sathyamurthy, 'Terms of Political Discourse in India', *EPW*, July 7, 1990) the Bhubaneswar conference also reflected the wide range of issues falling within the scope of the project, if anything with sharper focus.

The conference was divided into workshops around the following six themes: (1) State and Social Oppression: Identity and Resistance; (2) India's Economic Policy in the International Context; (3) Politics of Agrarian Transformation; (4) Structure, Discourse and Political Institutions; (5) State, Nation and Class in India; and (6) Resistance, Co-option and Cultural Transformation. It was hoped that, in these groups, areas of agreement as well as of disagreement between contributors could be fully explored.

State and Social Oppression: Identity and Resistance

The papers grouped together under this rubric were: Ilina Sen, 'Aspects of the Women's Movement and Political Action in India'; Sudhir Chandra, 'Understanding Hindu-Muslim Relations: A Note on Two Hindi Novels'; V Suresh, 'The Dalit Movement in India', and an abstract of a paper on 'Fourth World Realities and the Distortions of the Dominant Discourse: The Case of the Indigenous People of Orissa' by R K Nayak.

Sen's paper provided a broad historical overview of the women's movement in its most recent phase and included some of the theoretical issues relating to specific features of its elaboration in the Indian socio-political and economic context. The discussion focused on women's position within 'general' movements, the tensions between men and women in common political action (e.g., over land- and forest-based issues), the question of women and the media in relation to the market and

patriarchal values, the integration of the position of women in the family with their specific class/caste positions, the meaning and role of 'equality' in women's struggles, and how the relatively equal status of women, say, among certain Adivasi communities can be maintained under conditions of change.

A number of participants raised questions on Sudhir Chandra's paper relating to the applicability of concepts valid at a micro level to the sub-continental level, the costs that non-dominant (i.e., minority) cultures were required to bear as a consequence of the dominant culture providing the paradigm of homogeneity for the society as a whole, and the structuring of various identities (i.e., the different communal identities as well as other socio-political and economic identities) in a hierarchy and not simply as co-existent ones.

The discussion of Suresh's paper on the Dalit Movement touched on the reasons for the increase in atrocities against Dalits. Two alternative hypotheses were put forward: a decline in the sense of community and the failure of the state to intervene at the local level in order to guarantee civil rights; and the Dalits' refusal to accept their ascribed position and organising themselves successfully to resist upper caste domination. Another question to surface reflected upon the problems involved in mobilising Dalits as a united force because they were now active in different spheres and members of different classes to some extent.

The contradiction between those among the Dalits who are agricultural labourers and those who have developed urban or non-agricultural links was highlighted. Dalit women's experience of struggling against sexual violence at the hands of upper or higher caste men was also discussed with special reference to the accusation levelled against them that they were 'in league' with upper caste women.

The author was questioned as to why there was no reference in his paper to the Bahujan Samaj Party and to the Satnami movement in Chattisgarh. Another strand of the discussion related to the distinction between reformist movements (aimed at

changing the position of the Dalits within the caste order) and revolutionary overthrow of the caste order itself. It was suggested that the policies developed by the existing state could contribute a material basis for a 'humanistic ideology'.

R K Nayak's abstract elicited discussion of the diversity of experiences within the category of Adivasis, varying from the Adivasi population fragmented in central India between a number of States, to territorially homogeneous Adivasi communities with sharply developed sense of national identities. A number of participants were interested to know whether there was any role for surviving elements of collectivism in the future of the Adivasi communities.

Resistance, Co-option and Cultural Transformation

S V Rajadurai and V Geetha's paper on 'DMK Hegemony: The Cultural Limits to Political Consensus' gave rise to a discussion of the question of the 'Tamil nation'. Some felt that the criticism of the DMK's 'compromise' put forward in the paper was premised on the assumption that a Tamil nation was in fact in existence as an ideological construct if not as a political reality. It was suggested that the Tamil question could not be analysed separately from questions of the nation state and of markets. Tamil nationalism could only be understood if India were regarded as a collection of nations, rather than as a single nation. Attention was also given to the Tamil national struggle in Sri Lanka and its class basis. The authors felt that the DMK ideology could be regarded as providing the inspiration; it also made a dynamic input into Tamil culture.

The question of how the appropriation of dissent described in Sumi Krishna's paper (entitled 'The Appropriation of Dissent: The State vis-a-vis People's Movements') fitted into a larger structure of state and civil society was considered. It was suggested that the paper could throw light on the differing relations of different movements to the state in terms of the nature of the demands made on the state.

India's Economic Policy in International Context

The following papers were discussed under this rubric: A K Bagchi's 'The Discourse of Political Economy in Post Colonial India: A Fractured Consensus or a Vanishing Facade?'; Pramit Chaudhuri's 'Economic Planning in India'; Krishna Bharadwaj's 'Regional Differentiation in India'; T V Sathyamurthy's 'India's International Role: Economic Dependence and Non-Alignment'; Sanjaya Baru's 'India's Industrial Policy'; F Sridharan's 'Liberalisation, Self-Reliance and Technology Policy in India in the 80s: A Shift in Terms of Discourse?'; and Suman

Nair's 'India's Population Policy'.

The discussion on Bagchi's paper centred round the failure to create the conditions for capitalist development since independence through the adoption of 'economic nationalist' policies including agrarian transformation, the role of the left in India, the tension between building socialism and promoting capitalism by demanding more stringent economic nationalism and the enforcement of 'bourgeois laws' disciplining capital, the contradictions engendered in the development pattern (e.g., the Punjab), the role of the political coalition including the rich and middle peasant classes, the problems posed by India's specific 'class-caste' context for fostering economic nationalism in an effective manner, and the nexus between market-sharing between regional capitalists and economic nationalism.

Chaudhuri's paper was followed by a discussion of different strategies of growth and the distinction between a 'support-led strategy' and a 'growth-led strategy'. It was suggested that the role of the state should be re-defined to enable a better redistribution of the surplus whilst mobilising to advantage the resources that the poor already have. It was stressed that such policy changes could only be effective if they were underpinned by structural change such as land reform and legal changes strengthening economic nationalism. There was some discussion of the process of planning itself as a strategic instrument serving certain class interests whose nature has changed over time. A distinction must be made between the impact of planning on high, middle and low income groups on the one hand and 'the poor' on the other. The main conclusion of the paper remained that planning had not affected poverty.

Krishna Bharadwaj's paper evoked comments pointing out the need to include some discussion of the regionally uneven role of nationalised banks and their policy of transferring resources to advanced industrial areas. Several questions were raised, among which the following were central: were Gujarat and Maharashtra, say, in fact well placed in agriculture at the beginning (in the 50s say)?; was the State Domestic Product (SDP) a good measure of the differential performance of the States?; was the relationship between growth and poverty implied in the paper valid?; what was the role of factors such as the nature of extraction of surplus by trading-finance capital and of markets in explaining the pattern of backwardness?

The discussion following Sathya-murthy's paper touched, among others, on the following controversial points: had the paper not exaggerated the role of foreign capital (especially foreign direct

capital) and over-estimated the extent of India's satellisation; was there a congruence between the set of issues raised in the paper—viz, hegemony, liberalisation and dependence—and certain important events—viz, Bangladesh war (1971), FERA (1973), the first liberalisation budget (1975-76), and the IMF loan (1982)?; how should the responsiveness or the lack thereof towards the poor as witnessed by expenditure allocation be evaluated?

The main issues raised in response to Sanjaya Baru's paper hinged on whether the 'breakdown of consensus' hypothesis (referring to the broad consensus in the country on the industrial strategy to be followed during the first 20 to 25 years of independence) would bear closer examination without further data (e.g., a statistical profile of the different groups and sectors in the economy and their import intensity), whether the paper did or did not understate the role of international capital, and whether the paper underestimated the nature of restructuring under way in the Indian economy.

Criticisms of Sridharan's paper revolved round the contention that it contained no references to the alternative discourse. According to a number of participants self-reliance had never been defined as autarky. The implied simple assumption in the paper that allowing more technology import would solve the problem was also attacked. Some suggested that technology should be approached in a more disaggregative manner than in the paper. One criticism related to the absence in it of an explanation why indigenous technological capabilities did not develop earlier on.

The two main comments on Sumati Nair's paper hinged on the need for a more sophisticated critique of Malthus and the importance of the relationship between political crisis and shifts in population control. Another point related to decisions concerning the use which women made of their bodies. These should be increasingly made directly by women themselves and not allowed to remain surrogate decisions taken on their behalf by men.

Politics of Agrarian Transformation

This workshop consisted of papers by Ravi Srivastava ('Some Recent Trends in the Pattern of India's Uneven Development and Implications for Political Processes'), Dev Nathan ('Agricultural Labour and Poor Peasant Movement in Bihar: Nature of Resistance and Problems of Strategy'), Sucha Singh Gill ('Agrarian Capitalism and Political Processes in the Punjab'), and R. Vidyasagar ('New Agrarianism and Challenges for the Left').

Srivastava's paper led to a discussion of the dynamism in hitherto 'backward'

areas, while new classes were struggling with political implications related to their caste bases. It was suggested that even uneven development should be studied in a national context for the reason that the success of 'backward' class movements depended on the extent to which they related to national issues. A discussion of the implications of the rise across regions of the rural real wage rates differentiated between advanced areas where the impetus for rural wage increases came from rising demand and backward areas where the stimulus was provided by migration. However, this was not consistent with conditions of overall 'surplus' labour.

Dev Nathan's paper gave rise to a discussion of the different forms of agrarian transformation and of the significance of the group emerging as capitalist farmers from the lower castes (Kurmis, Yadavs and Keoris). Some discussion also focused on the impact of different types of agrarian change on women's position.

Sucha Singh Gill's paper was followed by a discussion of the present political and economic situation in Punjab. Protest movements in the State were not being articulated by the labouring classes but by the emerging agrarian bourgeoisie from whom the Shiromani Akali Dal drew its main political support. The rural bourgeois elements also tended to take over more and more elected offices in the local administration at the level of the district and below, as well as leading 'farmers' movements' and 'kisan movements'. It was pointed out that differentiation was taking place in several

sectoral composition.

The discussion of Vidyasagar's paper centred round the failure of the Left to mobilise the rural proletariat in the past which was linked to their emphasis on building an alliance against the landlord class. There were also some comments on the role of the CPI(ML) parties, and in particular the Indian People's Front (IPF) in the areas in which they were active.

Structure, Discourse and Political Institutions

The papers discussed in this workshop were: Rajni Kothari's 'Fragments of a Discourse: Towards Conceptualisation'; Subrata Mitra's 'Modernisation, Endogenous Culture and Revolution: 'Western' Paradigms of Indian Politics'; Satish Saberwal's 'Democratic Political Structures'; Kalpana Wilson's 'The Post-Independence State in Marxist Writing'; Dhirubhai Sheth's 'The Great Language Debate: Changing Terms of Discourse'; Sudipta Kaviraj's 'On the Structure of Nationalist Discourse'; Suranjan Das's 'The Indian National Congress: Aspects of Continuity and Change'; and Javed Alam's 'Nation: Discourse and Intervention by the Communists in India'.

The discussion that followed Kothari's paper drew attention to the questions of distinguishing between 'discourse' and 'non-discourse', distinguishing between following some form of logical order and adopting inter-locking discourses, and of the absence of reference points (implied in vertical segmentation in discourse). Did discourse mean 'contingent utterances' or 'a range of utterances possible' or 'conceptual common sense'? Discussion also centred round the tendency to regard the state as the only agency that can change society, the precise point in time when the post-colonial state was first challenged in India (by the Maoists in 1966?), the hiatus in the paper originating in a possible lack of sense of proportion in Kothari's appreciation of orders of magnitude and, most interestingly, the difference between Nehru's and Gandhi's position concerning the relationship between state and society in discourse-analytic terms and the advantage enjoyed by the former over the latter who did not have a clearly worked out model.

A main point to emerge in the discussion of Mitra's paper was the intellectual slavery of much of Indian political science to categories and concepts handed down by Western political science, and its servitude to existing terms of reference. There was some controversy over Mitra's treatment of specific authors such as Francine Frankel and Atul Kohli.

Among the wide range of comments that Saberwal's paper attracted, the most persistent one related to whether there was

symbols. There was an implicit assumption that Western paradigms and classificatory schemes were universally applicable, especially at the level of understanding of emancipatory action. One of the participants pointed out that, over and above the segments and fractions of society, there was a range of expectations and underlying divisions which were human, emancipating, liberating, etc. and, as such, frameworks of understandings and actions that were not bound by cultural presuppositions could be conceptualised. Another point made was that, in order to produce the translation of ideas and experience into workable ideologies, and set in motion the creative process of constructing ideology, a high level of institutionalised organisation was needed. On the other side, 'bhaichara' applied its tradition of control over force to perpetuate mayhem. In order to operate legislative (i.e., democratic, institutionalised) structures at the State level, participants ought to be willing to work to norms and disciplines and not create artificial majorities by buying and selling legislators (a canker that could well spread to the Centre).

Wilson's paper stimulated several interesting contributions. It was pointed out that there was no crystallised version of the major political trends in India in academic writings. Marxist contributions on the Indian state were important and should not be belittled. The question of the character of the Indian state was closely linked to the assessment of the character of the bourgeoisie (is it a collaborationist or an oppositionist ruling class?). The actual understanding of the communist movement in respect of this question has varied from one to the other. It was pointed out that the author's remit was restricted to academic Marxist writings on Indian politics and did not extend to inner party controversies. After a period of stagnation (the 60s and the 70s), Marxist and party intellectuals were feeling much more relaxed and secure about advancing reassessments of the strategy and tactics of the communist movement, and self-censorship was definitely on the wane.

Among the responses evoked by Sheth's paper were: (1) the distinction in the paper between two levels of discourse—the existential and transcendental—and the shifts in these due to changes in social reality (especially in contested areas of change); and (2) the dimension of minority rights which involved the questions of identities and equality as reflected in the way in which the relationship of symbolic contestations in different representations of reality related to each other. Some interest was aroused on the

firmative action in the safeguarding of minority rights, the Constitution being cited as an example of this by counterposing abstract issues of equality in the form of individual rights versus group rights. In a number of States, effective political power had passed from higher to lower castes. Yet, paradoxically, this did not affect the position of a vast majority of individuals belonging to lower castes. Another question that came up for discussion was the change in the role of English in the education of the regional elites. The impact of the market on the state and its contribution to the speed of dissemination of English was also discussed. The phenomenon of metropolitanisation and the competing position of the English and Hindi educated segments of the elite were also commented upon.

Kaviraj's paper stimulated an energetic discussion. A point was raised about the dominant language. From Gujarat to Assam there was a linguistic continuum, and in every region rural people were bilingual or multilingual due to the overlap and variation of dialects from area to area. The term 'composite culture' featured in the discussion next. Was it something that the likes of Nehru had or was it the feature of villages in which the Moharram procession started from the courtyard of the Hindu temple and the Durga image was taken right up to the mosque before it was taken out for the immersion ceremony? Composite culture of the latter kind should be distinguished from the hybrid Anglo-Indian or Indo-Anglian culture of the elites. Discussion was also extended to include the question of Hindu versus all-India nationalism and Jinnah's brand of Muslim nationalism. In order to address the question of nationalism adequately it would be necessary to comprehend its many-layered character analytically. The process of enumeration was crucial to nationalism as also the notion of being bounded by an area. When national identity was enumerated, all other identities also would be enumerated. Another point of view denied the validity of 'composite culture' and argued in favour of 'multiple identifications' instead. This was further refined to refer to a 'hierarchy of multiple identities'. Secularism could only be made sense of in the concrete, not on the basis of abstract formulations. European categories could not be extended to India any more than class categories could be mechanically employed to solve all problems.

Das's paper attracted a good deal of debate. Some sympathy was expressed with the way the story was told in the paper by putting together (a methodological point) discrete colligated events

same class or type. A part of the discussion bore on the problematic relationship between Nehru and the CPI, especially the former's tendency to mete out punishment to the latter whenever it transgressed the parameters of the Congress system. It was also pointed out that the rough and tumble of electoral politics stood in flat contradiction to the paper's assumption that the desirability of socialism was taken by the Congress (axiomatically) as a moral imperative for action.

Alam's paper touched on the discourse involved in this general area, its analysis and critical proposition. The question was raised as to who defined the limits of what was being talked about within other sets of boundaries. The discussion then moved on to a consideration of the specific modalities of nationalism— from a lexical understanding of the word 'nationalism' to the 'national question' in Lenin's polemic on the subject, to Gandhi's view, according to which the Indian nation had existed before the arrival of the Muslim rulers and therefore could not cease to exist after their coming. Indian nationalism appeared in three analytically separable layers—structural, theoretical and the final demand in the 40s for Pakistan.

The discussion then focused on inner party controversies within the CPI. There was a strong tussle within the CPI on the two streams of nationalism (the alternative line being espoused in an 800-page report in two volumes by Adhikari, entitled *Hindu Muslim Unity and the Freedom Struggle*) in relation to the Pakistan question. The question was also raised as to whether the motivating factor behind the CPI's line on the multinational character of India was opportunism or a lack of proper grasp of Marxism. Also, it was asked, what was the underlying logic of the CPI urging the Sikhs to join Pakistan, when in fact there was a profoundly antagonistic contradiction between the Sikhs and the Muslim League. In spite of India being a multilingual state, and the States' Reorganisation Commission's suggestion that the main or overriding criterion for the reorganisation of States should be the language of the majority, the government insisted that the Punjab (unlike the southern and western States) should continue as a bilingual state.

An interesting discussion followed on the question of why the Marxists and communists subsequently removed the 'national question' from the agenda. It touched on the evolution of Indian and international communist thinking on the question as it ramified itself during the period 1942-46. The great political error lay in the mechanistic acceptance by the

FORM IV-A (See Rule 4A (1))

NOTICE

1 It is hereby notified for the information of the public that Greaves Cotton & Company Limited proposes to make an application to Central Government in the Department of Company Affairs, New Delhi under Sub-section (4) of Section 23 of the Monopolies and Restrictive Trade Practices Act, 1969 for approval to the take-over of Auto Division of Brooke Bond India Limited. Brief particulars of the proposal are as under: i Name and address of the applicant: Greaves Cotton & Co Ltd, 1, Dr V B Gandhi Marg, Bombay-400 023 ii Name and address of the undertaking the whole or part of which is proposed to be taken over and the manner of acquisition of shares, acquisition of control or management, whether by the acquisition of the ownership of the undertaking or under any mortgage, lease or licence or under any agreement or other arrangement: Auto Division of Brooke Bond India Limited. By purchase for cash consideration iii Management structure of the applicant: The applicant is managed by the Managing Director subject to the superintendence, control and direction of the Board of Directors of the Company iv a Capital structure of the applicant:

Authorised Capital (as per Balance Sheet as at 31.3.90)

K. SITARAMAN
SECRETARY

Dated this 11th day of June 1991

with the 'national question' had not yet been overcome by all three communist parties. Conceding the right of every nationality to secede, the writings of Namboodiripad and Sundarayya on the 'national question' (as well as the Note of the Madurai Congress on the 'National Question') still continued to remain a part of the CPI's thinking even in the 60s (e.g., Adhikari's pamphlet on *Sikh Homeland*).

The main interest of the concluding

be covered in the volumes to come out of the project. These included, among others, the emergence of the BJP as a powerful force attempting to mobilise 'Hindutva' politically through the Ayodhya issue; the strategy of the Janata Dal to mobilise political support on the basis of its stand on the issue of reservations; (Mandal Commission recommendations); and the systematic violation of human rights by the state and other groups as well as the resistance to it.

Fall-Out of Gulf War

Changed US-Europe Relations and Third World

GN

In the post-Gulf war international balance with a vastly enhanced role for the US, the Third World will be confronted by the closely concerted pressures of the US and Europe in the political, economic and military spheres with no countervailing force anywhere in sight.

IN 1941, Henry Luce, the publisher of *Time*, decided that the era then ending should be known as 'the American century'. Forty years later, the president of the US declared before the US Congress that "among the nations of the world only the US has had both the moral standing and the means to back it up". This he felt would bring the US and the world to the "next American century". When the US defence secretary, Dick Cheney, claimed (February 5) that "USA is the leading power in the world" and that "we have special obligations because of not only our capabilities but also because of our moral standing" he was giving expression to the US establishment's self-assessment.

The US stands to gain the most from the new arrangement in West Asia. The chairman of the joint chiefs of staff has declared that the US has "always been anxious to have a forward headquarters [of the central command] in the region [Middle East], and I think we may be able to get one this time". Indeed long before this the US defence secretary had asserted that the US naval presence in the Gulf region would be 'significantly enhanced' and added that "there are other steps we could take to maintain a significant presence out there without having large US forces on the ground". This military arrangement means that the US can dominate and control a region with 85 per cent of known world oil reserves. Seventy per cent of western Europe's oil supplies and 90 per cent of Japan's oil requirements are met from the Persian Gulf.

This region is also vital as a market, including for armaments. Kuwait's reconstruction cost will be at least 100 billion dollars. Britain and the US already have arms agreements with Saudi Arabia which are worth 20 and 21 billion dollars, respectively. Japan was by far the largest financier of the Gulf war after the Saudis and the Kuwaitis with their commitment of \$ 13 bn and Germany contributed \$ 7 bn. But out of 171 contracts for the reconstruction of Kuwait 70 per cent went to the US and 22 per cent to Britain.

The other objective of establishing US global pre-eminence is contained in Bush's call for a 'new world order'. This is vital for the US since the post-cold war world was described by the US as a multi-polar system. Not any more. The global partnership has been replaced by American leadership. More importantly, in the post-Gulf war scenario the dividing line between those who can act militarily and those who cannot has once more become important. Neither Germany nor Japan has a credible military presence. No wonder Bush called the war the 'defining moment'—the US would now stand a better chance of establishing its leadership over rivals as much as reluctant allies. This is where the evolution of US relations with Europe becomes significant.

US-EUROPEAN RELATIONS

In early 1990 it looked as if the US would be sidelined by the swiftly changing scenario in Europe with the demise of

pean client state of the US, Britain, appeared confined to the margin in European moves towards political union. When the crisis erupted in the Persian Gulf the European response was hesitant. It was under US pressures that support for war efforts gradually emerged. While France was late in coming round to accepting the US diktat, Germany maintained a low profile by using the argument of its post-war Constitution which banned deployment of troops abroad. Significantly, the European response was not in the shape of a commonly worked out stance expressed through the European Community (EC). It was, instead, found necessary to show Europe's collective support for US war preparations against Iraq by reviving the Western European Union (WEU) which had been in limbo since 1949 when NATO was formed. By reactivating WEU which was given charge of the common command operating from Paris, the US succeeded in bouncing back into the ongoing moves for a common security policy for Europe 1992. When the British prime minister, therefore, contended that "considerable disparity" existed within the 12-nation EC and that this indicated that "Europe was not yet ready for political union or common foreign policy", he was not just speaking for Britain which is a third rate power, but putting across the claims of the US. US pressures have paid dividends insofar as the agenda of debate now revolves around WEU and its role as a link with NATO on the one hand and EC on the other.

In what was a fall-out of the US military victory over Iraq and the successful projection of US power, the US state department in a memorandum to 11 EC members (Ireland, the twelfth member, is neutral) warned those who were proposing a defence role for EC. According to *The Independent* (London, March 6, 1991), the US laid down three demands for preserving NATO: avoid creating an internal caucus of European states within NATO; avoid undermining NATO's doctrine of common response; and avoid enfeebling the command structure of NATO.

Now it is true that the US has supported European involvement outside, although it is hardly elated at the prospect of an Europe outside its control. At a meeting of NATO foreign ministers at the end of December last James Baker in fact asserted that US supports "an enhanced European security and defence role, provided it is supportive of the Atlantic Alliance".

Interestingly, WEU and its standing armaments committee work in conjunction with NATO and are, for all practical pur-

"OUR MOTTO - CUSTOMER SATISFACTION"

posed, subordinated to it. Hence the significance of the US pushing for WEU's revitalisation. Manfred Wörner, general secretary of NATO, was quite categorical when he said "WEU cannot be anything more than an integrated part of NATO... an instrument for European action outside NATO's territory, as in the Persian Gulf".

The US, therefore, pushed for Europe to revive WEU, whose charter is compatible with NATO's, while permitting it to act outside the NATO area in conjunction with the US. This would enable the US also to press Europe to share the economic burden even as the latter moves away from its obsession with the Soviet Union. Manfred Wörner says that NATO does not need an 'enemy' to survive. "In an age when we cannot precisely quantify future risks, NATO's collective security is by far the most sensible insurance policy against every kind of uncertainty." The implication here is that the trans-Atlantic alliance is an insurance against an 'uncertain' future.

As it happens, one of the uncertainties is posed by the Third World which is not an ideological, political or commercial threat but is a potential threat all the same, with the sheer size of its population and prone as it is to messianic anti-Western movements. The Third World is the new factor in all these calculations. Significant in this connection is the statement by NATO on April 6, condemning Iraq's repression of Kurds. In an unusual move a specially convened NATO meeting called for bringing 'every pressure' on the Iraqi regime. Obviously NATO is expanding its geographical reach in conjunction with WEU.

The debate on WEU and its usefulness has always focused on its broader objective of enabling Europe to intervene militarily outside Europe. In this sense not only does the US get round the problem of independent European defence but also ensures its position within by associating Europe in its global objectives. These moves also mean the subsumption of the UN under the US-Europe axis since NATO and WEU are moving towards arrogating to themselves the task of global policing. (The creation of 'safe havens' inside Iraqi territory by the US, backed by Britain and France, which the UN secretary general and other officials have opposed, shows the threat posed to international order by the US-Europe combine.) European countries such as France, Germany, Holland, etc. are in the forefront of a concerted campaign to change the UN Charter which would dilute the Third World's sovereignty and enable outside interference in any country's internal affairs. Of course, all this is under the

hyperbole of halting human rights violations. But, bereft of frills, this is simply an attempt by Europe and the US to usurp the right to define international order and enforce international law. What is more, these countries are scathingly critical of the UN Charter's supposed 'limitations', i.e. it does not permit outside interference. Hence the resolution moved by Britain backed by US and France for a UN-administered 'safe haven' inside Iraq for Kurds. Thus would a minority of five members of the Security Council subvert the UN Charter and dictate terms to UN's 159 members.

Simultaneously, the US has also been leading efforts to (a) formulate a common policy for exporting weapons to non-NATO nations, especially in the unstable areas of the Third World; it was with this in mind that the US ambassador to NATO, William Taft, proposed on March 15, 1990 that an international board to monitor defence trade be formed along the lines of GATT which regulates civilian trade; and (b) open up Western defence trade and the European side of the market by removing obstacles in the shape of 'technical standards for equipment' so as to allow 'international teaming up by the defence industry'. While the likelihood of a 'defence GATT' appears distant, the offer represents a US desire to push for 'trans-Atlantic co-operation' with cartel-building to control the weapons market. There is the likelihood of a comprehensive move to control the movement of defence technology to the Third World. This was earlier done through the Missile Technology Control Regime, an agreement among supplier countries not to sell missiles having a range of over 300 kms. There is now a move to impose regional non-proliferation regimes for non-nuclear weapons. Possibly out of fear of being sidelined by US moves for regional non-proliferation regimes supervised by US allies, Japan is using its economic muscle. Hence the reported Japanese moves to link its aid to India and Pakistan with their signing of NPT. Also, Germany is taking the strident line now against Iraq to compensate for the diplomatic loss suffered because of its low profile during the war. What is ominous is that in the escalating stridency the victims are inevitably the Third World.

While trans-Atlantic differences have increased over the years, the Persian Gulf war has helped restore the international balance of power in favour of the US. For instance, in Europe Germany's role has suffered and Japan is being shut out from West Asia. The US can now tap the anti-Japanese and anti-German sentiments and wield these as a bargaining stick. The US analysts were aware of the constitu-

tional composition operating in the case of Japan and Germany and their military participation could not have helped the US materially or politically. On the contrary, it could have obstructed getting the support of the Soviet Union and China in the UN Security Council. Furthermore, the EC has quietly dropped its proposal for a solution to the Arab-Israeli conflict through a UN peace conference by requesting the US to allow its participation in a regional conference. Nor is it pushing for a conference on security and co-operation for the Mediterranean and the Middle-East.

The post-cold war balance with an enhanced role for the US, therefore, helps in the short run to put the brakes on the emergence of an independent security policy for Europe. This implies that the Third World will face the combined weight of trans-Atlantic enterprise in both civilian and military trade. Immediately there will be greater pressure on the Third World to compromise on intellectual property rights, terms of trade, foreign policy, security policy, etc. Third World countries will have to confront a regime of non-proliferation of nuclear and non-nuclear armaments at the regional level aimed at disarming recalcitrant members of the Third World and co-opting as local clients those willing to toe the imperialist line. And in confronting the combined might of the US and Europe there will be no countervailing force available to them. It is this prospect that must inform any debate in India about the fall-out of the Gulf war.

Invaluable book for Metropolitan Development Authorities and Town Planners

PLANNING FOR METROPOLITAN CITIES A Suggestive Approach

by
M. Pratap Rao

Rs. 120

It studies the important problems of metropolitan growth and new town attempts made around the metropolitan cities with special reference to India.

Data System for Khadi and Village Industries

An Evaluation

T R Bishnoi

The currently available data on khadi and village industries are quite inadequate and fail to provide a useful profile of village industries. This is partly due to the inappropriate data system in use.

THE objective of the Khadi and Village Industries Commission (KVIC) is to revive village craftsmanship and industries so as to restore partially the concept of self-reliance in a village economy. The programmes of the KVIC aim at employment generation in a gainful way to tackle rural unemployment and encourage the best use of local manpower skills, raw materials and technique/process of production. For this purpose, the KVIC disbursed financial assistance of Rs 602 crore in the form of grants and loans to 13.88 lakh khadi producers and 26 village industries employing 26.82 lakh persons during 1986-87. Of this amount, khadi producers accounted for Rs 328.50 crore (55 per cent) and village industries, Rs 273.65 crore (45 per cent). Its operation has increased sizeably over a decade as indicated by disbursement, i.e., an increase of 14.43 per cent per annum from Rs 156.45 crore in 1977-78 to Rs 602.16 crore in 1986-87; for khadi it increased at 12.30 per cent and for village industries at 17.70 per cent per annum. But the programmes of the KVIC, particularly in case of village industries, have grown over time without corresponding efforts to improve the information system, reliability and accuracy of data for this sector. The present information system of the KVIC is just to meet the statutory requirements.

These data are not useful in indicating the profile and realities of village industries. Though the Working Group on the KVIC (1984) and KVI Review Committee (1987) have made a number of recommendations for improving the data system and monitoring in practice no initiatives and steps were taken to follow them. Because of lack of accurate and dependable statistics relating to village industries, financial support from the Central government for expansion of its programmes, as shown in the KVIC's budget for 1986-87, was substantially curtailed. For the same reason commercial banks also gave limited financial

assistance. The government allocated Rs 98.14 crore (64 per cent) as against the demand for Rs 153.60 crore in 1986-87 and commercial banks gave a credit of Rs 80 crore as against the target of Rs 150 crore for the years of 1980-85. The need for accurate and up-to-date information became so vitally important for the KVIC that it convened an all-India seminar of statistical staff of the KVIC and KVI boards in June 1988. One of the outcomes of the three-day seminar was the appointment of a three-member committee including experts from the National Sample Survey Organisation (NSSO) and Indian Statistical Institute, Delhi to suggest, among others, the modalities and procedures for data system. The said committee is still deliberating upon the issues.

LIMITATIONS OF PRESENT DATA SYSTEM

The KVIC collects quarterly and annual data relating to assisted units through a comprehensive proforma from the KVIC State offices and also from the KVI boards. Then, these data are compiled by the staff at the head office and published in KVIC's annual report. The annual report of the KVIC is in two parts, (i) text, and (ii) tables. The textual portion highlights the working of the KVIC, and the second part in the form of tables provides data industry-wise and State-wise on certain important variables. Since data relate to assisted units of village industries, the units which either obtained financial assistance from other sources or did not do so remain omitted. Moreover, despite calling in and compiling detailed information from the assisted units, the KVIC's annual report, due to space constraints, publishes data relating to selected items like disbursement, employment, production, earning and sales. Important items like the number of assisted units, fixed and working capital, contribution of owners/workers, number of skilled and non-skilled workers, types of assistance—

raw materials/equipment and machinery supplied, grants and loans, marketing support, training of workers, etc., and motive power—manual or electricity-based units—are omitted. These type of data would have been very useful for the KVIC in planning and administration of schemes as well as for research.

The report furnishes data too aggregately. The aggregation of institutional units and individual units undermines the quality of data as the former units are covered on census basis and the latter on a different sample basis. Moreover, the institutional units maintain records of their operation and form a predominant position in disbursement and production, thus, qualifying for their greater weightage in the data pool. The individual units, though large in number relatively less important in disbursement and production, are covered on different sample basis. These units rarely maintain records, and even if they do so, the information may not be adequate and according to the reporting proforma of the KVIC. There is no mention, at all, in the annual report about the concepts and methods followed in collection, compilation and aggregation of data according to industry and State. In the text of the report adequate information on villages/blocks/districts covered by the KVIC operation is not available. In the annual report of 1986-87, the number of villages mentioned on page 1, 1.5 lakh, relates to two decades in the past. There is hardly any discussion on the performance of assisted industries in different States. It is difficult to find any logic and economic meaning in presentation of certain ratios, as given in the KVIC's annual report (1986-87), such as per capita (number of units or workers full/part time?) net disbursement, ratio of production (annual) to disbursement (cumulative), and ratio of net disbursement to value of production plus sales, etc. All in all, whatever be the data given in the KVIC's annual report 1986-87 they lack, apart from adequacy, a meaningful analysis and systematic presentation.

The quarterly and annual returns are called in by the KVIC, the former for selected items and the latter for a large number of items for comprehensive coverage. Institutional producing units, which are covered on a full count basis and maintain regular staff and proper records, pose no problem in respect of both these returns. Through quarterly return the institutional units may be asked to furnish basic information in actuals relating to disbursement, employment,

production and sales, etc., and individual producing units (only those units which were assisted or contacted during the quarter), number of units assisted, disbursement, producer's contribution, all in actuals, and data relating to employment and production, provisional. These quarterly provisional data need to be replaced by actuals for the year from the annual return. The annual questionnaire should contain, among others, (1) number of units; (2) disbursement; (3) owner's contribution/equipment; (4) output; (5) employment in manhours of (a) hired workers, and (b) family members; (6) cost of (a) inputs (i) from local market and (ii) through KVIC, (b) other cost; (7) sales in (a) local market, (b) through KVIC and (c) other; and (8) earning (net).

The real problem arises when there are a large number of individual producing units. The sampling procedure for these KVIC-assisted units at the State level/ Union Territory level can be stratified at two stages: one with blocks/or disbursing centres (whichever is appropriate) as the first stage units and producing units as the second stage units. The blocks/or disbursing centres are chosen with a probability proportional to size (number of production units) with replacement. The sample of 10 per cent of assisted producing units in the second stage could be selected randomly. The illustration (Table) will be enough to explain the method:

| Blocks/ Disbursing Centres in a State | No of Producing Units | Cumulative Sum | Range |
|--|-----------------------------|-------------------|---------|
| 1 | 50 | 50 | 1-50 |
| 2 | 40 | 90 | 51-90 |
| 3 | 100 | 190 | 91-190 |
| 4 | 60 | 250 | 191-250 |
| 5 | 50 | 300 | 251-300 |

We must note that any block/centre which has few units (say, less than the number of industries covered) should be ignored. To select a block or disbursing centre, a random number between 1 to 300 is drawn. Suppose this number is 165 which falls in block 3 which covers numbers 91 to 190 (inclusive). If a second block is selected the above process is repeated with a new random number between 1 and 300. Selection of block/centre with replacement is necessary in order to keep the probabilities of selection proportional to the sizes. At the second stage, from each selected block/centre a sample of 10 per cent of all assisted units should be taken on a random basis irrespective of industrial activity.

There may yet be some problems particularly when sometimes we find that non-assisted units outnumber the KVIC-

assisted units in the region. In such a situation, in order to check unbiasedness of sample data in the context of total population, these may roughly be compared with those relating to household and non-household manufacturers available in reports of Economic Census, 1977 and 1980. The report of Economic Census, 1980 gives some data, relevant for such comparisons. It contains statistics on 'own account' enterprises/establishments in India and also in various States/Union Territories. The data relate to type of ownership (private and co-operative), location (rural and urban), broad activity (agriculture and non-agricultural), employment (hired workers and others as well as female and male workers), Scheduled Caste/Tribe-owned units, employment size, power/fuel-based or manual operation. These data are given by industry which also includes 30 types of handicrafts.

SOME SUGGESTIONS

In the light of the above limitations of the data, a few suggestions on allied matters may help to improve overall data position.

Since unpriced annual report of the KVIC containing data on KVI sector cannot be distributed to all data seekers, a priced publication entirely devoted to the statistics on khadi and village industries will be welcome by all data users, particularly, banks, development organisations and researchers. Though the commercial banks and RRBs have an extensive network of branches in rural areas and the KVIC desires them to expand the financing of village industries, data constraints in this respect really work as impediments in getting bank finance for these activities to the desired extent. Therefore, improving the accessibility to detailed data on KVI sector would serve a useful purpose.

The present proforma should be revised (as has been recently agreed to by the KVIC) with expert advice to retain the most relevant items from the point of view of policy-making. All the concepts used in the proforma for data collection should be clearly defined in a simple language. Certain concepts also need to be standardised like, employment in manhours/man-days, etc. In case of individual units the data collected through the sampling methods should be checked in the light of their validity for the whole population. This could be done once in five years at least for five relatively important industries through the census method. In this, annexures of the report of Economic Census, 1980 would be very useful

reference material (particularly annexures I and II of House and Enterprise Lists and annexure X of concepts and definitions).

In presenting the information the break-up of data by institutional units and individual units will be very useful as they have significant differences in quality and method of collection. In addition to absolute figures, certain analyses like percentages, frequency and economic/financial ratios permitted by data will be helpful in the ready use of such statistics.

The review of certain concepts which are followed by the KVIC as eligibility criteria for financial assistance, will be much needed. Firstly, an investment of Rs 15,000 in an activity as an 'eligibility criterion' for financial assistance from the KVIC was fixed long ago and it has remained unadjusted for price increase. Secondly, the villages in the vicinity of big cities have been transformed into small towns over the years due to fast urbanisation. Moreover, as a result of population growth, the average population size of a village has considerably increased over the years. The criterion of village-size of 5,000 persons, if strictly applied, will render a number of genuine villages ineligible for KVIC assistance. Thus, in the KVIC's programmes, all these criteria of investment ceiling and village-size need a continuous review.

Since the responsibility for data collection is entrusted to statistical staff at district level, their skills should be improved. They need to be trained in technical details of sampling procedures and appraised of various concepts used in quarterly and annual returns. They should be motivated to ensure the maximum reliability of data through collecting actual details and avoid guess-work in this work. Once in two years a conference/workshop should be held to help them not only to exchange views on the problem but also the changes in attitude towards data work and their importance.

Apart from monitoring statistics on the KVI sector, the commission should also carry out some regular studies on project feasibility for industry level, profile and performance of assisted industries and marketing potential for the products of the sector. In the areas where the KVIC lacks experts and staff, such studies can be sponsored in research institutions and universities. These studies would have the benefit of a scientific approach, be unbiased and cost economic.

[My grateful thanks are due to J C Sandesara for his encouragement and suggestions in preparation of this draft. I am alone, however, responsible for the errors, if any.]

SCHEDULE II

NOTES FORMING PART OF THE ACCOUNTS FOR THE YEAR ENDED 31ST MARCH, 1991

1. PRINCIPAL ACCOUNTING POLICIES
- A) General
- These accounts have been prepared on the historical cost basis and in accordance with the statutory requirements prescribed under the Banking Regulation Act 1949 and practices prevailing in the country.
- B) Transactions involving foreign exchange.
- Assets and liabilities in foreign currencies have been translated at the rates ruling at the end of the year except for
- a) Pakistan Rupees which have been translated at brokered rates.
- b) Outstanding forward exchange contracts which have been disclosed as contingent liabilities at the contracted rates.
- Outstanding forward exchange contracts are revalued at the bank's applicable rates of exchange as at the end of the year and the resulting profit or loss on revaluation is accounted for.
- C) Investments
- i) Securities of the Central and State Governments are valued at face value and the differences between cost and face value are amortised over the remaining period till maturity of the respective securities.
- ii) All other investments are valued at cost or under.
- D) Advances
- i) Provision for doubtful advances: The Management reviews the advances/loan portfolio each year in addition to periodic reviews and based on its judgment sets aside specific provision for doubtful advances. The provision for doubtful advances is made to the satisfaction of the auditors.
- ii) Advances are stated net of bills of exchange rediscounted and specific provision in respect of doubtful debts.
- iii) No credit has been taken for interest on amounts considered doubtful.
- F) Fixed Assets
- a) Premises have been valued at cost and furniture and fixtures including vehicles and equipment have been valued at cost less depreciation.
- b) Depreciation has been provided for on the written down value method at the rates specified in Schedule XIV of the Companies Act 1956 except that computers, equipment and vehicle are depreciated at 33 1/3%.
- c) Furniture and fixtures etc. at written down value includes items in the nature of premises added to rented office buildings on which depreciation is charged at 5%.
- d) Depreciation has been provided on additions for the full year irrespective of the date of addition and no depreciation has been provided on assets sold/discarded during the year.
- F) Staff Benefits
- Provision for gratuity and pension benefits to staff (inclusive of provision for past service liability) has been made on the basis of actuarial valuation. Separate funds for gratuity and pension have been created and the contributions payable (inclusive of contribution for past service liability) have been paid to the respective funds before the year end.
- G) Bills received from constituents for collection on their behalf are entered in memorandum register and are recorded in the financial ledger only when collected. Bills for collection outstanding as on 31st March 1991 have however been shown in the Balance Sheet under the relevant head of accounts.
- H) Net Profit
- The net profit disclosed in the profit and loss account is after
- (i) Provision for taxes on income in accordance with statutory requirements.
- (ii) Provision for doubtful advances.
- (iii) Other usual and necessary provisions.
- HEAD OFFICE RESERVE ACCOUNT
- Head Office Reserve Account represents the amount debited to the convertible rupee account of Head Office with the Bombay Branch to meet the cost of acquisition of a residential apartment at Bombay.
- The previous year's figures have been regrouped/rearranged wherever necessary.
- Per our report attached to the Balance Sheet

Auditors' Report on the Accounts of the Indian Branches of Algemene Bank Nederland N.V.

We have audited the Balance Sheet of the Indian Branches of Algemene Bank Nederland N.V. as at 31st March 1991 signed by us under a reference to this report and the relative Profit and Loss Account for the year ended on that date.

Under the provisions of Section 29 of the Banking Regulation Act 1949 read with the provisions of Sub-section (1) (2) and (5) of Section 211 and Sub-section (5) of Section 227 of the Companies Act 1956 the Balance Sheet and the Profit and Loss Account are not required to be and are not drawn up in accordance with Schedule VI of the Companies Act 1956. The accounts are therefore drawn up in conformity with Forms A and B of the Third Schedule to the Banking Regulation Act 1949.

We report that

- 1 we have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purpose of our audit and have found them to be satisfactory
- 2 the transactions which have come to our notice have been in our opinion within the powers of the Indian Branches of the Bank

3 in our opinion proper books of account as required by law have been kept by the Indian Branches of the Bank so far as appears from our examination of those books

4 the Balance Sheet and the Profit and Loss Account of the Indian Branches of the Bank drawn up by this report are in agreement with the books of account

5 in our opinion and to the best of our information and according to the explanations given to us such Balance Sheet and Profit and Loss Account together with the notes thereon, give the information required by the Companies Act 1956 in the manner so required for banking companies and on such basis give a true and fair view

(a) in the case of the Balance Sheet of the state of affairs of the Indian branches of the Bank as at 31st March 1991

and

(b) in the case of the Profit and Loss Account of the profit of the Indian branches of the Bank for the year ended on that date

Imperialist Intrigue and International Law

A G Noorani

The Kuwait Crisis: Basic Documents; Grotius Publications, P O Box 115, Cambridge CB3 9BP, UK, \$ 35

THE Research Centre for International Law of the Cambridge University has put students of international law in its debt by sponsoring the editing and publication of this, the first, volume in the Cambridge International Documents Series. Its editors are E Lauterpacht Q C, C J Greenwood, Marc Weller and Daniel Bethlehem. The volume traces the history of British Kuwait intrigues behind the back of the Ottoman Empire, the rise to statehood of Iraq and Kuwait and the events following Iraq's invasion of Kuwait till the end of November 1990. A later volume will deal with the sanctions and their economic consequences. The present volume conforms to the highest standards of legal and historical scholarship.

Perhaps the most useful part of the work is the collection of documents on the historical background, beginning with the secret agreement between the British and the Sheikh of Kuwait, which undoubtedly was a part of the Ottoman Empire then. One is reminded of China's oft repeated lament that the Sino Indian boundary question is a legacy of colonialism. The Iraq Kuwait differences were certainly rooted in the colonial past. British interests in the Gulf were watched from Calcutta. Aden was a part of the Bombay Presidency.

"Kuwait is the best indeed the only, port deserving of the name in the Persian Gulf", the viceroy, Lord Curzon wrote on November 19, 1898 shortly before assuming office in January 1899. He rejected Turkey's claim to sovereignty over Kuwait but noted that "we recognise Turkish authority on the coast line considerably to the south of Kuwait". He, therefore, advised against asking for a concession from Turkey for a railway with a terminus at Kuwait. A senior official in the India Office, W Lee Warner, who later became an authority on Indian princes, had written a note on Kuwait dated June 23, 1898 to which Curzon referred. The note said, "Kuwait or Grane appears to be within the limits of Turkish influence, if not Turkish sovereignty". He recalled that on July 17, 1897 the Foreign Office had taken the view that "we have never acknowledged Kuwait to be under Turkish protection, but it is doubtful if we could deny Turkish influence". It cited arguments for and against the Turkish claims. The only effective argument against Turkey was that it had not "effectively maintained" its sovereignty over Kuwait. Five arguments were cited to show "the advantages of acquiring control over Kuwait" - a very fair harbour, a potential railway terminus, a trade route, control over piracies and slave trade, and "exclusion of Russian or other foreign influence".

This settled the issue. It is considerations like these, and not the authority of inter-

national law, which governed imperial policy. But once territory was acquired, international law, fashioned largely by the European powers, was invoked to sanctify the conquest. Witness Goa.

The secret British-Kuwait accord of 1899 bound the Sheikh of Kuwait "not to receive" the agent of any power without British permission or assign any part of his territory to such a power. In return the British promised him "the good offices of the British government towards you"—and no doubt against Turkey. In 1901 Turkey agreed with the British not to send troops to Kuwait.

What followed thereafter is, as they say, history. Turkey, an oriental empire in an enfeebled state, the sick man of Europe, colonialism on the ascendant, vassals of the empire willing to accept Western support to assert their 'freedom' from the empire's control even if it meant selling this freedom, next, to the Western power.

The documents are a treat for any student of that era. We find interesting nuggets, such as British despair over their "impossible client in the person of the Sheikh". Already by then the boundary question had cropped up. Kuwait's boundaries in 1902 were 'ill defined'. Turkey retained its military outpost on the island of Bubiyan. As the area became increasingly favoured as the likely ending point for the proposed Baghdad railway, the government of India became restive over Turkish presence there.

On July 29, 1913 the British government and the Ottoman Imperial Government signed a Convention which recognised (Article 1) that "the territory of Kuwait constitutes an autonomous *Eaza* of the Ottoman Empire". Turkey joined the wrong side in the first world war which broke out in 1914 and the Convention unratified as it was became a dead letter.

After the war, the Ottoman provinces of Baghdad, Mosul and Basra known collectively as Mesopotamia were detached from Turkey and transformed into the state of Iraq over which Britain acquired control as a Mandatory Power under a Mandate of the League of Nations. Iraq became independent in 1932. Till the revolution of 1958 it was under British influence.

Kuwait became a British protectorate and remained so till 1961 when it became independent. In two agreements of April 23, 1923 and of October 31, 1932 Iraq and Kuwait agreed on their frontiers. What is more to the point, on October 4, 1963 Iraq and Kuwait reaffirmed their accords.

The colonial era ended but the scourge that afflicted the entire Third World gripped Iraq. It would not forget the past. None can read Iraqi documents on its territorial claims against Kuwait without being struck

by the futility of the entire discord. Granted that Kuwait was obdurate, Iraq's attack was simply indefensible.

But the US used this not to repel the aggression but to subjugate Iraq. In the process, it undermined the United Nations.

The UN Security Council Resolution 660 of August 2, 1990, immediately after the Iraqi aggression, demanded Iraq's withdrawal but also called upon Iraq and Kuwait to begin negotiations for resolving their differences. More, it supported "all efforts in this regard, and especially those of the League of Arab states". In a major policy switch this line was abandoned. On August 8, President George Bush announced the deployment of troops in the area. Saudi Arabia was "persuaded" to invite them.

The United Nations Charter confers on the Security Council the "primary responsibility for the maintenance of international peace and security". Chapter VI defines its powers with respect to the peaceful settlement of disputes. Chapter VII empowers it to take action with respect to acts of aggression or breaches of the peace.

The Security Council is empowered to impose economic sanctions. If these are considered initially to "be inadequate or have proved to be inadequate subsequently", military action may be taken (Article 42). *No such finding was made by the Council in the present case.* Resolution 665 imposing the sanctions was passed on August 25, 1990. Three months later, on November 29, 1990, the Council passed Resolution 678 authorising member states "to operating with Kuwait 'to use all necessary means to uphold and implement' the Council's resolutions. The use of force was not specifically mentioned. The Council had not the power to give a power of attorney to member states. The charter enjoins the Council to retain its control. To this end it provides (Article 47) for the appointment of a Military Staff Committee consisting of the chiefs of staff of the five veto powers, "to advise and assist" the Council on all questions relating to the Security Council's military requirements, the employment and command of forces at its disposal. All members undertake to make available to the Council on its call armed forces. Despite the Soviet Union's insistence the Military Staff Committee was not activated. It is this committee which is "responsible under the Security Council for the strategic direction" of the forces.

The US went to war unilaterally in flagrant breach of the UN Charter, not to evict Iraq from Kuwait but to subjugate Iraq. In the result it destroyed Iraq and imposed terms reminiscent of the Versailles Treaty. The Security Council endorsed them and exposed the irrelevance of the Charter, once again.

It is of a piece with the criminal folly of the Third World that Iraq brought all this upon itself by its recourse to force against a neighbour and by its bankruptcy of basic good sense.

Special Employment Programmes

N J Kurien

Rural Employment Programmes in India: The Implementation Process
by R K Tiwari, Indian Institute of Public Administration, New Delhi, 1990,
pp 271, Rs 150.

A MAJOR feature of the Indian development process has been its inability to generate enough employment opportunities for the growing labour force. Sluggish industrial growth had been the major problem during the sixties and seventies. Though the growth performance had been better during the eighties, the structure of growth was such that it could not absorb much labour. Labour absorption in agriculture also has been steadily declining since the Seventies. Indeed, the overall economic growth of around 5.5 per cent per annum achieved during the eighties was significantly higher than the trend rate of growth of about 3.5 per cent for the earlier decades. The growth of employment during this period, however, was far below the projected levels and well below the growth of labour force.

Rural employment programmes, the subject of this book of R K Tiwari, have a long history which goes back to the last century. The colonial rulers introduced the concept of 'test relief works' to gauge the intensity of famines. Large attendance at such works by villagers was indicative of the seriousness of droughts. Depending on demand, more and more wage employment was provided at labour intensive public works. The strategy of wage employment was initiated in post independence India with the introduction of Rural Manpower Programme (RMP) in 1961. RMP was started as a pilot project in 32 CD blocks. Its objective was to provide employment for 100 days to the needy who were exposed to long spells of seasonal unemployment. A country wide scheme known as Crash Scheme for Rural Employment (CSRE) was launched in April 1971. It was intended to provide employment to at least 1,000 persons in each district through labour intensive works and to create durable assets. An evaluation of the scheme revealed that although it achieved its immediate objective to provide employment opportunities, the benefits were thinly scattered. Lack of proper planning was also evident. In the light of the experience of RMP and CSRE, a Pilot Intensive Rural Employment Programme (PIREP) was started in November 1972 in five selected CD blocks for a three year period. Its objective was to evolve a comprehensive rural employment strategy for the entire country. The Expert Committee which reviewed PIREP, however, expressed the view that the entire development strategy should be based on labour-intensive technologies so that maximum labour absorption takes place through the regular development process, leaving a small backlog of unemployment for being tackled through special employment programmes.

The Food for Work Programme (FWP), started in April 1977, was a major landmark in the history of rural employment programmes in India. Though a major inspiration for FWP was the desire of the government to offload the mounting foodstock, it soon became popular in rural areas and came to be recognised as a major instrument of rural employment and development. The nation succeeded in effectively fighting the drought of 1979-80 by providing about 600 million mandays of employment under FWP. A nation wide evaluation of the programme, however, brought out a number of deficiencies in its implementation. These included erratic disbursement of foodgrains, delay in measurement of earthwork, non-durability of assets created under the programme, inadequate technical support and lack of supervision leading to dilution of the technical specifications at the stage of implementation. Besides these deficiencies, there were three major reasons due to which the programme suffered a setback. First, the programme was implemented on an *ad hoc* basis. In the context of this uncertainty, the State governments were not able to provide the needed technical and administrative support to plan, oversee and monitor the programme effectively. Second, there was no attempt by the States to formulate a shelf of projects which could take into account the local needs and could also fit in with the overall priorities of the region where the programme was implemented. Third, in many States for want of financial provision for material component of works and also to give part of wages in cash, there was a tendency to take up earth works, mainly road works, which were not of a durable nature.

The National Rural Employment Programme (NREP) an improved version of FWP, was introduced on a nation wide scale in October 1980. NREP was made an integral part of the Sixth Plan in April 1981. It is being implemented since then as a centrally sponsored programme on a 50:50 financial sharing basis between Central and State governments. Its major objectives are generation of additional employment and creation of productive community assets. The guidelines provide that preference should be given to landless labour for employment. Further among the landless labour priority should be for SC/ST and women. The programme was being implemented through District Rural Development Agencies (DRDAs). The works were to be taken up for execution on the basis of a shelf of projects and annual action plan prepared by the DRDAs. Works were mainly executed through panchayat raj institutions. Workers

were to be paid minimum wages fixed under Minimum Wages Acts. Part of the wages were paid in terms of subsidised foodgrains. Allocation of resources to the States was to be made on the basis of a formula under which 50 per cent weightage was given to the number of agricultural labourers, marginal workers and marginal farmers and 50 per cent to the incidence of poverty. For ensuring creation of durable assets in the process of employment generation, up to 50 per cent of the allocation was permitted to be used for materials.

The major theme of the book under review is the implementation process of NREP. In the introduction, the author lays down the objectives of the study as being to understand the theoretical aspects of utilisation of surplus labour for capital formation, to review the rural employment programmes undertaken since the Third Plan, to oversee the implementation process in the National Rural Employment Programme; to ascertain how far the policy outcomes are consistent with the objectives, and to find out the principal factors affecting the realisation of the objectives. The book is organised into two sections. The two chapters in section one are 'Surplus Labour and Capital Formation' and 'Review of Rural Employment Programmes'. While the former deals with the analytical logic of wage employment programmes, the latter gives a fairly comprehensive review of rural employment programmes since the Third Plan. Though the classical theory of surplus labour associated with Nurkse and Lewis is invoked in the first chapter the discussion in the rest of the book does not make enough use of the analytical framework provided by it.

EMPIRICAL ANALYSIS

The major contribution of the book is the empirical analysis of the actual operation of NREP in Madhya Pradesh. This is based on field data collected by the author from two selected districts, Durg and Raipur, during the year 1985-86. The field survey was confined to seven CD blocks, four in Raipur and three in Durg. A total of 42 NREP works in the seven blocks were taken up for detailed study. Besides, 200 workers engaged in on going works of all types were interviewed. In addition, information was also collected from government circulars, reports, progress reports, shelf of projects and annual action plans, both at the block and district levels. Planning and implementation details were also collected from the personnel of the Rural Engineering Service and Panchayat institutions. The vast data on various aspects of NREP collected in the sample are summarised and presented in about 50 tables given as annexure to the book. Since the sampling design was a purposive one, no attempt was made to draw inferences of a universal nature applicable to the country as a whole or even the State as a whole.

The second section of the book has seven chapters. While the first one presents the objectives and methodology of the study, the

set-up, local planning process, problems of implementation, distribution of foodgrains, impact of the programme and major findings and policy implications, respectively. Two special aspects of the administrative set-up for implementation of NREP in Madhya Pradesh are the involvement of the gram panchayats and the Rural Engineering Service (RES). Well before government of India assigned a key role for panchayats in the Jawahar Rozgar Yojana (JRY) in 1989, the Madhya Pradesh government had given the gram panchayats the responsibility of implementing the NREP works. All NREP construction works in the villages were to be executed by the BDO through the gram panchayats. The accounts of the works were to be maintained by the BDO. Certainly, the role of the panchayat was limited as compared to the JRY of later years. In the case of minor irrigation and other works involving more than one gram panchayat area, the responsibility for implementation rests with RES, an agency specifically created for providing engineering support to rural works programmes. The RES personnel are expected to provide technical support for works taken up by the gram panchayats. In actual practice, however, little technical support had been forthcoming from RES. Often their role is limited to 'technical control' which in reality is nothing more than 'technical harassment'.

The author utilises a long chapter to capture the various steps involved in local planning process. He describes how a set of State guidelines superimposed over the Central guidelines leads to adoption of material intensive construction works, how shelf of projects for three-year and five-year periods are prepared, how annual action plans are prepared, how the powers of sanction are delegated, how cost estimates are arrived at and how funds are released to the implementing agencies and so on. One thing which clearly emerges is the fact that NREP was looked upon by all those who had the powers of decision-making as an asset creation programme rather than employment generation programme. This is further confirmed by the nominal role played by the DRDA in the planning and execution of the programme.

IMPLEMENTATION PROBLEMS

On the basis of the information collected during the survey the author presents a long list of implementation problems. It is interesting to note that these problems identified by the author are substantively similar to those brought out by the nationwide concurrent evaluation survey of NREP sponsored by the department of rural development of the government of India during 1987-88 and the Report of Evaluation of NREP by the Programme Evaluation Organisation. Though the principal objective of NREP has been to provide employment to the needy during the slack seasons, in actual practice the employment generation is more attuned to the budget cycle. As a result, very little employment is generated

during the first quarter of the financial year which is indeed, the main slack season. On the other hand more than half of employment generation takes place during the last quarter of the financial year.

Inflated estimates of employment generation under wage employment programmes have been reported by various evaluation studies in the past. This has occurred due to a variety of reasons—actual wages being higher than minimum wages, higher share of skilled labour, higher material component, outright misappropriation, etc. The author has independently worked out the employment component of a number of works taken up in the sample. He concludes: "So much so that in a building work of Rs 50,000, the mandays generated as mentioned by the blocks were in the range of 2,200 to 3,000 but according to our calculations it should be between 753 to 910 mandays at the most." No further comments on this issue are called for!

Other major problems associated with the implementation of NREP works are incomplete works, recovery of unutilised funds, selection of labourers and payment of wages, lack of technical support, short life-span of the assets created and absence of arrangements for maintenance of assets created. Using the sample information the author highlights the seriousness of each issue. The tendency of starting new works even when a large number of works remains incomplete is not peculiar to Raipur or Durg. Lack of recovery is part of the politics of anti-poverty programmes. Another casualty is the foodgrain component of the wage payment. Majority of the labourers could not get the benefit of subsidised foodgrains due to one reason or another.

BASIC ISSUES AVOIDED

The impact of the programme is assessed in terms of employment generation, incomes and benefits from the assets created. Not only that Madhya Pradesh is one of the least developed States in the country, the districts taken up for the study are particularly backward. More than 70 per cent of the rural population in both the districts are estimated to be below the poverty line. A significant share of them was from SC/STs and other socially deprived sections of the rural community. Both the districts are characterised by a high proportion of rainfed monocropped area. In the absence of any significant industrial development in these districts, the vast majority of the rural population is dependent on agriculture. The landless labourers get barely two to three months of employment in agriculture. The prevailing wage rate was far below the statutorily fixed levels. A number of exploitative practices including bonded labour was brought to the notice of the survey team. Under these conditions NREP employment was extremely popular with the rural poor. There was high turn-out of labourers in earth works varying from 200 to 500 per day resulting in a situation where such works got completed in a few days. In the case of construction

work usually there was no response or employment which often denied the chances of the most needy. On the basis of data collected from 200 labourers who were interviewed, it was found that the income received varied from Rs 28 to Rs 112 per beneficiary per year. Considering the fact that only the privileged among the poor got employment under the programme, the overall impact of the programme on the incomes of the poor is, indeed, marginal. Most of the assets created by the programme did not provide any direct or exclusive benefits to the poor. The preferred items of work were roads, school buildings, tanks, wells, community centres and panchayat bhavans. Not much emphasis was given to productive type of works like minor irrigation, drainage, land reclamation, etc, which generate sustained employment opportunities.

The book confines itself to a study of the implementation process of NREP which had been in existence for a decade from 1980 to 1989. From 1983 to 1989 another wage employment programme, viz, Rural Landless Employment Guarantee Programme (RLEGP), had also been implemented throughout the country. Though RLEGP was intended to provide a minimum of 100 days of employment to one member of each landless agricultural labour household, in actual practice nothing of this sort happened. In terms of coverage, implementation process, etc, it had been similar to NREP. Both these programmes were merged to form JRY in 1989. The principal departure of JRY is that the elected village panchayats are entrusted with the planning and implementation responsibilities of JRY throughout the country. As yet no comprehensive study of the implementation process of JRY has been made. Certain impressionistic studies give the indication that JRY is going on well in regions where panchayats are vibrant whereas it is in doldrums in areas where panchayats are dormant. For more authentic inferences based on scientific studies one has to wait for some more time.

Tiwari's book is certainly an important contribution to the literature on anti-poverty programmes in India in general and wage employment programmes in particular. The book, however, hardly touches on some of the basic issues. Can there be significant improvement in the planning and implementation of wage employment programmes in the present milieu? Are they not just placebos for the poor by the non-poor? Have the employment programmes helped the poor to improve their bargaining power with the non-poor for improved wages and other working conditions? Are we in a position to talk realistically about employment as a fundamental right? Is it not feasible to introduce an Employment Guarantee Scheme (EGS) of the Maharashtra type throughout the country? Employment programmes being obviously short-term measures, what are the long-term measures needed to solve the rural employment problem? These are only some of the issues to be sorted out by similar studies in the future.

Rushdie's *Shame*: Postmodernism, Migrancy and Representation of Women

Aijaz Ahmad

The essential task of Third World novels, it is said, is to give appropriate form to the national experience and the range of questions that may be asked of these texts must predominantly refer to this experience. Consequently other kinds of questions have to be subordinated to the primacy of the authorised questions. It is with these other questions that the present essay is primarily concerned.

Focusing more narrowly on the politics of reading individual texts the essay examines Salman Rushdie's book Shame. The author's purpose is to offer a symptomatic reading of an ideological location and in this context the essay locates the ideological underpinnings of Rushdie's work principally in the high culture of modernism and postmodernism.

THE axiomatic fact about *any* canon formation, even when it initially takes shape as a counter-canon, is that when a period is defined and homogenised, or the desired literary typology constructed, the canonising agency selects certain kinds of authors, texts, styles, and criteria of classification and judgment privileging them over others which may also belong in the same period, arising out of the same space of production, but which manifestly fall outside the principles of inclusion enunciated by that self-same agency, a certain kind of dominance is asserted and fought for, in other words, and is in turn defined as the essential and the dominant. The history of modernism is significant in this regard. It was the modernist avant-garde itself which first posited modernism as a comprehensive negation both formal and philosophical, of the canonical realism of 19th century Europe, and claimed, moreover, that realism which had been definitively broken superseded and buried in the period of high modernism the quarter century before 1940 let us say. In turn, the triumph of modernism is indicated today precisely in the fact that realist texts produced during that same period and in the same Euro-American spaces now find no significant place in the literary curriculae and critical discourses pertaining to that period and place, regardless of the number, the worth or the social influence of such texts in their own time. And, it is the hegemonic self-representation of modernism as an utter negation of realism which makes it virtually impossible now to see how many kinds of modernist narrativity, Kafka's for example, have been facilitated by the machineries of representation developed in 19th century Europe. This canonical status of modernism seems to be at work even in relation to what has now come to be known as postmodernism. As everyone knows there were all sorts of distinct movements—Imagism, Surrealism, Dada, Cubism, and so on—during the period which later came to be canonised under the unified rubric of modernism. Once that category had been set

in motion as the art of the 20th century, however, what came after it could only be seen in relation to it (i.e. it could only be a *post* of modernism itself). The hegemonic manoeuvre was evident, further, in the fact that any text which aspired to be included in the category of 'what came after' had (a) to have enough of modernism within it and (b) also to diverge sufficiently in a new avant-gardist way. In either case, processes of canon formation meant also that certain kinds of questions could not now be asked. One could not read a modernist or postmodernist narrative from the standpoint of realism, for example, without being guilty of Derrida's famous 'metaphysics of presence'. The subordinating or even foreclosing of certain kinds of questions, the foregrounding of others, is the essential canonising gesture.

Analogous procedures of privileging certain kinds of authors, texts, genres and questions seem to be under way now with regard to 'Third World literature'. The essential task of a 'Third World' novel, it is said, is to give appropriate form (preferably allegory, but epic also, or fairy tale, or whatever) to the national experience. The range of questions that may be asked of the texts which are currently in the process of being canonised within this categorical counter-canon must predominantly refer, then, in one way or another, to representations of colonialism, nationhood, post-coloniality, the typology of rulers, their powers, corruptions, etc. There is no gainsaying the fact that these are among the great questions of the age. What is disconcerting nevertheless is that a whole range of texts which do not ask, in any foregrounded manner, those particular questions would then have to be excluded from or pushed to the margins of this emerging counter-canon. Worse still, a whole range of other kinds of questionings—pertaining to other sorts of literary influences and experiential locations, the political affiliations of the author, representations of classes and genders within the text, and myriad such issues—would then have to be subordinated

to the primacy of the authorised questions, about 'nation' etc. It is with these other questions that the present essay shall be, in the main, occupied.

I

I have referred elsewhere to the great proximity and heterogeneity of cultural productions in our spaces,¹ both of the archival and the non-archivable kinds, which simply exceed the theoretical terms of 'Third World literature'. Here, I want to look briefly at only one author—Salman Rushdie—who occupies a distinguished place at the very apex of 'Third World literature', and at one of his books—*Shame*—which has already become something of a classic of this counter-canon. What happens to one's own reading, I would be curious to know, if one changes, in any appreciable degree, the questions? Aside from changing the questions somewhat, my main interest in undertaking this exercise is not to attempt a *sufficient* reading of either the author or the book, in some radicalised version of New Critical etiquettes, but, rather, to offer a *symptomatic* reading of an ideological location which makes it possible for Rushdie to partake, equally, of the postmodernist moment and the counter-canon of 'Third World literature'. For, there now appears to be, in the work of the metropolitan critical avant-garde, an increasing tie between postmodernism and Third Worldist canonisations. Thus, for example, whether we look at the literary critics who have done the most productive and influential work on this idea of a generic difference between 'the West' and the 'Third World' or at the actual authors who are accorded central importance in this evolving counter-canon—García Márquez, Fuentes, Rushdie, among others—we find, first, that these critical positions are framed by the cultural dominance of postmodernism itself, and, second, that there is enough in the authors upon whom critical attention is so trained which is appropriable for those sorts of readings, usually with the text's own

ference for Marquez over Asturias, for example, has always appeared to me to be essentially a political matter, which reflects the greater formal and political availability of Marquez (as against Asturias) for postmodernist appropriations on the one hand, and, on the other, the politics of avant-gardist literary taste in our time. The same predominance of postmodernist etiquettes of reading is palpably present in other cognate sub-disciplines that are evolving alongside 'Third World literature', as the roster of those who undertake 'colonial discourse analysis' would amply show. Nor is this subjection of the so-called 'Third World' text to postmodernist scrutiny something reserved for the best known; it now appears to be a fairly general tendency. Fredric Jameson occupies a different and distinctive position in all this because of (a) his arduous attempts to combine postmodernism with Marxism, (b) his identification of 'Third World literature' with 'naïve' realism and, farther back, specifically with allegory, and (c) his upholding of 'Third World literature' as a global other of postmodernism itself, under the insignia of 'nationalism'. What is remarkable even in his readings, different and superior as they are, is that he too is preoccupied, when one looks at the totality of his 'mapping', with defining a relation between 'Third World literature' and the 'global American culture of postmodernism'. For most other critics, even the *problem* of this relation hardly exists. What we find, instead, in most cases, is that postmodernism, in one variant or another, has been imbibed already as the self-evident politics and procedure, and what remains to be done is the selection, appropriation and interpretation of the texts that are to be included in, or excluded from, the emerging counter-canon of 'Third World literature'. It is in this space of overlap that Salman Rushdie makes, most forcefully, his mark.

That the author himself wants his three major novels thus far (*Grimus* is minor and, in some fundamental ways, both obscure and different) to be read as 'Third World' texts is made obvious enough in the main lines of thematics and plotting, and in the emphases that Rushdie has underscored whenever he has spoken in his own voice, whether within the novels or in the interviews and conference papers which have inevitably followed: the colonial determination of our modernity, the conditions and corruptions of post-coloniality, the depiction of the Zia and Bhutto periods in Pakistan as emblematic of Third World caudillos and dictators, in general, myths of nationhood and independence, the myths and gods of India, Third World migrants in metropolitan cities, the world of Islam, and so on. The forms of narrativisation, meanwhile, are diverse enough for critics to conjecture that they belong, in essence, to a generally non-Western, specifically Indian form of non-mimetic narration, derived, finally, from the

emphases, in the words of Raja Rao, the characteristically Indian penchant for obsessive digressions and the telling of an interminable tale. This is of course what Rushdie's own stance in *Midnight's Children* is. It has not been possible, though, to sustain this idea of quintessential Indian-ness in the form of Rushdie's narrative techniques; the lines of descent from European modernism and postmodernism are too numerous. The necessary though often unintended consequence of these approaches—i.e., the preoccupation with Rushdie's portrayal of 'the nation' and 'the Third World' on the one hand; with the digressive self-reflexivity ('Indian-ness?') of his narrative technique on the other—has been the obscuring of his ideological moorings in the high culture of the modern metropolitan bourgeoisie as well as the suppression of a whole range of questions which have little to do with either 'the nation', or 'the Third World' but which I take to be quite central to the basic import of his narratives.

The more fundamental questions shall become clearer as we get to the reading of the novel, but two features of the ideological subtext itself may be mentioned here in passing, so as to illustrate the general ambience of the work. Thus, Rushdie's idea of 'migrancy', for example, which is quite central to his self-representation both in fiction and in life, has come to us in two versions. In the first version, fully present in *Shame* and in the writings that came at more or less that same time, 'migrancy' is given to us as an ontological condition of all human beings while the 'migrant' is said to have 'floated upward from history'. In the second version, articulated more fully in the more recent writings, this myth of ontological unbelonging is replaced by another, larger myth of excess of belongings: not that he belongs nowhere but that he belongs to *too many* places. This is one kind of thrust in Rushdie's work, which appears to refer to the social condition of the 'Third World' migrant but is replete also with echoes from both the literary tradition of high modernism and the postmodernist philosophical positions. But then, alongside this issue of 'migrancy', we also find in *Shame* an actual portrayal of Pakistan—and, in Rushdie's own words, 'more than Pakistan'—as a space occupied so entirely by power that there is no space left for either resistance or its representation; whoever claims to resist is enmeshed already in relations of power and in the logic of all-embracing violences. This one can see in numerous minor episodes of the novel, such as the breezy caricature of the armed movement in Baluchistan in the 1970s, in the earlier portions of the book, as much as in the fabrication of the central character, Sufia Zinobia, as we shall seek to demonstrate below. Between these two poles of ideological construction—the individual's freedom, absolute and mythic, that is derived from the fact that he belongs nowhere because he belongs everywhere; and an im-

with violence and corruption that any representation of resistance becomes impossible—Rushdie encompasses, in fact, a whole range of nuances which clearly do not constitute a philosophical unity but which are the very nodal points through which the contemporary (post)modernist literary imagination passes as it negotiates its way out of Pound and Eliot, into the world of Derrida and Foucault. How very enchanting, I have often thought, Rushdie's kind of imagination must be for that whole range of readers who have been brought up on the peculiar 'universalism' of *The Waste Land* (the 'Hindu' tradition appropriated by an Anglo-American consciousness on its way to Anglican conversion, through the agency of orientalist scholarship) and the 'world culture' of Pound's *Cantos* (the sages of ancient China jostling with the princely notables of renaissance Italy, with Homer and Cavalcanti in between, all in the service of a political vision framed by Mussolini's fascism); one did not have to belong, one could simply float through, effortlessly, through a supermarket of packaged and commodified cultures, ready to be consumed. This idea of the availability of *all* cultures of the world for consumption by an individual consciousness was of course a much older European idea, growing in tandem with the history of colonialism as such, but the perfection and extended use of it in the very fabrication of modernism (not just Pound and Eliot, but a whole range of modernists, from Herman Hesse to St John Perse) signalled a real shift, from the age of old colonialism *per se* to the age of modern imperialism proper, which was reflected also in the daily lives of the metropolitan consumers in a new kind of shopping: the supermarket. In the literary imagination of high modernism this idea of cultural excess served, however, as a counterpoint against the far less sanguine notion that the fragmented self was the only truly modern self. Ideas of excess and disruption, of unity and fragmentation, were held in this imagination in a tense balance. If the chief characteristic of the metropolitan supermarket was that entirely diverse products (utensils, fabrics, jewellery, refrigerators, beds) could now be purchased under one roof, while also drawing upon the resources of different countries (Indian textiles alongside Manchester woollens; Persian carpets alongside French hosiery), making available a wide range of personal consumptions in a wholly impersonal setting, the felt experience of the elite artist was that he could now draw upon a whole range of cultural artefacts from the whole world (Indian philosophy, African masks, Cambodian sculpture) but he was also subjected to those same processes of capitalist alienation which were inscribed now not only in the processes of production, to be suffered by the working class alone, but in the very structure of social space as it was reconstituted in the modern city. The collage,

and the Cubist recompositions of perspective were the characteristic responses in the visual arts, and Eliot's *oeuvre* came to occupy so central a position in the literary imagination of the Anglo-Saxon elite—and, in an act of characteristic subordination, in the imagination of the Anglophone colonial elite as well—because he combined this sense of cultural excess with an equally strong invocations of 'Hollow Men' and 'Unreal City'; *The Waste Land*, with its fragmented surface, its polyglot ascription, its multi-cultural list of literary resource and ideological possibility, its malevolence toward working women and the sexuality of popular classes, its aristocratic affiliation, its dazzling technical resolution for the sense of unbelonging and inner ennui, is of course the central document of Anglo-Saxon modernism. In none of the major modernists, however, was the idea of the fragmented self, or the accompanying sense of unbelonging, ever a source of any great comfort, it came, usually, with a sense of recoiling, even some terror. What is new in the contemporary metropolitan philosophies and literary ideologies, which have arisen since the 1960s, in tandem with vastly novel restructurings of global capitalist investments, communication systems and information networks—not to speak of actual travelling facilities—is that the idea of belonging is itself being abandoned as antiquated false consciousness. The terrors of high modernism at the prospect of inner fragmentation and social disconnection have now been stripped, in Derridean strands of postmodernism, of their tragic edge, pushing that experience of loss, instead, in a celebratory direction: the idea of belonging is itself seen now as bad faith, a mere 'myth of origins', a truth effect produced by the Enlightenment's 'metaphysics of presence'. The truth of being, to the extent that truth is at all possible, resides now in multiplicity of subject positions and an *excess of belonging*, the writer not only has all cultures available to him as resource, for consumption, but he actually belongs in all of them, because he belongs in none. As these formulations begin to become the manifest common sense of the metropolitan intelligentsia, dutifully reproduced in the literary productions and pronouncements of 'Third World intellectuals' located within that milieu, one wonders what these cultural positions—(the idea of *origin* being a mere 'myth', the double-ness of arriving at an *excess of belonging* by *not* belonging, the project of mining the resource and raw material of 'Third World literature' for archival accumulation and generic classification in the metropolitan university)—might have to do with this age of late capitalism in which the most powerful capitalist firms, originating in particular imperialist countries but commanding global investments and networks of transport and communication, proclaim themselves nevertheless as being *multi-nationals* and *trans-nationals*, as if their *origins* in the United States or the Federal German Republic was a mere myth

and as if their ability to accumulate surplus-value from a dozen countries or more was none other than an excess of belonging.

If Derridean pressures move postmodernism in the direction of a self-reflexive celebration (one is free to choose any and all subject-positions—beyond all structure and all system, in Edward Said's formulation—because history has no subjects or collective projects in any case), the political implications of Foucault's philosophical position and narrative structure tend not only to re-inforce the impossibility of stable belonging and subject-position but also to bestow upon the world a profound cage-like quality, with a bleak sense of human entrapment in discourses of power which are at once discrete and overlapping, many of which appear to be located in the archaeological layerings of the countless passages from the *ancien regime* to modernity while others (the discourse of sexuality, for example) in perhaps Roman antiquity, but there appears to be none that can be traced to an origin or a purpose or an interest. This history without systemic origins or human subjects or collective sites is nevertheless a history of all encompassing power, which is wielded by none and which *cannot* be resisted because there is nothing outside the fabrications of power—perhaps *ought not* be resisted because it is not only repressive but also profoundly productive. History, in other words, is not open to change, only to narrativisation. Resistance can only be provisional: personal, local, micro, and pessimistic in advance. The enormous archival depth of Foucault's researches and the sumptuousness of his prose, we might add, stand in a peculiar relation to this definition of human possibility: as if the recovery and redefinition of the archive were, in the old humanist sense of the intellectual's vocation, a fundamentally redemptive act, and as if Foucault too believed, along with Whitehead for example, that style was the essential morality of a writer's mind.

I do not mean to suggest that *Shame* is somehow a fictional fabrication derived from these sets of ideas which the author then applies to the social reality that engages his attention. Nor is it of any importance whether Rushdie has even read any or all of these other authors (though some phrases in *Shame* are doubtless modelled on phrases from *The Waste Land*). What I wish to specify, rather, is the context of the book's composition as well as reception: the *kind* of author Rushdie is, the whole grid of predispositions which have gone into the making of such an imagination, the kinds of pleasures his book supplies to what was conceived of as its initial readership (Rushdie himself tells us that he wished desperately to win a second Booker Prize, with *Shame*, as he had done with *Midnight's Children*). In some basic ways, one is speaking not so much of Rushdie's intentions as of the conditions of his production, the very saturation of his thought as it were. It is important to recall here that Rushdie was not, until

his recent and macabre sentencing by the Ayatollah, an exile but a *self-exile*. Now, writers-in-exile often write primarily for readerships which are materially absent from the immediate conditions of their production, present only in the country from which the writer has been forcibly exiled, hence all the more vividly and excruciatingly present in the writer's imagination because their actuality is deeply intertwined with the existential suffering of exile and with the act of writing as such. The self-exile has no such irrevocable bond, he is free to choose the degree of elasticity of that bonding, and the material consequences of his migrancy necessarily bring him into a much more accountable relation with the readership which is materially present within the milieu of his productive work. This one recognises not as a weakness or a strength of Rushdie's work but simply as one of its framing realities. This shared ambience between the writer and his primary readership may then be reinforced, or not by ties, or lack of them, that are normally produced by one's own culture, one's own class and the range of choices which are then available and which one exercises for better or worse, in the process of living and writing.

I shall return briefly to these particular moorings and the broader implications of Rushdie's work in the concluding section of the present essay. Before going on any further with such generalisation, however, I want to look more closely at some aspects of *Shame* so as to clarify how these larger issues are embedded in the text of the novel itself. In the process, I shall offer some remarks on Rushdie's self-representation within the book, some more extended remarks on his representation of women in it, and on the implications of these, and of both his 'migrancy' as well as his postmodernist allegiances, for his politics. The intention is not to offer a more adequate or even an alternative reading of either *Shame* or the rest of his growing corpus, less still to deny that the condition of postcoloniality may itself be one of the co-ordinates for reading such books, but simply to illustrate the sort of questions and connections that get marginalised in the pursuit of a generic category of 'Third World literature'.

II

We might as well begin with the author inside the book. For, aside from the numerous things Rushdie has said in the course of his many interviews about his intentions in *Shame*, the narrative within the book itself is controlled transparently by the repeated, direct, personal interventions on part of the narrator—who is, for purposes of our interpretation, Rushdie himself. The first such intervention comes early in the book, as soon as the author is through with his first chapter. After a significant description of his theme—Shame, and what causes it—he comes to himself, his book, his country

I tell myself this will be a novel of leavetaking, my last words on the East from which, many years ago, I began to come loose. I do not always believe when I say this. It is a part of the world to which, whether I like it or not, I am still joined, if only by elastic bonds.²

And

The country in this story is not Pakistan, or not quite. There are two countries, real and fictional, occupying the same space, or almost the same space. My story, my fictional country exists, like myself, at a slight angle to reality. I have found this off-centring to be necessary. I am not writing only about Pakistan.

Then, after a short passage on Khayyam, the Farsi poet, we are told

I too, am a translated man. I have been *borne across* (p. 24, emphasis in the original)

Later in the novel, in the course of a poignant passage about his younger sister, Rushdie would also say, unmistakably about himself

Although I have known Pakistan for a long time, I have never lived there for longer than six months at a stretch. I have learned Pakistan by slices—however I choose to write about over there, I am forced to reflect that in fragments of broken mirrors. I must reconcile myself to the inevitability of the missing bits (pp. 70–71)

And finally

What is the best thing about migrant peoples and seceded nations? I think it is their hopefulness. And what is the worst thing? It is the emptiness of one's luggage. We have floated upwards from history, from memory, from Time.

As we begin to negotiate this imaginative territory marked by 'Pakistan' 'the East seceded nation' etc, it is well to recall what Rushdie himself tells us in a different passage that he had actually gone back to live in Pakistan but had left not because of political difficulty or economic pressure but because he had found the country 'suffocating'. With that personal decision to leave one does not quarrel, because that kind of decision always is personal. But his 'leavetaking' is so very central to his public self-representation as well as to the structure of his fictions that one wants to locate at least the *literary* consequences and precedents—of it somewhat accurately. With regard to his fictions and his general political stance, I think, this personal detail is to be seen not so much in relation to coloniality and its aftermath, nor with reference to the issue of dictatorship *per se*, but in the highly pressurising perspective of modernism itself which has been framed so very largely by self-exiles and emigres—James and Conrad Pound and Eliot, Picasso and Dali, Joyce, Gertrude Stein, and so on—who had experienced the same kind of 'suffocation' in their own spaces of this globe and who were subsequently to leave behind immense resources of genre and vocabulary for delineating that predominant image of the modern artist who lives as a *literal* stranger

in a foreign and impersonal city, and who, on the one hand, uses the condition of exile as the basic metaphor for modernity and even for the human condition itself, and, on the other, writes obsessively, copiously of that very land which had been declared 'suffocating'. Nor was 'the East', and the itch to say some 'last words' about it, far from the imaginative topography of modernism and Rushdie seems to have taken as much from the many styles and ideologies in which 'the East' had been represented within the larger compass of the modernist moment—the debts of *Midnight's Children* to *Kim* are substantial and Kipling, one might recall, actually belongs within this moment, as does Orwell, and Conrad, coming in the middle is of course one of the masters of it)—as he has taken, on other scores, from García Márquez. Even the increasing insistence on self-exile as a positively enabling experience for writers is by no means new, what is new and decidedly postmodernist is the emphasis much sharper in Rushdie's more recent writings, on the idea of multiple belongings and on the lack of any fundamental pain in dislocating oneself from one's original community. But this too fits because the current metropolitan milieu, with its debunking of any 'myths of origin' and of 'metaphysics of presence' does not really authorise any sustained acknowledgement of such pains.

The remarkable thing about the passages I have quoted above is, in any case, the handling of ambivalences and conditionalities. The irony of 'I tell myself', which is intended so clearly to suggest that what follows is mere self-persuasion, not the truth but a hallucination of truth, is poised so sharply against the power of that phrase 'a novel of leavetaking'—and poised all the more sharply because *Midnight's Children* and *Shame* actually are novels of leavetaking, not from the East surely but, more particularly, first from the country of his birth (India) and then from that second country (Pakistan) where he tried, half heartedly to settle down and could not—that tone of initial self-mockery dissolves quickly into a characteristically modernist use of that particular kind of irony which comes into modernism from its antecedents in romanticism itself and which serves to de-stabilise not only the object of irony but also its author, and which Franco Moretti has quite properly called a 'spell of indecision'. There is a quality of linguistic quicksand in all such passages, as if the truth of each utterance was conditioned by the existence of its opposite and Rushdie seems forever to be taking back with one hand what he has given with the other. The will to take leave is poised against the impossibility of leavetaking: he has been coming loose but is still 'joined'—he is still joined but only by 'elastic' bonds—and he is not sure that he likes the fact of continued joining (joined, 'whether I like it or not') he makes statements but he does not believe in them, the fictive and the real co-exist but do not correspond, not only his text but he, himself, exists 'at a slight

angle to reality'; not his text but *he* is 'translated', 'borne across', the translation occurs not on the semantic but on the existential level. These ambivalences propel him, then, to write a 'novel of leavetaking', about a country which is 'not quite Pakistan' and 'not only Pakistan' but *is*, in the most obvious ways, Pakistan. And the novel is something else, well 'my last words on the East'. An audacious undertaking indeed, wider in some senses than Joyce's in *A Portrait of the Artist As a Young Man*, the book which I think Rushdie quite intentionally invokes and where Stephen, the alter ego of that Irish, colonised author had also set out for self-exile so that, as he puts it in the concluding passages of that other book of leavetaking, "I may learn in my own life and away from home and friends what the heart is and what it feels" and 'to forge in the smithy of my soul the unrequited conscience of my race'.

There is poignancy in them surely, but Rushdie's formulations here are troubling on at least two counts. One is that it is always impossible, even in a work much larger than *Shame*—to say one's 'last words' about anything as amorphous as 'the East', this idea that there is some unitary thing called 'the East' about which some 'last words' can be said is a figment of the orientalist imagination and Rushdie is simply over stating at least his capacities if not also his intentions. That he begins the passage with a suggestion of self-mockery does not really retrieve the banal character of the assertion, since the whole book is replete with all sorts of banal statements about 'the East', including the assertion that the English word 'Shame' falls far short of the Urdu word 'Sharam' because the latter is a sentiment and notion and normative conduct characteristically Eastern, hence exceeding the Western capacities of cognition and linguistic formation 'they live after the death of tragedy we are told while 'we' presumably live in the grip of it. Second, there are remarkable contrasts between Rushdie's declarations and the phrases I have used from Joyce's little work of early modernism. There is in the young Joyce still a sense of 'home and friends', and even an accompanying sense of desolation in having to choose self-exile, there is also an intentionality—a choice however tragic, as well as a full-blooded irony about one's own undertaking and about the kind of rhetoric which frequently accompanies such undertakings, remarkable in all this is the pun on the word 'forge', nor is there any sense that the writer has floated upwards from history, from memory, from Time. Rushdie's stance is different. Pakistan, or India for that matter, is precisely *not* home, neither the joining nor the coming loose has, by now, with *Midnight's Children* behind him, the immediacy of a willed and necessary self-wounding that may require the language of iron and smithy, what we have, instead, is an image of tenuous and possibly flaccid rubber, 'elasticity', and what impresses one about 'I, too,

across' is that someone or something else, perhaps History itself, appears to be doing the translating, the bearing across. It is perhaps the lightness of being that comes from having 'floated upwards from history, from memory, from Time' which makes it possible for the author, then, to mock himself into wanting to say his 'last words on the East', in a parody of the flip confidence that one would encounter later in Naipaul's *Among the Believers* (*Satanic Verses* perhaps can be read more appropriately as Rushdie's version of the world Naipaul there describes, with far greater talent and knowing effect but with very uncanny overlap of stances.) As one returns from that phrase 'last words on the East', to Stephen's 'in the smithy of my soul the uncreated conscience of my race, one senses the impossibility of that floating upward' for anyone, migrant or not, who might have thought of 'migrancy' as personal need, because of the 'suffocation', but might be yet unwilling to make a fetish of his own unbelonging.

Parenthetically I may emphasise that I do not wish to construct this juxtaposition of two texts or rather the two sets of brief quotations as some kind of fixed difference between modernism and postmodernism. If a postmodernist at all, Rushdie is so precisely in the sense that his intellectual and artistic formation is essentially modernist but there are distinct articulations and emphases in which he clearly exceeds that basic formation. I am reminded here of those passages in *Invitation to a Beheading* where he argues that postmodernism is a set of tendencies within late modernism itself and which distinguishes itself primarily by celebrating human inability to experience reality as a totality over and beyond its fragments. The attitude towards (self-) exile would be another such shift, but a shift connected with historically distinct moments within the continuum of metropolises, high culture in the century of modern imperialism.

The East would of course continue to haunt Rushdie for many years after the writing of *Shame*, right up to the present and most likely into the indefinite future. For one thing, self-exile rarely becomes a full naturalisation even when class and culture can be fully shared—as even Henry James was to find out. British racism forecloses the option for people of colour in any case, even for a man of Naipaul's longings and identifications, let alone for Rushdie with his monumental ambivalences about the culture of his origins as well as his activist and oppositional relationship with the culture of official Britain. The writing of *Satanic Verses* on the one hand and the fundamentalist fury that was unleashed against him thereafter, has made vivid the non-elasticity of those bonds in a particularly macabre way, which Rushdie himself nevertheless could not have foreseen at the time when he wrote *Shame*. As regards the reading of that earlier novel in its own setting, however, what

towards (self-) exile in these passages is the connection in Rushdie's utterances between (a) the project of saying some 'last words on the East' (b) the ambition to write at one and the same time about Pakistan and also more than Pakistan ('the East' on the one hand, the typology of dictatorships on the other, as well as post-coloniality in general), (c) the sketchiness of the actual knowledge of Pakistan, and (d) the device of 'off-centring'. His declaration, furthermore, that he has 'learned Pakistan by slices' and must therefore reconcile himself 'to the inevitability of the missing bits', and to reflecting both the known and the not-known 'in fragments of broken mirrors', is at once a defence very early in the book, before the reader has engaged with the greater part of the narrative, against the anticipated criticism that there is much missing from this judgment of the 'last words', as well as a positioning of the author which has both a formal and a political import. The confessed fragmentariness of the experience precludes, for example, the realist option because what realism presumes—at the very least—is an integral experience which includes more than mere slices. The narrativisation of 'slices', in the form of 'fragments of broken mirrors' (the echo from *The Waste Land* here is, I think, intentional) only refurbishes the author's prior disposition toward modernism and postmodernism, i.e. views of the world which would serve to further validate the ontological primacy of the fragment.

But the matter of the 'missing bits' is not so easily settled, purely as a problem begging for a formal resolution. It is at least arguable that no one ever knows his country whole, regardless of how much of one's life is or is not actually lived within its borders: that the imaginative apprehension of totality is always constructed on the basis of those bits and slices of concrete experience which constitute any individual's life, migrant or not; that what eventually matters about any experience, felt or narrated, is not its partiality, because direct experience is always partial, but the quality of the particular bits which constitute it and those others which remain outside the felt experience and therefore outside one's imaginative capacity as well. If one has 'known Pakistan for a long time' and yet because of circumstance, 'learned' it only 'by slices', the question naturally arises: which 'slices' has one chosen to 'learn'? For, if we do not choose our own 'bits' of reality, those 'bits' shall then be chosen for us by our class origin, our jobs, the circuits of our friendships and desires, our ways of spending our leisure time, our literary predilections, our political affiliations, or lack of them. There are no neutral 'bits'—not even of not knowing. What Rushdie seems to know, from the inside, because of his own class origin is the history of the corruptions and criminalities of Pakistani rulers, about these he says remarkably trenchant things, and his desire to disjoin himself from that history

moving. The structure of this limited knowledge, circumscribed as it is within the experience of a decadent class to which he is joined by origin but from which he himself feels wholly alienated, only confirms, however, the world-view implied in his already-existing affiliations with modernism and postmodernism. Neither the class from which the Pakistani segment of his experience is derived, nor the ideological ensemble within which he has located his own affiliations, admits, in any fundamental degree, the possibility of heroic action, between the structure of felt experience and the politico-literary affiliation, thus, the circle is closed. What this excludes—the 'missing bits' to which he must 'reconcile' himself—is the dullness of lives lived under oppression, and the human bonding—of resistance, of decency, of innumerable heroisms both of the ordinary and the extraordinary kinds—which makes it possible for large numbers of people to look each other in the eye, without guilt, with affection and solidarity and humour, and which makes life, even under oppression, endurable and frequently joyous. Of that other kind of life his fictions, right up to *Satanic Verses*, seem to be largely ignorant, what his imagination makes of the subsequent experiences we shall only find out from later work. The infinite bleakness of *Shame*, its cage-like quality, is rooted, in other words, in what it excludes as much as what it actually is comprised of.

III

Virtually everyone has noted, as Rushdie himself has, that *Shame*, which is almost exclusively about Pakistan although a couple of episodes do take place in India, is a much more severe and despairing book, more bleak and claustrophobic, than was *Midnight's Children*. The sense that Pakistan is a cage is already there, in the opening episodes, where the Shakil sisters—the three mothers of the 'peripheral hero', Omar Khayyam—are clustered twice over: first by their father, the patriarch of the macabre mansion, with whose death the book begins, and then by themselves, after their one hedonistic night in which their son is conceived. And this sense of being trapped permeates the whole book, right up to the final denouement where we find that even dictators cannot cross the 'frontier' and escape their cage. In between, Bilquis is trapped in her 'elite actressy manner', her sentimentality, her 'horror of movement', her desire for sons and yet her lack of sons, as well as the crassness of her husband's ambitions, pieties and cruelties; Rani is trapped, likewise, in her own husband's infidelities and the rise and fall of his political career; Sufiya Zinobia—the heroine of the book, 'Shame' embodied—is trapped in her brain fever, her humiliation, and her volcanic urge to violence; her younger sister, Good News Hyder, is a much less substantial being but she too is trapped, first in her super-

ficiality and then, despite the marriage of her choice, in the constant demand on her fertility. The younger sister kills herself, the older kills her tormentors, but the cage never quite becomes anything other than itself.

We shall return to some of these characters presently. But we should first note the contrast with *Midnight's Children*, which had been about India, the country of Rushdie's own cherished childhood. What had given to that earlier novel its narrative amplitude was the connection with autobiography—that baggage of memories that even a migrant, particularly a migrant, must carry. Pakistan, by contrast, is a society Rushdie never knew in those golden years before the uprooting. It is not 'teeming' (Rushdie's word for India, borrowed, significantly, from Kipling) for him with stories, and with the plenitude of life, because, as he himself puts it, he has learned it only in little slices, and because the connection of his own life with that land—the new, moth nibbled land of God, as he calls it—is so very tenuous. It is a country which he knows, beyond very personal affections, only as a polity, and primarily in the grotesqueries of its ruling class. Within the limits of that knowledge, the rage that the book conveys is entirely well-founded. The problem is that the experience of a certain class—rather, a ruling elite—is presented, in the rhetorical stance of the book, as the experience of a 'country'. Far from being about 'the East' or even about 'Pakistan', the book is actually about a rather narrow social stratum, so narrow in fact that Rushdie himself can portray all the major characters in the book as belonging to a single family. This plot-device of turning all the antagonists into relatives is a wonderful technical resolution for reflecting the monopolistic structure of dictatorial power and the very narrow social spectrum within which this power in Pakistan circulates. It also helps him bypass the easy liberal dichotomy between military villains and civilian innocents, they are all of the same stripe. The main difficulty arises not in his portrayal of this structure of power and cruelty at the apex, thus he accomplishes on the whole, superbly. The difficulty arises when this ferocious fable of the state is elided, again and again, in his own recurrent rhetoric throughout the book, with a civil society which is declared to be co-terminal with this state structure, equally deformed and irretrievably marked by its purported civilisation (Islam) and its genetic origin (the partition), more catastrophically wounded than even what Narpaui makes out India to be in his *A Wounded Civilisation*. The rulers and the ruled seem to be joined together, each mirroring the other, in a satanic compact.

Thus, the bulk of the narrative is focused on the careers, corruptions, ribaldries and rivalries of the two main protagonists in the political arena. Reza Hyder, an army officer whose origins and early career are quite different from Zia's but who comes increasingly to resemble him, and Iskander ('Iskv')

Harappa, who is modelled on the personality of Bhutto, the former prime minister. The problem, even here, is that those parts of the book which attempt to create fictional equivalents of the literal facts of recent Pakistani history tend too much toward parody, many of the other parts tend too much toward burlesque. Both the parody and the burlesque are at times delicious, inventive, hilarious, but in re-creating the major strands of contemporary history in the form of a spoof, and then mixing up this spoof with all kinds of spooky anecdotes whose symbolic value is sometimes unclear and often excessive, Rushdie has given us a laughter which laughs, unfortunately, much too often. The fictional equivalents of Bhutto and Zia are such perfect, buffoon-like caricatures, and the many narrative lines of the political parable are woven so much around their ineptitude, their vacuity, their personal insecurities and one-upmanships, their sexual obsessions, the absurdities of their ambitions and their ends, that one is in danger of forgetting that Bhutto and Zia were in reality no buffoons, but highly capable and calculating men, whose cruelties were entirely methodical. It is this tendency to either completely individualise the moral failures of a ruling class (Bhutto, or Zia, or whoever, is a bad character) or to spread them far too widely through society at large (the country was *made* wrong, what else do you expect?), which gives to Rushdie's laughter, so salutary in some respects, the ambience, finally, of the modern cartoon.

It is on this narrative line, and on the thematic gathered around it, that most readings of *Shame* have concentrated. And, with reason. If the book is to be located in the counter canon of 'Third World literature', if it is to be read essentially as a document of post coloniality, a myth of the 'nation', a critique of dictatorship, a fictionalised biography of the Pakistani state, a dissent from the politics of partition and of Islamism, then, surely, *that* narrative, and all other narrative lines converging on that main one, should rightly be the point of focus. Who on the left—and not only on the left—could dissent from the abuse heaped on the likes of Zia etc? We can take infinite pleasure in the inventiveness and eloquence of the denunciations which are because of their justness our own, because we are already preoccupied with the twin myths of the 'Third World' and the 'nation', far too many of us are willing to set aside all sorts of things that the book says about women, minorities, servants, and others who are not of the ruling class. And, it is the pleasure of those wide ranging denunciations which makes it possible, for *The New York Times* let us say to lift the book out of its immediate location and compare Rushdie's achievement in *Shame*, in one breath as it were, with Sterne, Swift, Kafka, Marquez, Gunter Grass. What this particular angle on the book—the primary emphasis on the representation of the 'Third World' and the condition of post coloniality on the one

hand; the tradition of the grotesque on the other—does, however, is that it reads the book back from the author's own declarations and foregroundings, according to etiquettes stipulated by critics and theorists of 'Third World literature'. There is, thus, a certain complicity of a shared starting-point between the author and his critics, generated very largely by the very conditions in which the idea of a 'Third World literature' has arisen and which I have tried to specify elsewhere.¹ This complicity inhibits, then, other sorts of starting points: the issue, in the midst of all the political claims that go back and forth between authors and critics, of Rushdie's own politics and affiliations for example, or his representation of women and the related issue of a possible misogyny, or the aesthetic of despair that ensues both from his over valorisation of unbelonging ('floating upward') and his own location within the modernist trajectories, early and late, which are more than merely formal. These other issues are what I want to briefly address, but I am concerned here mainly with his representation of women, for four reasons: that women occupy so large a portion of all the narratives in the book, that Rushdie has himself drawn attention to this fact in numerous interviews, congratulating himself for these representations; that the issue of misogyny is a central issue in any sort of oppositional politics, and that the absence of any substantial male figures from among the oppressed and oppositional strata in this book—the absence, for example, of the male sections of workers and peasants, political militants, the patriotic intelligentsia—is so complete that it is only by analysing his representation of women that we can obtain any clue as to what his imaginative relation with *all* such strata might in fact be. In other words, Rushdie has so often declared himself a socialist of sorts that it is both legitimate and necessary to see what this book might look like if we were to read it from the standpoint of not socialism, simply some determinate energies of an emancipatory project, i.e. not only in its representation of rulers but also in its representations of the oppressed.

This is by no means an uncomplicated undertaking, for Rushdie is not in the way Orwell always was, a misogynist, plain and simple. Living in the contemporary milieu of the British left, he has not remained untouched by feminism itself, at least in a cerebral sort of way, and he is clearly aware, and quite capable of effective narrativisation, of many kinds of women's oppression in our societies. The complication is of a different order, and politically far more devastating than mere lack of sympathy. It is only after taking into account that structure of sympathy and the kind of politics in which it is embedded that one can proceed to examine the more central issues in his representation of women and then to relate those issues back to the generality of his political positions.

Thus, alongside the stories of Isky and

Reza, which together constitute the main narrative frame, are the tribulations of their wives, Bilquis and Rani. These portraits are drawn far more sympathetically than are the portraits of their husbands, and some of the most moving episodes in the book are associated with these women: the episode, for example, of the fire at the time of the partition which burns away 'the brocades of continuity and the eyebrows of belonging' from Bilquis' vulnerable female body, while she is left with nothing save the 'dopatta of honour' in which she wraps herself as an only refuge; and the other episode, toward the end of the book, when Rani, sequestered once more on her rural estate, takes stock of her life, and embroiders 18 shawls on which she traces, in intricate representational design, the debaucheries and cruelties of her husband's full career. Equally powerful are those last images of Bilquis, whose adult life started with forced, fire-propelled nakedness, shrouding herself at the end, an aged woman with defeated dreams, in black veils, so as to make permanent the distance between herself and the male-dominated world in which she has been caged all her life. Similarly, the episode in which Good News Hyder hangs herself in order to escape the constant, mad demand upon her procreativity is a moving episode, and it corresponds to very real horrors in our society. Even the initial conception of Sufiya Zinobia as one who is struggling to let the Beast out of the Sleeping Beauty is itself in the best tradition of grotesque realism. These are all powerful images. Both Bilquis and Rani are, however, when all is said and done, and quite aside from the insult and neglect they suffer at the hands of their husbands, paltry, shallow creatures themselves, capable of nothing but chirpy gossip (in 'the elite actressy manner'), or inertia or, at best, a tawdry affair with the owner of the local movie-house. They are not even remotely as evil as their husbands, and while Bilquis goes increasingly to pieces, Rani at least, in embroidering her shawls, manages to maintain a sort of dignity. Even hers is the dignity of resignation, however. In general, moreover, what we find is a gallery of women who are either frigid and de-sexualised (Arjumand, the virgin ironpants), or demented and moronic (the 20-odd years of Zinobia's childhood), or dulled into nullity (Farah), or driven to despair (Rani, Bilquis), suicide (Good News Hyder), and sheer surreal incoherence and loss of individual identity (the Shakil sisters). Throughout, every woman, without exception, is represented through a system of imageries which is sexually overdetermined; the frustration of erotic need, which drives some to frenzy and others to nullity, appears to be in every case, the central fact of a woman's existence. What we have, then, is a real disjuncture between particular *episodes* which can delineate quite vivid sympathies for the respective female characters on the one hand, and, on the other, a generalised *structure* of representation in which each of those same characters

turns out to be at least dislikable, frequently repugnant.

IV

The crux of the matter, however, is the characterisation of Sufiya Zinobia, the girl who was supposed to have been a boy, the 'miracle which went wrong', the demented child who was born blushing, and who is Shame personified. She is the one who provides the link between the stark title of the book and its many disjointed, sprawling narratives, and who is at the centre of that marriage between shame and shamelessness which, the author tells us over and over again, breeds the all-enveloping violence; she blushes, we are told, not merely for herself but also, more consistently, for the world at large. In a world of utter evil, where everything that happens should evoke shame but where everyone is entirely shameless, Sufiya Zinobia, this Shame personified, is no mere character; she is presented from the outset as the very embodiment of the principle of redemption, if redemption in this altogether unheroic, unscrupulous world is at all possible.

Initially, of course, her blushes begin at birth, for the simple reason that she, like all babies, was expected to be a boy. This unending shame which begins at birth and hounds all her days on earth might well have been, in a different sort of trajectory, an appropriate metaphor for the way a sense of fundamental female inadequacy, and shame as a specifically female attribute, are sought to be generated in the social processes of gendering. But then two things happen. One is that she gets ill, contracting brain fever, and thus becomes permanently retarded, developing the brain of a six-year old at age 19. Now, the problem with this metaphor of mental illness is that the pressures and processes of gendering, which are social and historical in character, and which impose upon great many women the possibility of deformation and incapacity, but which are open to resistance and reversal by women's own actions, are given to us in the form of a *physiological* insufficiency on her part, and the novel therefore becomes incapable of communicating to us, in whatever grotesque forms, the *process* whereby a woman's intellectual and emotional abilities may be sapped, or regained. We may be charitable and not recount here all the ways in which the fiction of women's physiological insufficiency has been mobilised in the past and present histories of gender politics. At the very least, however, this shift from the social to the physiological forecloses the possibility that the person in question can regain the control of her body, let alone her brain, through her own initiative; reversals of such conditions are rare, and they require the agency not so much of the patient as of doctors and hospitals. That Bilquis, her mother, would henceforth be ashamed of the child because the child is a moron, or that Sufiya herself would become an object of

medical interventions, or even that her marriage would remain sexually unconsummated, begins to make a certain sort of sense within the available social arrangements; we may now preach greater liberality of attitude toward such hapless creatures, but the essential social situation remains intractable and the novel simply fails to recover from this eliding of the social into the physiological.

In the course of the novel, moreover, Sufiya's shame comes to refer less and less to herself (her femaleness; her mental retardation) or to her family (which is ashamed of her on both counts, femaleness and retardation) and gets focused increasingly at the world as Sufiya finds it; she becomes, almost literally, the conscience of a shameless world—a principle of honour, so to speak. This too is somewhat problematic, in the sense that when the complex moral obligations of a social conscience are reduced to the limiting emotiveness of mere shame, and when this shamed conscience is deposited with one who is physiologically incapable of intellection and sustained responsible conduct, the author precludes, by virtue of the very terms that he has established, the possibility that this conscience would be capable of grappling with needs of social regeneration, or even with the sort of decency and daily heroism that countless ordinary people are quite capable of. Rushdie says over and over again, within the novel as well as in the interviews which have followed, that the encounter of shamelessness with shame can only produce violence. Precisely! But violence is not in itself capable of regeneration, and it is doubtful, Fanon notwithstanding, that violence is intrinsically even a cleansing virtue. In other words, the very dialectic—of shamelessness and shame, and their condensation in eruptions of violence—which governs the conceptual framework of the novel is fundamentally flawed and the symbolic values which Rushdie assigns to Sufiya Zinobia simply exceed the terms within which he has fashioned her own existence. The double punning in her name—on the word 'Sufi' and on the name of Zinub, the grand daughter of the prophet of Islam who is quite central to several of the popular strands derived from Sufic Islam—is, in context excessive and merely prankish.

This becomes clear as soon as one recalls the stages in the escalation of her violence. The governing metaphor for these escalations—the Beast emerging from inside the Beauty, while the Beauty herself is anything but beautiful in any conventional sense—is again superbly within the tradition of the grotesque, and the political idea which is inscribed within this metaphor—i.e., a woman's inherent right to be not a doll but a fighter—is equally powerful. One's sense of unease in all this comes, however, from the irrational and spurious manner in which her violence accumulates and what she herself *becomes* (a destroyer of men, fields, animals; a four-legged beast herself) before she reaches her object, namely, the murder

of her husband, the 'peripheral hero', Omar Khayyam Shakil. The first such eruption comes at the age of 12 when she goes out and kills 218 turkeys with a certain orgasmic relish in her unfocused violence: "Sufiya Zinobia had torn off their heads and then reached down into their bodies to draw their guts up their necks". The explanation for it is of course simple enough: "twelve years of unloved humiliation take their toll, even on an idiot" (p 149). And the next eruption is, from the authorial standpoint, equally innocent: on the day of her sister's marriage she tries to do to her brother-in-law what she had previously done to the turkeys, but she manages only to twist his neck permanently out of shape, thus putting an end to his polo-playing career. The explanation is again quite simple: 'a pouring into her too-sensitive spirit of the great abundance of shame' at the circumstances, presumably, in which the marriage was taking place (p 186). An instance of desolation in one case, a sense of honour in the other! But then comes something far more monumental. By then, more years have passed and she has married Shakil who is forbidden to sleep with her and sleeps with Shahbanou, her servant, instead. She rightfully begins to wonder about sex, children, the meaning of marriage itself, and Shakil's treachery; she has, at this point, the brain of a six-year old! One day, out of frustration and anger it seems, she walks out of the house, picks up four men, has sexual intercourse with them, kills them, and comes home with semen and blood on her veils. The central passage in this whole episode is worth quoting:

Shame walks the streets of night In the slums four youths are transfixed by those appalling eyes, whose deadly yellow fire blows like a wind through the latticework of the veil. They follow her to the rubbish-dump of doom, rats to her piper, automata dancing in the all-consuming light from the black-veiled eyes. Down she lies; and what Shahbanou took upon herself is finally done to Sufiya. Four husbands come and go. Four of them in and out, and then her hands reach for the first boy's neck. The others standstill and wait their turn. And heads hurled high, sinking into the scattered clouds; nobody saw them fall. She rises, goes home. And sleeps; the Beast subsides (p 242).

She becomes, in this passage then, the oldest of the misogynist myths: the virgin who is really a vampire, the irresistible temptress who seduces men in order to kill them, not an object of male manipulation but a devourer of hapless men. And in thus discovering her 'true' self, she becomes the opposite not only of that other daughter in the book, Arjumand, the sexless 'virgin ironpants' (Rushdie's version of Benazir Bhutto), but also the opposite of the Muslim male who, in some interpretations of the Islamic *shari'a*, is allowed four wives: what she does to her 'four husbands' is of course somewhat more extreme, perhaps because the backwardness of her mind is more than matched by the enormity of her sexual appetite

as well as her malevolence.

She comes home and sleeps, but it is only a matter of time, obviously, before she escapes again, this time for good, 'because once a carnivore has tasted blood you can't fool it with vegetables any more' and because 'the violence which had been born of shame... now lived its own life beneath her skin' (p 268). And she does escape, but 'what now roamed free in the unsuspecting air was not Sufiya Zinobia Shakil at all, but something more like a principle... a human guillotine... ripping off men's heads' (268-70). Soon enough, she ceases to be human even in a literal sense and becomes, of all things, 'a white panther' with a 'black head, pale hairless body, awkward gait'; 'stories about her... had begun to come from all over the country' (p 280). And her achievements:

Murders of animals and men, villages raided in the dark, dead children, slaughtered flocks, blood-curdling howls (p 280)... The killings continued: farmers, pie-dogs, goats. The murders formed a death-ring round the house; they had reached the outskirts of the two cities, new capital and old town. Murders without rhyme or reason, done, it seemed, for the love of killing, or to satisfy some hideous need (p 287).

What the author takes to be the meaning of all this dawns, improbably enough, upon Omar Khayyam Shakil, her husband who was also her doctor and who had been until then nothing but shamelessness personified:

For the first time in her life...that girl is free. He imagined her proud; proud of her strength, proud of the violence that was making her a legend, that prohibited anyone from telling her what to do, or whom to be, or what she should have been and was not; yes she had risen above everything (p 281).

This is of course Rushdie himself speaking; there is nothing in Shakil's character to suggest that he is capable of such an act of imaginative understanding. Yet, there is something profoundly unsettling about this idea of a 'freedom' which resides in rising 'above everything' (earlier in the book, we have already encountered the idea of 'floating upward') and hence being able to commit limitless, senseless violence. And if this is indeed what Sufiya Zinobia has become then it is very difficult, because of the moral perplexity, for a reader to sympathise with her in that last episode of the book where she finally manages to kill Omar Khayyam Shakil himself. By then, it is no longer a confrontation between shamelessness and shame but, rather, between a man who is of course clearly a moral cripple, and a woman who has become, not in the metaphorical but in the most literal sense, a beast.

This portrayal of Sufiya Zinobia, combined with that of Bilquis and Rani which we have discussed earlier and that of Arjumand ('virgin ironpants') which we have not had the opportunity to discuss at any length, raises a fundamental question about Rushdie's view of the world in general and

of women in particular. Considering that Rushdie himself has in his interviews proudly stressed the importance of women in *Shame*, as well as his own conception of Sufia as a principle of honour and redemption, he seems to have fashioned a macabre caricature of what female resistance to cruelties might be; the woman herself becomes, in this version, a rapist. For, so wedded is Rushdie's imagination to imageries of wholesale degradation and unrelieved social wreckage, so little able is he to conceive of a real possibility of regenerative projects on part of the people who actually exist within our contemporary social reality, that even when he attempts, toward the end of the novel, to open up a regenerative possibility, in the form of Sufiya's flight—and also her return, as nemesis and all-devouring fury—the powers which he, as author, bestows upon her in the moment of her triumph are powers only of destruction. It is indicative of the temper of the whole novel that even her innocence, up to the point where she remains innocent of the social corruptions of Rushdie's imagined world, is the innocence merely of the mad and the mentally retarded; she is doubtless the only one who finally obtains the energy to oppose and win, but this energy is itself rooted—literally, the novel tells us—in brain fever. Her power is, moreover, not only purely destructive but also *blind*; even before she takes her revenge upon her tormentors, she has been on the prowl, we are told, through all the nooks and corners of the country, eating up animals and men, destroying fields, creating terror. This kind of image, which romanticises violence as self-redemption, has of course no potential for portraying regenerative processes; it is linked up, further, in a most disagreeable manner, with imperialist and misogynistic myths: the image of freedom-fighter as idiot-terrorist; the image of a free—or freedom-seeking—woman as vampire, amazon, man-eating shrew.

What the characterisation of Sufiya Zinobia illustrates once again is the limiting, even misogynistic nature of the typologies within which Rushdie encloses the whole range of women's experience. As I pointed out earlier, there are several episodes in *Shame* where a sense of the oppression of women is obvious enough; in one kind of response one may now pity the victims of this oppression, much in the manner of the liberal bourgeoisie which always pities the poor. It is also possible to concede within some limits, as regards the general structure of his representation of women, that in real life many women have doubtless been driven to madness, violence, phobia, dementia. But women are not, in any fundamental sense, mere victims of history; much more centrally, women have *survived* against very heavy odds, and they have *produced* history. Madness, sexual frenzy, nullity of being, fevers of the brain, have been, by and large, very uncommon; the vast majority of

women have consistently performed productive (and not only re-productive) labour; and, like those men who also do productive work, they have retained with society and history a relation essentially imaginative, visionary, communal, and re-generative. Erotic need has been, for women as for men, often important, but only in rare cases is it the lone desire, outside loves and solidarities of other kinds; work, in any case, has been for the great majority far more central; women are not, any more than men are, mere eroticised bodies. So, there is something fundamentally awry about a system of imageries which over-valorises, when it comes to describing women, the zones of the erotic, the irrational, the demented, and the demonic. There is something fatally wrong, that is to say, about a novel in which virtually every woman is to be pitied, most to be laughed at, some to be feared at least some of the time, but none who may be understood in relation to those fundamental projects of survival and overcoming which are none other than the production of history itself. Satirising the masters is one thing, but it is a different matter altogether to give such chilling portraits—only chilling portraits—of women, in terms so very close to the dominant stereotypes.

Rushdie's inability to include integral regenerative possibilities within the grotesque world of his imaginative creation represents, I believe, a conceptual flaw of a fundamental kind. He speaks, again and again in the book, of a 'country'; but what he gives us is a portrait, by and large, of the cruel and claustrophobic world of its ruling class. That world he seems to know very well, but to think of the portrait of rulers as a portrait of the 'country' itself is an error, I think, not only of politics, narrowly conceived, but also of the social imagination. Hence the remarkable fact that while Rushdie talks constantly of politics, *all* the political acts represented within the matrix of the novel are demagogic, opportunistic, self-serving, cruel, or at least petty. Politics is mostly farce, sometimes tragedy, but it never is capable of producing resistance to oppression, solidarity and integrity in human conduct, or any sort of human community; for all its marvellous humour, Rushdie's imagined world is in its lovelessness almost Orwellian. And that, too, fits. If the political vision of your imagined world does not include those who resist, or love, or act with any degree of integrity or courage, then you *will* conclude, as Rushdie does, in the 'worst tale in history' which comes in the final pages of the book, that it is a country in which brother has been betraying brother for generations! Now, Pakistan's history is of course replete with betrayals, as is India's, but it is this idea of the permanence and pervasiveness of betrayal—the Orwellian idea, in other words, that human beings *always* betray one another—which gives to this book its quite extraordinary quality of lovelessness. For an equally bleak vision of human potentiality,

one would have to go, I think, to 1984 or to Naipaul's *A Bend In the River*. There is, I believe, a connection between this view of the world and Rushdie's way of representing women. This issue of the representation of women, I have argued, is important both because the issue of misogyny is always central to any kind of oppositional project and also because, in the absence of other kinds of representations of any other oppressed strata, the representation of women who *are* there in the book gives us crucial clues as to the general structure of his imaginative sympathies. Two points here are, I think, worth making. One is that any representation of women, whether in fiction or in life, has to do, surely, with gender relations, but also with *more* than gender relations; it is almost always indicative of a much larger structure of feeling and a much more complex political grid. What I have attempted, in other words, is not a sufficient reading of the book but a *symptomatic* reading: the concentration on a symptom which is itself vividly central but one which may also, in the same sweep, give us some understanding of the structure as a whole. Second, politics appears to me to be a matter not so much of opposition as of solidarity; it is always much less problematic to denounce dictators and to affirm, instead, a generality of values, let us say 'the enlightenment', as Rushdie does toward the end of *Shame*—or 'liberty' or whatever—but always much harder to affiliate oneself with specific kinds of praxis, conceived not in terms of values which serve as a *judgment* on history but as a solidarity with communities of individuals, simultaneously flawed and heroic, who act within that history, from determinate social and political positions.

V

Quite aside from other sorts of choices Rushdie might or might not have made, that kind of politics is precluded for him by the very (post)modernist location he chooses for himself and by the extent to which he valorises the experience of 'migrancy' and unbelonging. This is clear enough in *Shame* but is even more visible in more direct, non-fictional kinds of writing. To illustrate this point, I want to look briefly at two pieces of his which I have selected quite arbitrarily: his brief essay on Gunter Grass (*Granta*, no 15), and his succinct, delightful commentary, 'Outside The Whale' in *American Film*, on the recent deluge of movies about the British raj. My choice is arbitrary in the sense that these are neither more nor less representative than several other of his pieces; I chose them because they came soon after *Shame* and because they are short, in some other ways delightfully inventive, and therefore disturbing for their rather flip postmodernist ambience.

The essay on Grass, for example, begins: In the summer of 1967, when the West was—perhaps for the last time—in the clutches of the optimism disease, when the

microscopic, invisible bacillus of optimism made its young people believe that they would overcome some day, when unemployment was an irrelevance and the future still existed, and when I was twenty years old, I bought from a bookshop in Cambridge a paperback copy of Ralph Manheim's English translation of *The Tin Drum*. In those days everybody had better things to do than read. There was the music and there were the movies and there was also, don't forget, the world to change. Like many of my contemporaries I spent my student days under the spell of Bunuel, Godard, Ray, Wajda, Welles, Bergman, Kurosawa, Jancsó, Antonioni, Dylan, Lennon, Jagger, Laing, Marcuse, and, inevitably, the two-headed fellow known to Grass readers as Marxengels... And my passports, the works that gave me the permits I needed, were *The Film Sense* by Sergei Eisenstein, the 'Crow' poems of Ted Hughes, Borges' *Fictions*, Stern's *Tristram Shandy*, Ionesco's play *Rhinoceros*—and, that summer of 1967, *The Tin Drum*.

I have quoted the last two sentences in the passage above ("Like many of my contemporaries..." onwards) simply to convey a sense of the kind of influences and cultural milieux which have gone into making the type of imagination which Rushdie has. Here, though, I am much more interested in the opening statements. The tone is obviously satiric, even sardonic, and the follies listed here are of course not his own but, we are told, the West's. The tone of mockery is designed, meanwhile, to de-stabilise the meaning of the passage itself. Despite this strategem, however, one can detect the tendency to repeat, almost unthinkingly, the commonplaces and even inaccuracies of the metropolis' high culture. It is doubtful for example, that something called 'the West' was, in the summer of 1967, 'in the clutches of optimism'; that was the year of the Tet offensive, and at least a part of 'the West' American imperialism for example, was not at all 'optimistic'. It is equally doubtful that 'optimism'—the idea that 'the future still exists', the hope that we 'would overcome some day', the conviction that 'there is a world to change'—is as such a 'disease' (a 'microscopic, invisible bacillus', we are playfully told). To be amused, in retrospect, at the youthfulness of one's own youth is one thing; but to learn from maturity that a visionary relation with reality is itself folly, that literature is an antidote to such follies, is to participate, at least unwittingly, in precisely the kind of quietism which Rushdie himself seems to formally reject, in other parts of this brief essay and in many other of his writings.

Despair is now, in this age of late capitalism and the aftermath of high modernism, so constitutive a part of the contemporary bourgeois culture, and it is combined so casually with so many sorts of private pleasures, that one forgets, when one comes upon such formulations ('no future' and all that), how bleak a vision of human possibility this type of thinking signifies. And, it is perhaps because of his discomfort with such

bleakness that Rushdie ends the essay, formally, on the word 'hope'. But before we get to that formal ending, we see some other characteristic ways in which Rushdie participates in that cultural ambience. For example, he first speaks of Grass and of himself as 'migrants', in the literal sense of the word, as individuals who were born in one society and have migrated to another; on this score, he says some very perceptive things. But then he goes on to extend the meaning of 'migration' to a universal ontological plain: 'we are all migrants', he says, in the sense that 'we all cross frontiers'. That too is true, though in a very banal sort of way. The problem, however, comes when, having defined 'migration' as a metaphor for the human condition as such, he goes on to say that a migrant is 'a metaphorical being' and that 'the migrant intellect roots itself in itself' because it understands 'the artificial nature of reality'. Now, if a migrant is a metaphorical being, and if 'we are all migrants', then, obviously, we are all 'metaphorical beings'; and reality itself is 'artificial' then not only in the sense that much of it is *made* by us but also in the much more idealistic and modernist sense that life does not exist outside its metaphors; and if reality is only 'artificial' ('artefact' is another word Rushdie uses in this context), then, obviously, the writer's intellect has no choice but to 'root itself in itself'; the tie between social despair, a literal loss of reality, and narcissism is now complete. Within these ideological predicates, what kind of 'hope' does one speak of, when one does end one's essay on that word? Here, too, Rushdie's own words, in the two sentences which precede the sentence of 'hope', are significant:

The composition of elegies is indeed one of the proper responses for a writer to make when the night is drawing in. But outside his fiction, in his political activities and writings, Grass is making a second, and equally proper response. What this work says is: we aren't dead yet.

The presumption is that 'the night is drawing in'; again, there is no future. So far as the writing of fiction is concerned, therefore, one writes 'elegies'. Resistance, such as it is, belongs to other realms; political activities and directly political writings. In other words, art can only be an art of despair; whatever else one does, one does elsewhere. But in that other realm too, all one can say is 'we aren't dead yet'. The presumption again is that the apocalypse, the demonic end of the world, is at hand; we shall soon all be dead, and our laughter, if it is laughter at all, is the laughter of the day before the world ends. One acts, in other words, not because one hopes to change anything but because one is condemned, by existential necessity, to act; we are back to Beckett's formula—"I cannot go on... I'll go on"—which Rushdie himself quotes most approvingly in his other essay, 'Outside the Whale'.

I do not have the space here to offer a detailed reading of that odd essay—odd in

FORM II-A

Form of general notice to be given to the members of the public before making an application to the Central Government under sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969

NOTICE

It is hereby notified for the information of the public that FORBES FORBES CAMPBELL & CO LTD, BOMBAY proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under the sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval to the establishment of a new undertaking/unit/division. Brief particulars of the proposal are as under

| | | |
|----|---|--|
| 1 | Name and address of the applicant | FORBES FORBES CAMPBELL & CO LTD Forbes Building, Charanjit Rai Marg, Fort, Bombay 400 001. |
| 2 | Capital Structure of the applicant organisation | Equity — Rs. — Unclassified Rs. — |
| | Authorised Capital | 484,00,000 |
| | Issued, Subscribed and Paid-up Capital | 424,96,520 |
| 3 | Management structure of the applicant organisation indicating the names of Directors including Managing/Wholtime Directors and Manager, if any | Dr FA Mehta — Chairman & Managing Director Mr N A Soonawala — Vice Chairman Mr D J Madan Mr K S Gaekwar Mr D B Engineer Mr Akbar Hydari Mr Gurcharan Das Mr D S Parekh Mr D N Poonegar — Joint Managing Director Mr D S Soman |
| 4 | Indicate whether the proposal relates to the establishment of a new undertaking or a new unit/division | The proposal does not relate to the establishment of a new undertaking or a new unit/division. However, it relates to the marketing of new products viz variety of Hand Tools, Cutting Tools etc required for Engineering Industry |
| 5 | Location of the new undertaking or a new unit/division | Not Applicable |
| 6 | Capital structure of the proposed undertaking | There will be no change in the capital structure |
| 7 | In case the proposal relates to the production, storage, supply, distribution, marketing or control of any goods/articles, indicate | |
| | (i) Name of goods/articles | Marketing of new products viz variety of Hand Tools, Cutting Tools etc required for Engineering Industry |
| | (ii) Proposed licensed capacity | |
| | (iii) Estimated annual turnover | Rs 2 Crores |
| 8 | In case the proposal relates to the provision of any service, state the volume of activity in terms of usual measures such as value, income, turnover, etc. | Not applicable |
| 9 | Cost of Project | N I L |
| 10 | Scheme of Finance including the amounts to be raised from each source | Not Applicable |

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this Notice, intimating his views on the proposal and indicating the nature of his interest therein

For FORBES FORBES CAMPBELL & CO. LTD

the sense that it is so very good in so many ways and yet, in the last instance, so profoundly marred by Rushdie's aesthetic of despair. One of the oddest things about the essay is that after developing a superb critique of Orwell, particularly of the essay from which Rushdie himself took his title, and after rejecting the political quietism which Orwell recommends in that essay, Rushdie goes on to display not only the same kind of sensibility we find in his Grass essay but also his peculiar ability, which he seems to share with Orwell, to enunciate altogether antithetic ideas in one breath. Thus, one is hard put to know just where he stands intellectually when he says, for example, in consecutive sentences of a single paragraph, that 'we are all irradiated by history, we are radioactive with history and politics, which is history in action' and 'politics is by turns farce and tragedy, and sometimes both at once'. Now, if 'politics is by turns farce and tragedy', and politics is also 'history in action', then what exactly is one saying about 'history which has 'irradiated' all of us'? That we are irradiated with the 'farce and tragedy' of history itself? So, it is only fitting that by the end of that paragraph we find Rushdie quoting, very approvingly, Beckett's formula of 'I cannot go on' etc. Again, the problem is that if that kind of world weariness is where one takes one's final stand, and if history has already been dismissed as 'farce and tragedy', then why on earth does one want to quarrel with 'Orwell'? After all, Orwell too made plenty of room in his writings for what he took to be 'politics' and he too thought that politics was sometimes tragic, more frequently farcical.

VI

This parallel with Orwell is not a minor matter. Now, undoubtedly, a political discussion of Rushdie's work has become extraordinarily difficult in the wake of the terror unleashed against him by Iran's clerical rulers. But in those earlier days when his own life was not so endangered, and as *Midnight's Children* and *Shame* first burst upon the international scene, receiving equal accolades from *New Left Review* and *The New York Times*, one was struck by the fact that not since Orwell had a political writer with a colonial background, and one who had declared himself a socialist, been so equally admired on the right and the left. Alongside the lovelessness of the fictions, the repeated intrusions of a misogynistic streak, and a certain spontaneous belief in the universality of betrayal, which Orwell too had begun displaying since his earliest writings, *Burmese Days* onwards, Rushdie has also deployed that same stance of unbelonging, of the lone individual occupying a moral high ground above the 'chimeras of politics' (Rushdie's phrase), delivering his denunciations of left and right alike: Indira Gandhi, the Pakistani Generals, the Communist Parties, the Naxalites, film stars, pro-

phets, the short-lived banning of *La Pensee*. On certain issues—racism, religiosity, dictatorship, empire, and the like—one could take a position, and one could also in a general way speak of oneself as a man of the left, as Orwell himself frequently did, but there was no actual left, no existing community of praxis, within that world which had given to one's imagination and fictions their energy, with which one felt in any fundamental way bonded, accepting and struggling with the risks and the restrictions and the suffering that such bonding often implies. From all such groundings one had 'floated upward', even as one constantly thrashed about denouncing all, undifferentiatedly, that one had left behind. In an earlier time, right into the heart of modernism, such desolations of the self were still experienced quite frequently as a loss, what postmodernism has done is to validate precisely the pleasures of such unbelonging which is rehearsed now as a *utopia* so that belonging *nowhere* is construed nevertheless as the perennial pleasure of belonging everywhere.

In this context I can do no better than to simply quote a lengthy passage from that old classic, *Culture and Society* which is ostensibly about Orwell but clearly speaks of larger things.

Orwell was one of a significant number of men who deprived of a settled way of living find virtue in a kind of improvised living and in an assertion of independence. The tradition in England is distinguished. It attracts to itself many of the liberal virtues: empiricism, a certain integrity, frankness. It has also as the normally contingent virtue of exile qualities of perception, in particular the ability to distinguish inadequacies in the groups which have been rejected: there is an appearance of hardness (the austere criticism of hypocrisy, complacency, self-deceit) but this is usually brittle, and at times hysterical. Alongside the tough rejection of compromise which gives the tradition its virtue is the felt social impotence, the inability to form extending relationships.

Yet we need to make a distinction between exile and vagrancy: there is usually a principle in exile; there is always only relaxation in vagrancy. The vagrant in literary terms, is the 'reporter'. It is unlikely that he will understand in any depth the life about which he is writing. But a restless society very easily accepts this kind of achievement: at one level the report on the curious or the exotic; at another level, when the class or society is nearer the reporter's own, the perceptive critique.

Now after the Ayatollah's sentencing of him, Rushdie's 'vagrancy' has turned, paradoxically and tragically, into a full-scale exile—even from mainstream Britain. But even that earlier condition of the production of his work need hardly be used to merely deny the breadth of his achievement, which is substantial. What Raymond Williams' remarks on Orwell help us understand nevertheless is the importance, indeed 'the tradition', of certain ways of living which in some

cases—in Orwell's and Rushdie's surely—have been connected with a colonial past but are in no fundamental sense limited or attributable to the colonial experience *per se*. Exile, in the true sense, is of many kinds beside the purely colonial, and it in any case rarely produces an enduring sense of great pleasure. Exile usually has, as Williams points out, a principle, and the principle prevents one from 'floating upward' and denying the pain. Self-exile and 'vagrancy', by contrast, have become more common amongst artists in every successive phase of bourgeois culture since the early days of Romanticism, and as the experience itself has been chosen with greater frequency the sense of celebration and of 'the migrant intellect root[ing] itself in itself' has grown proportionately. It is the palpable presence of this kind of living in Rushdie's work, with its accompanying inability to believe in any community of actual praxis, hence the belief in the universality of betrayal which is lost in those readings of his work which locate it primarily in the problematic of the 'nation' and the 'Third World' even if one ends by complicating that location. Williams' summary evaluation of that 'tradition', with his highly perceptive diagnosis of its particular virtues and failings, would imply, if followed in its full logic, that Rushdie's work is to be located neither in some unified and categorisable 'Third World', nor in some innocent myth of 'migrancy' as Rushdie himself would have it, nor in an empty, postmodernist 'cosmopolitanism', but in a condition which is in some basic ways older, wider, far more extreme.

Notes

[The above is a provisional draft of an essay which is itself part of a book-length manuscript, on some of the thematics of contemporary literary theory which are formulated in the metropolitan countries.]

Money, Output and Price Level

Pulapre Balakrishnan

This paper presents some evidence bearing on the interest-sensitivity of demand for money and the role of money supply in the inflationary process which must be addressed by those who argue for a money-based monetary policy, especially in approaching the problem of inflation

IN a paper¹ entitled 'Money, Output and the Price Level', C Rangarajan has raised certain issues central to the conduct of monetary policy in the Indian economy. I take up the discussion here, among other things presenting evidence which has a bearing on the resolution of the concerned issues. These latter are the interest sensitivity of the demand for money and the putative role of the money supply in the inflationary process.

I

Theoretical Considerations

For two reasons, the interest sensitivity of the demand for money remains a matter of some interest. First, from the point of view of monetary policy, interest sensitivity of money demand provides the monetary authority with a lever on the determination of the equilibrium money stock which would not be available otherwise. This becomes all the more relevant in an institutional setting like the Indian one with features such as the RBI being required by statute to finance the Union government's deficit (net of borrowing from the public), not to mention the requirement placed upon the commercial banking sector to extend loans for certain 'priority' activities. With the banking sector (including the RBI) thus hamstrung as it were, the interest rate becomes an instrument whereby the monetary authority might attempt to control the stock of money in the economy. However, note what is being suggested. It is that the money stock may now be attempted to be controlled by acting on the demand for it, which is quite a different mechanism from what is envisaged under monetary targeting which idea suggests that the problem may be addressed from the supply side alone. Given the institutional structure in India referred to above the latter suggestion strains credulity. Can there be any effective targeting of the base when the best intentions calculations of the monetary authorities can be overruled by a stroke of the Central government's pen? But what of the private sector? Here, even if an interest rate mechanism is proposed as a means of controlling the rate of growth of the supply of money, it cannot be expected to have much teeth in controlling the expansion of credit. To the extent that interest costs are considered working capital costs by firms, in an oligopolistic setting, corporate borrowers are most likely to pass on rising interest costs as higher prices. Surely rising interest costs are no more likely to reduce the demand for credit to the industrial sector than rising materials cost are likely to lead

to firms lowering their demand for the same? However, commercial bank lending to the household sector may of course be expected to be interest-sensitive. Quite simply though, this does not account for such a large proportion, or even quantum, of credit expansion. I have thus far assumed, of course, that the monetary authorities have given us a good enough case for the control of the money stock.

The second of the implications of interest sensitivity of the demand for money is predictive in that now the presumed (constant) proportionality between the money stock and the price level is affected. The Quantity Theory of Money in its pure form no longer holds. Obviously, because the velocity of circulation can no longer be considered to remain unchanged as the stock of money alters. Now, then, the monetarist model of inflation may be expected to not stand up too well. This is so because the interest sensitivity of the demand for money allows for the possibility that now it is the interest rate which is the price that would equilibrate the supply and demand for money. Where the nominal interest rate is administered (as in the Indian case) it would be necessary to take account of the interest rate to predict the price level at any point in time. For monetary policy makers the message should be that the control of inflation cannot be effected via control of the money stock alone since the expansion of aggregate demand is no longer constrained by the volume of real balances. Money and income need not proceed in tandem.²

Finally, in a brief digression, I quote from a recent review³ of Hick's study, *A Market Theory of Money*, "the financial system has now almost evolved into a complex version of Wicksell's 'pure credit' economy in which the only instrument of monetary policy is the rate of interest and in which the liquidity preferences of financial intermediaries, not to mention those of asset holders in general, create premia which separate the rate of interest that the authorities can directly control from those that impinge immediately upon the spending decisions of ultimate borrowers. The premia, moreover, are variable and hard to predict. Their existence hampers the efficiency of the intertemporal allocative mechanism and renders monetary policy unreliable and difficult to implement. This modern variation on an old theme leads Hicks to argue that it is difficult nowadays for monetary policy to cope with inflation (rather than, as in the 1930s, with chronic unemployment)." While the extent to which the financial system in

the Indian economy has evolved is arguable, these Hicksian considerations are not irrelevant to discussions of the role of monetary policy in India. In the Indian context perhaps the real challenge to monetary policy stems from the existence of unorganised money markets where the interest rate is beyond the control of the monetary authorities. This issue has not been discussed before⁴ and I shall not spend any more time discussing it here.

II

Empirical Analysis

(a) INTEREST RATES AND DEMAND FOR MONEY IN INDIA

A widely stated reason for not investigating the interest sensitivity of the demand for money in the Indian economy is summed up by the argument that the practice of administering interest rates in the organised sector of the economy has meant that "a comparatively static spectrum of interest rates was prevalent"⁵ and that the trajectory of interest rates has been step-wise. Of course, in this sense the experience with official interest rates in India is perhaps no different from that with all administered prices. Consider for instance procurement prices in the foodgrains sector. However, that they have been altered in discrete moves is no reason to not consider their influence which is widely believed to be significant, on the supply decisions of farmers and thus on the open market price of grain. There is an analogy here to a practice of not devoting sufficient analysis to the role of interest rates in the money market. In any case, while discrete movement in the data series is indeed a nuisance from the point of view of an econometric investigation, the 'static' nature of the spectrum of interest rates is not really relevant to the question of the interest sensitivity of money demand. Strictly, what matters is the interest differential between money (defined as earning zero interest) and interest earning financial assets. The 'spread structure', as it were of interest rates among financial assets does not impinge upon the phenomenon of liquidity preference. Presented below are estimates of the demand for money in India.

Narrow and broad measures of the money stock, and short term and long term rates of interest, were used in alternate runs. The inclusion of the current inflation rate led to none of the other current-dated variables being significant, which was considered implausible. Estimates of the money demand

relation having excluded the inflation rate are presented below:

$$M_1 (m-p)_t = -0.58 + 0.51y_t - 0.16r_t \\ (0.13) (0.13) (0.07) \\ + 0.66(m-p)_{t-1} \\ (0.14)$$

$$R^2 = .96 \text{ see} = .054$$

$$LM \text{ autocorrelation } \chi^2(1) = .002$$

$$M_2 (m-p)_t = -0.54 + 0.56y_t - 0.34r_t \\ (0.21) (0.17) (0.14) \\ + 0.69(m-p)_{t-1} \\ (0.13)$$

$$R^2 = .98 \text{ see} = .060$$

$$LM \text{ autocorrelation } \chi^2(1) = .055$$

(standard errors in parentheses)

N = 29, all variables are in logarithms,

r = one year deposit rate in the case of

M_1 ,

and flat yield on 3 per cent govern

ment 'Rupee Paper' in the case of M_2 ,

(m-p) = real money balances,

M_1 = 'narrow' money currency plus de

mand deposits,

M_2 = 'broad' money M_1 plus time deposits

y = real income

Since the variables have been entered in logarithms, the short run elasticity with respect to the rate of interest of the demand for money can be read off directly. The implied long run elasticities are 0.47 and 1.10 for M_1 and M_2 , respectively. The above estimates of the demand for money in the Indian economy point to a marked interest elasticity with elasticities generally comparable to those in the developed economies. (The negative estimate of the constant is somewhat puzzling.)

Clearly the demand for money is interest sensitive, whichever way one might choose to measure the relevant variables. From the methodological point of view, having discovered an interest sensitivity to the demand for money it would be inappropriate to write down a price level equation justified as the inverse of a money demand function with the interest rate having been excluded. From the policy point of view, surely advocates of monetary targeting must now shed some of their sweetness with regard to its consequences.

(b) MONETARY GROWTH AND INFLATION

An econometric model estimated by Rangarajan is used to undertake certain policy simulations. Among those undertaken is one that claims to investigate, putatively the impact upon prices of a "sustained expansion" in the money supply. Nobody should quarrel with the proposition that *in the long run* (defined for present purposes as a situation in which all stock flow ratios remain constant) the inflation rate must be governed by the rate of growth of the money stock, for unchanging stock-flow ratios imply a constant velocity of circulation of money. However, neither this understanding nor any reference to the stability *per se* of the demand for money (function)

need lead us to believe that the monetarist model of inflation is at all helpful to deal with any given inflationary situation. Clearly the relationship between inflation and money growth logically accepted for the steady state does not preclude other factors driving the price level when the economy is out of it. This leads me to conclude that prior to proposing policy rules for inflation control, models of inflation other than the monetarist one need to be considered and their performance compared with that of the monetarist one. Given that there exists a well formulated literature on the former, not to do so is unacceptable. Elsewhere, I have constructed a test of alternative models of inflation for the Indian economy contrasting the widely accepted version of the monetarist model with what may be termed the 'structuralist' explanation of inflation according to which inflation is driven by the relative price of agriculture and the price of imported inputs. Not only does the latter variance dominate (with standard error of estimate half that of the former) but in a direct statistical juxtaposition⁸ the structuralist model rejects the monetarist one without being rejected in turn. I shall not however proceed to analyse this result here. Instead I present evidence of a different nature which is equally interesting and particularly important in the interpretation of Rangarajan's simulation results. It pertains to the direction of the influence in any relationship that may exist between money and prices in the Indian economy. Why is this relevant here? It is relevant because if it can be demonstrated that inflation influences the rate of monetary growth, even apart from the legitimacy of the theoretical underpinnings of the said simulation, the very consequences of anti inflationary policy based on an attempt to control the supply of money needs to be thought through.

To unravel the nature of the money-inflation nexus in time series relation between monetary growth and inflation in the Indian economy is analysed by means of the 'Granger causality' test. The test is easily explained. Consider the following bivariate relationship

$$Y_t = \Pi_{11} Y_{t-1} + \Pi_{12} X_{t-1} + \mu_{1t}$$

$$X_t = \Pi_{21} X_{t-1} + \Pi_{22} Y_{t-1} + \mu_{2t}$$

where the Π_{ij} are reduced form coefficients and the μ_t are random errors with the usual properties. Now if Π_{12} is non-zero X is considered to Granger cause Y. Similarly if Π_{22} is non-zero Y is considered to Granger-cause X.⁹ The relevance of such a test to the present concerns is the following: if the above is interpreted as a model of money and prices, then it is easy to see that the rejection of the null hypothesis that prices do not Granger cause money implies that the Friedmanian assumption of exogenous money is rejected. F values resulting from the test of whether inflation might have Granger-caused the growth of money are presented in Table I. Since theory cannot help much as regards the likely lag structure, up to two

lags were allowed for. The results indicate that the proposition that inflation Granger-causes the growth of the money supply cannot be rejected.

While the use of 'Granger causality' tests to establish causality in the philosophical sense of the term is methodologically suspect its usefulness in testing a premise of the independence between (two) variables may be somewhat more readily accepted. Thus, the results presented in Table I make it difficult to maintain the view that monetary growth in the Indian economy has been independent of the inflation rate. In the light of this finding two sets of questions assume importance. The first of these relates to our understanding of the inflationary process, a matter that I have already referred to. Where the money stock is not independent of the inflation rate it can no longer be claimed that inflation was caused by an exogenously determined nominal money stock confronting a stable (real) demand for money function. This Friedmanian explanation of inflation must now be at a discount and any attempted resuscitation of an overriding causal role for money must look elsewhere for inspiration. I wish to emphasise that the problem raised is entirely one of what is a legitimate interpretation of the evidence on money and inflation in India. It cannot be treated as "an estimation problem" to be so conveniently circumvented by an appropriate statistical technique such as simultaneous equations methods.

The second level at which the rejection of an autonomous growth of the money stock becomes important is the practical, i.e. at the level of policy. If it is the case that monetary policy has been accommodating in the past (in my view a reasonable interpretation of the pattern revealed by the Granger causality tests summarised in Table I) then it becomes necessary to question the usefulness for simulation of coefficients relating money and prices estimated for the same past.¹⁰ Two reasons can be provided for this querulousness. Interestingly, both were raised in the wake of the New Classical Macroeconomics. The first is best summed by the 'Lucas Critique'.¹¹ To see its relevance here consider the following response to an argument thus far. Well, perhaps monetary policy has been accom-

essentially a control variable and will be set autonomously in the future" Surely this is hopelessly off the mark to the extent that it ignores the possibility that agents' behaviour is regime specific. Once we allow for the latter, the regime-shift implied by the transition to a policy of non accommodative monetary policy may be neutralised to some extent if agents, appreciating the switch, might now begin to economise on money balances. The interest-sensitivity of the demand for money makes this a clear possibility in the case of households. A counterpart response among 'firms' (mostly banks of one kind or the other) in the financial sector could well be financial innovation.¹¹ One can hardly tell a priori what the magnitudes involved might be, but it is a salutary reminder that a Lucasian scepticism might well be brought to what is quite a Lucasian preoccupation really, a money supply rule. The second of the reasons for doubting the usefulness of simulations based on estimates from a period when monetary policy has actually been accommodating is essentially linked to the first. Allowing for private sector behaviour in the context of attempting to reverse an extant policy of passive money introduces the question of the 'credibility' associated with policy pronouncements. When agents are led to believe from past experience ('rational expectations') that the authorities will accommodate they are not inclined to re-orient behaviour to any announcement of monetary tightening. Now faced with unchanged private sector behaviour the monetary authorities are forced to go back to their accommodating ways for fear of bringing about a loss of output. This is the well known problem of 'dynamic inconsistency'. It is normally levelled against discretionary policy but this example must highlight its relevance even to proposals to shift to a rule-based policy regime if discretion has been the norm hitherto. Strangely history appears to count in the most unexpected instances.

III

Conclusion

The results presented here must be addressed by those who argue for a money based monetary policy especially in approaching the problem of inflation. In particular, the empirical underpinnings necessary to inspire confidence in the efficacy of monetary targeting (for whatever purpose) must be established, failing this, any argument for the proposal cannot be considered to have been substantiated. Further I would suggest that if the evidence produced is econometric, as it so often is, it must be in terms of the role/effects of nominal money growth, for this is the variable which we are told needs to be targeted. Levels regressions will not do, some decent theory must be produced and, where alternative explanations exist, the data must be pressed into trying to discriminate between them. More general

view of a rapidly changing financial system in the Indian economy. Concentrating on monetary aggregates may be being simple minded, making a distinction between money and credit is likely to be more rewarding.

- 5 Rangarajan, op cit, p. 838.
- 6 As in Rangarajan, op cit, p. 843. Interestingly, a rare instance of a quite meticulous acknowledgement of this appears in the Report of the Committee to Review the
- 7 It should be possible to test this proposition using the techniques developed to operationalise the theory of co-integrated variables. However, note that establishing that money and the price level move together in the long run (which is the interpretation of co-integration among a set of variables) is far from having established a causal role for money in this relationship.
- 8 A non-nested F test was implemented. See Chapter 5 of my *Pricing and Inflation in India* (1991) forthcoming, Delhi, Oxford University Press. Not surprisingly, it appears that this result would carry over to the case of the budget deficit too so long as it is defined (as in the accounts of the Indian Union) as the uncovered deficit. I refer to the work of Saini in this connection. See K. C. Saini (1984), 'Can Monetary Growth Explain Inflation in India?', *Indian Economic Journal* 32, 61-71. In fact, even the most casual empiricism suggests that the alleged relationship between the budget deficit and inflation hardly reveals itself during the second half of the eighties as we witness a definite shift in the share in output of the deficit (rising on average when compared to the magnitudes registered in the first half of the decade). A colleague appeals to a non-linearity in the relationship between the deficit and the inflation rate and points to the (ultimately as it were) definite rise in the inflation rate in the year 1990-91. To my mind, however, this disingenuous argument surely is a case of the money supply man getting by with a little help from Saddam Hussein!
- 9 I deliberately avoid using the expression 'im pact' of money on prices for this interpretation can only be legitimised by a maintained hypothesis that nominal money is independent of the price level (and this we have seen may not be entirely appropriate).

Lopsided Growth

Political Economy of Indian Development

by Pradhan H. Prasad

This collection of essays in political economy unravels the forces which have acted as a drag on Indian development. The Achilles' heel of Indian development plans the author argues, has been their preoccupation with investment planning to the neglect of institutional transformation. Within this broad framework the author discusses a wide range of subjects including macro-economic plan models, choice of techniques, the persistence of outmoded production relations in agriculture, growing political assertion by the middle peasantry, roots of agrarian violence and uneven regional growth.

The Ethnographer and the People

Reflections on Field Work

Vinay Kumar Srivastava

Once it is agreed that a society should be studied as a whole for contextualising a specific problem, field work for the ethnographer becomes an experience of undergoing nativisation in a different culture, with a different set of people. In such situations an episodic narration of encounters with respondents and the actions they carry out 'naturally' is a matter of anthropological reflexivity which an ethnographer should undertake in order to identify the impediments in the process of doing field work, to describe the strategies adopted for establishing relations with the people and, above all, to outline the process in which the self is comprehended in the background of the other. This paper is such a narrative reflection on field work in Baiga Chak in the Satpura region of Madhya Pradesh.

[The first part of this paper appeared last week.]

X

THINGS settled down after the initial catastrophe. Like the Red Indian family, which consists of a man, his wife, their children, and an anthropologist, the five of us (Raghu, the three students, and myself) were members of Dadar Tola. Raghu's role was limited to helping us in transcribing the audio tapes, a job we did late at night.¹⁴

The Baiga hamlet did have some Gond houses, and we often visited them to hear their perceptions of and relations with the Baigas as well as to know something about the Gond way of life. Besides these Gond households in Dadar Tola, a number of Gond boys from other villages, studying in the schools at Charha, were staying in the Baiga houses on rental basis—the rent being paid in cash and/or kind. School statistics revealed that there were seven times as many Gond boys as the Baigas; and this ratio further increased for the Gonds in higher classes. The drop-out rate for the Baigas was very high: domestic responsibility being the chief cause. "The Baigas lack the spirit of entrepreneurship. They still nurture the dream that tomorrow they would be permitted to have *bewar* (shifting cultivation), and although they have been encouraged to adopt settled cultivation, they still feel that their primitive method of producing food is much better. The schools are open for them, but their boys and girls do not come; neither do the parents encourage their children to study", the principal commented when I interviewed him on the facilities available for the scheduled castes and tribes in his school.

Perhaps, he was right. In the course of conversations with the Baigas, they uninhibitedly talked of the 'golden age' when they cultivated twelve types of grains through shifting cultivation; when 'they never had poverty', 'no sickness', and 'were happy'. In other words, they thought that an imposition of the ban on *bewar* cultivation had destroyed their 'free' social life. I was often requested to convey their sentiments to the government so that shifting cultivation might be permitted to them.

The 'officials' had left, and we were

'trying to behave' as the 'people behaved'. Nevertheless being outsiders, we were looked at as "closely allied to the government". Unable to hide our moorings, we had to tell them that we came from Delhi: "Oh! Where Rajiv Gandhi lives; where Indira Gandhi ruled." Having travelled not beyond Bajag, or at the maximum Dindori, the conception of people regarding Delhi was of a "small town where I met Rajiv Gandhi everyday; so after reaching back, I was expected to tell him of demands and sentiments of the people". It was difficult for me to familiarise the people with the 'vastness', 'anonymity', and 'atomism' of Delhi, where we, who seemed to be very important in their situation, disappeared in the lonely crowd—in the big mass of commonality.

It was difficult to convey to the people that we were like small fish in a big ocean. The anthropologists make promises to the people—in weaker moments and chiefly because of their inability to state clearly how 'powerless' they are—to 'do' something for them when they go back to the centres of power, but have a legitimate reason to forget all those promises as then, their involvement is with 'writing', construction of a 'system' out of the vagaries of details. An anthropologist's chief concern is academic, not political; his duty is to understand, and not to change; his goals are definite, where the distinction between the Self and the Other is perpetually kept. If the national political environment is in favour of putting a legalised ban on destroying forests for shifting cultivation, how could an anthropologist impress the tribals' demands on the planners and policy-makers? I have seen how applied anthropologists have failed when it comes to approaching local governments with native needs. Howsoever strongly we may voice the native opinion, the 'natives' are still considered the 'target groups' by the officials, who happen to be their planners and executioners of change.

XI

Dadar Tola had some well known shamans and healers, with their clients com-

ing from several villages. Ghoran, Bazari Lal, Daku, Assam Lal were the famous *bunia*. "Why were you named Daku?" I asked the shaman having this name, because his name meant 'dacoit'. "I was born the day the 'doctor' visited our village", Daku replied. Bazari Lal was named thus because the day of his birth coincided with the market (*bazaar*) day. Assam Lal was born in Assam, when his parents, he remembered, were forcibly taken to work in the tea gardens.

A boy born on Sunday would most probably be named Itwari; one on Monday (Somwar) might be named Somu; and so on. The girls are named similarly by suffixing *iya* after the proper name. So, the birth of a girl coinciding with the doctor's visit would end up naming the child as Dakiya, or if the forest guard happened to visit that day, the baby's name would be Jangaliya, similarly Sorniya, Mangaliya, Budhiya, etc, would be the names of the girls depending upon the days of their birth.

The dependence of the Baigas on the other 'castes' of their village like Gond, Panka, and Dhoba was expressed more in ritual terms. If there existed a high mortality rate of children in a Baiga family, it would immediately give a new-born to the other caste for adoption, and after a couple of months the Baiga child would be taken back. It is believed by the Baigas that a child adopted out would remain unaffected by the nefarious spirits (*jind, masan*). Once the child is taken back from its foster parents, it would be named according to the caste it was adopted into: so, a child ritually adopted by Gond parents would be named Godu (if female, Godiya); by the Panka family, Panku (or Panika); by the Dhoba, it would be called Dhobu (or Dhobiya). Although new names—some of them highly Sanskritic—have been acquired by the Baigas, the old practice of naming still continues.

XII

All the shamans of Dadar Tola were equally philosophical and knowledgeable, and they practised their lore with great con-

who having been rejected by the dispensary imparting Western medicine, received successful cure from the shamans. The latter invariably diagnosed the cause of sickness in the intrusion of one or more foreign bodies and spirits. But of all the shamans, Ghoran was the most vocal, reflective, and expressive. He was very proud to be a Baiga, and often expressed it in ethno-centric terms. In various drinking-sessions that were held at his house, he spoke at length, often in abstract terms, and thus was contributing a great deal to the Baiga philosophy of life. Addressing me, he said, "you come from the plains, where there is 'thin' (*putla*) water and food. We live in 'thick' (*mota*) water and food. You can't adjust to our way, and similarly we'll be unsuited to your way of life." In other words, he made it clear how difficult it was for us to be other-ised, despite our persistent attempts.

Ghoran never hesitated in telling us what he knew about his lore. If he did not know, he expressed his inability in plain words; in anthropological language, he was respondent *par excellence*. My tape-recorder was always ready whenever I met him—either in sessions of divination, or in field, or evenings when he was at leisure. One night I discovered—a painful event for an ethnographer—that the tape deceived me. It failed to record any conversation, which consisted of spells that Ghoran had learnt to de-poison the snake-bite. It was impossible to remember the *mantra*. I could remember the ritual ingredients, but their positioning in terms of space and direction categories was all confused. I still recall how bankrupt I felt at that time. To request Ghoran again for the same pieces of information might irritate him, I thought. The only viable option was to talk to him about the same topic after some days, under the rubric of 'to recapitulate'. After this mishap, I decided to keep my note-book ready, along with the tape-recorder.

The next evening, Ghoran came home after distilling liquor at some undeclared place in the forest. He was slightly drunk, and sat near fire with his maritalateral kin. Smoking tobacco, they were talking about a woman who eloped with a co-villager, leaving behind her children and husband. Ghoran immediately sought the cause of this 'not-too-usual' behaviour in the magic exercised on behalf of her lover by a *gunia*. Taking the cue from their talk, I asked, "Ghoran bhaiya, what is this magic?" "Mohini *mantra*—it can attract any one. Suppose a woman does not like me, but I like her, then I shall go to the *gunia* and request him to instil a likeness in the woman's mind. Once Mohini is exercised, the person on whom the *mantra* is supposed to affect will himself or herself come to his or her lover. Sahib, do you like someone who does not like you?" along came Ghoran's benign smile. Evading his question, I asked him to tell me the *mantra*, and the rituals associated with it. Instantaneously came Ghoran's spirit

"It goes on like this... *Urse mohini, khurse mohini*..."¹⁵ I opened my note-book, and even without being trained in short-hand, I started pacing with him. Ghoran suddenly stopped—I knew he had left the words of the *mantra* incomplete. He gave me a disappointed look, and said, "Sahib, you are a man of power (*rajwale*). You don't do any manual work (*kambuta*). The mud does not stick to your feet. You try to catch everything in 'black letters' (*kala acchar*). Every officer (*babu*) who comes here wants to write about us. But you don't realise that you'll die when the 'air' in you departs. Your body—eyes, nose, mouth—will lie, but the 'air' that makes you 'you' will leave to mix with the 'air' around you. 'Black letter' is nothing before this 'air'; and *gunyai* (healing) works on it. *Mantra* are nothing but the release of 'air'. The 'air' catches the mind and eyes. It curses or cures you." Repenting on my folly, I had closed the note-book, and was apologetically listening to Ghoran's discourse; I did not apply any effort to understand the underlying animism in his ideas.

"Sahib, you should know that there are two supreme mothers: Sun Mai and Kali Mai.¹⁶ Sun Mai controls the voice. Kali Mai controls the 'black letters'. Once they fought. Who is supreme? They could not reach any conclusion. Both said that they were supreme. Finally they went to the almighty (*paramatman*). He said, 'Both of you are powerful. In *mantra vidya* (the knowledge of spells), Sun Mai is supreme. In other matters, Kali Mai is supreme.' So, sahib, you write what we grow; what are our problems; but don't write our *mantra*. Sun Mai will become angry. How can you give the wealth of Sun Mai to Kali Mai? It's the recital of *mantra* that catches everything. It's the word of mouth (*mukhagar*). You learn the *mantra* by reciting with me. You live with me for some years. I shall make you perfect. Then you recite them and relieve the people of their problems. When you write them in 'black letters', the *mantra* lose their effect (*asar*). You, sahib, catch 'black letters'; you never catch the 'air'. 'Black letters' are seen (*prakat*). *Mantra* are never seen; *gunyai* is never seen. It is in 'air', caught by voice, and released in 'air'..."¹⁷

I was dumb-struck. I was found guilty of introducing 'writing' in an arena of culture where it was tabooed; where the oral-tradition had eternal supremacy over its written counterpart. I was reminded of an earlier occasion when in Gadwala village of Bikaner district in Rajasthan, a man of Meghwal caste was narrating the array of thirteen spells that was used to eliminate snake-poison from the body. My tape-recorder was on, and I was patiently listening to him. Every spell in its beginning had names of the Sanskrit gods, and ended with Bismillah-al-Rahman-al-Rahim. The mixing of Hindu and Islamic words of veneration was fascinating, and to note a hypothesis that struck me, lest it be lost, I

The Meghwal stopped for a while, and said "Please don't write the *mantra*. If you write it, it will die!"

Anthropologists specialise in writing, and local traditions—from kin terms to spells—form their subject-matter. There may be an important area of native life, where the people may feel that 'writing' should not be permitted to encroach upon. Whatever may be the reason of keeping this area sacrosanct without contaminating it with 'black letters', as Ghoran said, the anthropologist is caught on the horns of dilemma. Should he write the spells irrespective of the local sentiments? Should he comply with the local beliefs, thus refraining from writing where prohibitions exist? In the first, respect for native culture is negated; and in the second, the ethnography is incomplete.

XIII

Raghu was known to every one in Dadar Tola. He was called by many honorific titles like Mukhiya, Baba, Bhaiya, Samdhu, etc. He knew the anthropological work very well; so, he would rarely speak in interview sessions. Mostly he squatted in one corner—in the daytime, under the sun—and when I needed him, he would come to intervene.

One evening he told me, "Sahib, I have done a lot for the Baigas. I have always tried to save them from oppression (*atyachar*), especially from the forest guards and merchants. I have been instrumental in sending their dance party from Dhurkuta and other villages to the Republic Day celebrations in Delhi. Now, sahib, I want to write a book on them. I like your work immensely. You sacrifice so many things, your comforts, to be with these 'banwasi Baigas' (forest-dwelling Baigas)." The anthropologist in him—inculcated from his first experience with Elwin—was at last emerging. He continued, "But, sahib, something must be done for them. They are very simple, and trust everyone. I will tell you an interesting episode. You know, sahib, these Baigas say that they are the children of Naga Baiga and Naga Baigin."¹⁸ When people who had gone to Assam came back, they told others that there lived Naga Baiga and Baigin in Assam also. Then I looked into the truth of the matter. I told them that in Assam lived the Nagas and not the Baigas." All this inspired me to collect the life-history of Raghu, a work which was done intermittently over a period of many sittings.

But Raghu was not simply content with telling me about his life. He wanted to write his life-history, like me, like any other anthropologist. "During the day, sahib, and in the mornings, I am free. Please buy a note-book for me. I keep a pen with me. I shall write my *jivan charitra*." From then onwards, every day he would tell me the number of pages he had written. Finally, I was handed over a manuscript of 38 pages, titled *Apni Jivan Charitra*. It was obviously a narration

IN WILSON AND CARPENTERS WERE BUILT FOR HIM IN HIS LIFE.

From his autobiographical sketch it was clear that Elwin played a pivotal role in his life. In fact Elwin was his reference individual. Let me quote from *Apni Jivan Charitra*:

I started going to the Mission School, Marfa, on July 1, 1939. After I had spent two months in this school, its owner, Elwin sahib, came to Marfa from Sorwachhapar on a horse. He spent a night in the school. The teachers welcomed him. Next day he took two boys (I was one of them) from the school, and a teacher, Aziz Easai. Then began our journey on foot (*padayatra*). The sahib was on horse. From Marfa, we went to a village called Banjara. We stayed there for the night. The sahib asked the Baigas to sing *karma*. And the sahib also danced with them till twelve at night. Like this journey, we went to Gaura, Dhaba, Kanhari, Rujhni, Sarai, Ajar, Dhurkuta, Kandabani, Silpiri, Tantar, Jeelang, Jald, Bauna, Pipara, Sarai Tharha, Mohli, Kamko, and Samnapur—in total we visited eighteen villages in a period of three months. After this, the sahib took us to Sorwachhapar, and the teacher (Aziz Easai) brought us back to Marfa. From that time on, I started dreaming that once I became an able man, I would also spend my life with these forest-dwelling Baigas, and by becoming Elwin, I would also sing and dance with them.

He further writes:

Some months later, we were again taken on a journey to various places of Baiga Chhak by the sahib. We spent another three months in the Baiga villages. My father came to know about these visits. He thought that the sahib was uselessly taking me on these expeditions. He also feared that one day the sahib would take me to his country. He decided that my studies should be discontinued. My father came to take me away from the school in the month of March 1940 under the pretext of the post winter celebrations (*phag*). Once I came home, he decided not to send me back to the school. I did not like the decision. I was all the time—both in day and night—seeing (remembering) the dances and songs of the Baigas; and the view of the sahib's dancing (*jhum jhum kar nachna*) with the Baigas was simply unforgettable.

And then Elwin came to know about Raghu's absence from the school; he dispelled the misconceptions of Raghu's father. Raghu went back at school. Later on Raghu wrote that when (in 1947) he told his mother that he wanted to spend his life with the Baigas as Elwin sahib did, his mother said, "My son, don't go to the Baigas. They know magic and spells. They also know the potion that kills human beings. Some day they might kill you." But he convinced his mother that the Baigas were extremely nice and hospitable, and like Elwin sahib, he wanted to be with them. Elwin's anthropological interest in the Baigas became Raghu's life-long commitment to them.

Raghu was with us when we visited Tantar. He showed us the place where Elwin built his hut. "Elwin sahib knew the language of

a white sahib could speak their language with fluency. The sahib used *rishta nata* (kin) terms for the people. He talked to them in great detail, asking each and every thing. If he did not understand what the Baigas were saying, he would keep on probing till he was satisfied. He loved dancing with them. He would enter their kitchen, and eat whatever was offered him. Sometimes in the rituals of exorcism, he would take a stick and walk as if the Dev (the 'supernatural power') had entered him. Throughout the hard journey, he never fell ill, except for cold and cough. He loved smoking, and generously gave tobacco to the Baigas. He was very fond of women."¹⁹

I had carried Elwin's *The Baiga* with me to the field. Being involved with the people for the whole day, and then working with Raghu till almost midnight, I hardly had time to glance through Elwin's monograph of 550 pages. Once when I was listening to some episodes from Raghu's life, it occurred to me that a few names in his early description were familiar to me. And I decided to show the photographs of the Baigas in Elwin's book to Raghu, just to freshen his memory of his past friends and elders. He could identify some of them quite well. Moving from one plate to the other, Raghu would state one or the other prominent fact about the person he recognised, such as 'he had two wives', 'he died of TB', 'his children did not survive'.

Gradually, we moved on to the plate facing page 256 of the book. The title of the plate was: 'Bhumia girl with characteristic hemispherical breasts and large sharply defined areolae'. Raghu looked at it; he became grim and thoughtful, and did not utter a word. I asked him if he recognised her. That was the first time in our conversation, extending over so many days, that Raghu did not respond to my question. I quickly moved on to page 264, the plate facing it showed two well-covered Muria and Bhumia girls.

Could Raghu have identified that woman? Was he reminded of a painful experience? Was that woman related to him in putative kinship? What made Raghu quiet? I was puzzled. I repented showing the book to him. After this I was not enthusiastic about displaying the plates to Raghu. Quickly rifling the pages, I asked fewer questions, and Raghu gave briefer replies. After some time he returned to his normal self, and our conversation continued on the same note.

Raghu's pensive quizzed me. I could not muster enough courage to query him. After a couple of days when I found him in a cheerful mood, I gently probed him, "Raghu, what happened to you when you saw the picture of that Bhumia girl in Elwin sahib's book?" Raghu was forthcoming, "sahib, there is one thing I want to tell you. Please don't feel offended. I know how much you admire Elwin sahib. I am also indebted to him. He was a great man. But, sahib, he always wanted to take pictures of

used to call beautiful women of the village with their husbands. He gave them *mohua* (liquor) to drink. Then he told the men he would pay them if they permitted him to take pictures of their wives with exposed breasts. You see, sahib, these Baigas were poor people. Some men agreed to Elwin sahib's proposal. Then they ordered their women to stand or sit with their *pallu* (the part of *dhoti* used to cover breasts) thrown down. The women had to agree. Otherwise their men would beat them." He stopped for a while to measure my reaction, and continued, "sahib, you have seen so many women here. Young, old, married, unmarried. Even a small girl covers the upper part of her body. Some don't wear blouses, but still cover themselves with their *dhoti*. They don't wear a blouse not because they don't want to. They don't have a blouse to wear". And after a pause, he said, "sahib, you remember showing me the picture of that Bhumia girl. She would never walk like that in the village."²⁰

XIV

After disclosing what he initially thought would offend me, Raghu felt 'light', as he told me later. But what made him 'light' made me 'heavy'. Did Raghu lie to me? But why should he? He would gain nothing by disclosing this about a person for whom his respect was unmatched: his yardstick for measuring a 'field worker' was Elwin sahib. As an experienced field assistant, he once advised me, "sahib, you should work like Elwin sahib. His devotion to people was always talked about". And he also remembered giving the same piece of advice to Ray, with whom he worked for six months. In accordance with the anthropological advice to cross-question the informant in case the first set of replies failed to convince the ethnographer, I asked Raghu, at different intervals of time, about Elwin's strategy of seeking erotic pictures. His replies were the same, and his memory had not faded. My efforts to trace old people in this area who could substantiate Raghu's description failed, and I had no option but to treat it as the 'statement of fact' narrated by a person who 'claimed' to have 'worked' with Elwin for a period of six months, in two sessions.

Exoticisation apart, the pivotal intention of an ethnographer is to describe the native life as faithfully as possible, covering every aspect of their synchronous (and, if possible, historical) living. Such a holism encompasses every aspect, including the ones that may be tabooed or secretly guarded in the ethnographer's culture. Thus, sex—being an outstanding cultural fact of man-woman attraction as well as the perpetuation of the species—needs to be documented in its myriad aspects like sexual myths and folklore, sexual postures and symbols, sexual aberrations, etc. notwithstanding the cultural milieu of the ethnographer where sexuality might be brutally suppressed. Thus, if there exist myths of 'vagina with teeth' or local

recorded with all details, however distasteful they may be to the 'puritan' investigator. If there live naked men and women, and the ethnographer thinks that it is just not enough to say that 'the people do not wear anything', the people may be photographed in their 'natural state'. But, if the monograph becomes an 'encyclopaedia erotica', or the 'credulous' and 'simple' people are bribed or persuaded to pose naked for the well-covered people, who would receive pedagogic romanticism and sexual excitement by seeing anthropological photographs and reading anthropological descriptions, it is not only that the virtuosity and trenchancy of anthropological works is marred, but anthropological honesty is also jeopardised.

I believe that honesty in terms of extracting information is cardinal to anthropological work. An anthropologist does not invent the cultural facts, he simply describes them, as plainly as possible. And, then, interrelationship between the battery of facts is sought in terms of what the anthropologist thinks the most heuristically sound paradigm [Clifford and Marcus (eds), 1986]. In the process of collecting facts—and the experiences of people—the ethnographer's subjective predispositions are nothing short of conditioning variables. An ethnographer discovers himself by comparing or contrasting his cultural endowments with those under study. Asking questions and living with the people make him reflective about his own culture. Things people have never thought of, or events they have forgotten are systematically pondered over or remembered, as the case may be, in the company of an ethnographer. Anthropological field work is educating, for the anthropologist as well as the local populace. It is an experience for both.²¹ If there is an inextricable relationship between the personal experiences of the investigator, his personality make-up, the moments of loneliness all ethnographers pass through, the 'objectified' reality amenable to observation, the informations elicited from the people and the events—sometimes horrifying like flood, epidemic, war—which both the ethnographers and the people face collectively, it is difficult to understand how an anthropologist is able to dichotomise his field experience into 'private self' and 'public self', with the former yielding jottings in the diary, and the latter generating 'wealth of data'.

Since ethnography is a joint creation of the anthropologist and the people [Marcus and Fischer, 1986]—it is not the anthropologist *on* the people but it is the anthropologist *and* the people—its first readers should be the people themselves. If the people do not see their pictures—however naked they are—and do not read what is written on them, and thus do not discover themselves in anthropological works, the aim of ethnography as a joint creation stands defeated. We cannot take shelter under the implicit assumption—still

prevailing in some cells of our discipline—that the people we study are 'pre-literate', thus what we write on them is beyond their purview. The consequences of de-colonisation have taught us that neither can we nurture paternalistic attitude towards the people, nor can we assume that the people may never read what has been written on them. If we also think that anthropology can be a guide to action, besides being the mutual interpretation of cultures, the actual actors carrying out the action should be the people themselves. Therefore, it is all the more important that the people share what the anthropologists write about them, in their association and several residual memories.

XV

The Baigas are wonderful dancers. Their dancing team is on the list of probables for the Republic Day celebrations. For entertaining 'officials' coming to their area, the Baiga dancers are sponsored. In their cultural practices also, dancers of one sex of a village visit the other, where they have a whole night dancing session with dancers of the other sex. Although it is customary to wear dancing costumes, we were informed that this more could be easily flouted. Only on 'ceremonial occasions', which also included the entertainment programmes for the 'officials' and other 'big' people, the dancers came properly dressed for the occasion. Dadar Tola had a special site where the dancing sessions took place, but during our sojourn in the village, not a single dancing session was held. Perhaps the inclement weather, the extremely cold nights were partly responsible for keeping the people home.

One day the resident forest officer of Charha asked me, "Have you seen the Baiga dance?" "Not yet, but there is plenty of time. We'll see it some day," I said. "I shall be going to Dadar Tola this evening. Why don't you come along with me?" I seized this opportunity to start a conversation on the attitudes of the forest officials towards the Baigas. "Please meet me around six in the evening," the forest officer fixed the appointment. As scheduled, he came with the two Baiga teachers—Budh Singh Maravi, the first Baiga to be educated, and his second wife's brother, Arjun Singh Dhurve.

Working through 'proper channel' he told the Baiga teachers to help arrange a dance that evening. I told him that in case they had already prepared to dance, we would stay for we did not want them to specially arrange a dance for us. "Let them dance when they want to. Why make them dance just because we are here?" But authority is not accustomed to a negative reply. The Baiga teachers were fully set to marshal the locals for a dance. Perhaps they wanted to please the 'official' and us, or they wanted to 'prove' that they were 'powerful' in every village, in spite of their singular village affiliation.

The message was sent to various houses

in the village during the prospective dancing. A place—the courtyard of a house—was selected for the dance session, and with this began a commotion in the village. I could sense their reluctance. The efforts of the Baiga teachers came to nought, very few people assembled, most of them aged. And no woman came. Frustratingly I told the 'official', "Leave it, let the people rest." "Please wait. They dance every day, they will dance today also," came the reply. My helplessness manifested itself. All this trouble for us! The 'official' mildly reprimanded the teachers, "What is this? Hurry up!"

All those assembled sat around the fire warming their hands and feet. In an hour or so, some young men arrived and on the repeated insistence of the teachers, they brought their musical instruments. Their mental preparedness was conspicuously absent. The elder teacher, Budh Singh, lectured to the assembly, "We have to keep our culture alive. We are famous for our dances, our music, our songs. Our teams have gone as far as Delhi to proclaim that our culture is rich and varied." A man interjected, "But you have always sent people from your village." "That is another matter," Budh Singh continued, "Now if you don't dance, what impression will these sahibs from Delhi carry who have come to meet you?" Then he requested an old man to exhibit his art. He was famous for imitating the sounds of various animals and birds. His mimicry relieved the pent up tension. Peals of laughter shattered the earlier grim quietude. Old durries were spread out for us in the courtyard, but the younger members of our group preferred to sit on the floor. Later a cot was spread for them, as the doctor who periodically visited the village from Bajaj had told us that scabies was very common in these villages. Its mites living in the garments, blankets and bed linens.

The old man's performance increased the preparedness of people and Budh Singh asked the young men to stand up and prepare for *karma*, one of the Baiga dances. The drummer was instructed to start playing. But the women were conspicuous by their absence. Since they formed an essential part of the *karma* dance, word was sent out again. And with great persuasion, six women arrived. Two of them noticeably pregnant. Two had infants tied to their back. One was a middle aged woman, the last was an early teen. Obviously the rigours of the dance would have serious repercussions, I was doubtful and fearful. "Can't we have a dance of the males only?" I asked the teacher. "Don't worry. The Baigas are tough people."

The dance began, and euphoria built up. The lines of the accompanying song were sung first by the male dancers, who held the arms of their neighbours, and then by the women. The rows of the dancers moved hemispherically, and often these groups came in close proximity. Sexual allegories and metaphors were clearly evident in the

words of the song. The teachers also participated, and their vigour was unparalleled.

My heart went out to these women who perforce came to perform, since young, unmarried or newly married, or issueless girls refused to comply. A child fastened to the back of a woman started wailing. The 'official', sitting next to me, was completely oblivious to the aesthetics of dance, he simply wanted to prove that the people danced to his tune. After the first dance was over, I told the senior teacher that we had found it very entertaining and enjoyable and that we would now like to leave. I thought that after our departure, they might stop dancing and the women could then go back to the security of their homes. Budh Singh, the senior teacher, immediately retorted, "Should we assume that you did not like our dance, and therefore you want to leave? Please wait for some more time. The 'heat' of dance is just generating. These Baigas will dance like celestial nymphs (*apsara*)".

It was clear that he was making a distinction between his Baiga self and that of the others. The forest official whispered to me, "The other dances will be the same, the same movements, the same pelvic swinging. If you have seen one, you have seen all." On the insistence of Budh Singh we sat through a number of dances, the sexual allusions in the songs embarrassed me greatly.

XVI

While working on simple societies, anthropologists are keenly interested in accumulating the local material objects for their personal collections or museums. Some of these objects are gifted to them; others are purchased from the local people. I had also acquired a bow and an arrow from a *gunia* of Kandavani, paying him five rupees for both the objects.²² From Silpuri, I got a catapult, again for five rupees. I was also keen to acquire a Baiga necklace (*kanthi*). I asked Raghu if he could request a Baiga to make the necklace for me, and I would pay him for the things needed for the necklace, and also for the labour. Raghu requested a man from Jantar to make one for me, and the 'work' was readily accepted by him.

One morning two men—one old and the other young—came to meet me. The young man was from Jantar, and he had brought the necklace for me. It was beautifully made, and I paid the amount he asked for. The old man, who had come with him, was from Silpuri. He started telling me about his fever which had not abated even after having tried all the available treatments—shamanistic as well as dispensary—since the last two months. When I was talking to him, Raghu also joined us. Of course, both my guests were known to Raghu. The Silpuri man was very vocal, and I thought of talking to him for some more time. In the course of our conversation, he invited all of us to his village to witness a Baiga dance. He also said that every evening they had dancing and

singing in their village. He wanted us to come that very evening. I accepted his invitation, promising to be in his village by the evening. But he said that he would himself take us to his village. After talking to me for a couple of hours, the Silpuri man left to enjoy the rest of the day with Raghu and other people.

In the afternoon the doctor came to Charha on his visit. After finishing his work, he came to call on me. I spoke to the doctor about the illness of the Silpuri man. "You see, professor sahib, these Baigas don't take medicines regularly. They come to us when the sickness advances. Before that they depend on the *guniya*. Venereal diseases are very common in this area. So are dysentery, malaria and tuberculosis. Almost every one suffers from skin ailments. Pregnant women are given iron capsules, but they never take them. The Baigas fear hospitalisation. Once a Baiga was admitted to the Jabalpur hospital. He ran away from there with the glucose bottle. After having traced him in Baiga Chak, we asked him the reason of absconding from the hospital. His reply was, 'How could I have lived there? There was always daylight there. How could I have slept?' As the hospital lights were always on, he thought that that place was without night. So, they are primitive." You kindly advise them to come to us in the initial stages of illness, and take medicines regularly," the doctor churned out the usual medical advice clothed in widely prevalent stereotypes about the people.

In the evening we started for Silpuri. "Should we take something for the people?" I asked Raghu. "Sahib, please buy some packets of tobacco for the dancers and other people," and after a pause Raghu added, "You may also give them *muqaddam* (head man) a token gift of twenty one or thirty one rupees."

It was at least two hours after our arrival in Silpuri that the dance began. The dancers were ceremonially dressed, and there were many female dancers as well as males. I was told that they were 'professional' dancers. More musical instruments accompanied singing and dancing. There was a separate choir of singers. Lanterns radiated bright light. The people were cheerful. It seemed that they really wanted to dance, not for us but for themselves. It was an organised affair, the spontaneity we saw at Dadar Tola was absent here. After every performance the dancers, the musicians, and the singers rested for a while. Most were smoking the tobacco which Raghu had generously distributed on our behalf. Almost every one was drunk, and a heavy smell of *mahua* engulfed my senses and the stench filled my nostrils whenever their lips moved to talk to me. Surprisingly, the teetotaler Raghu had also consumed some liquor, and to conceal this from me he often covered his mouth with the loose end of his *dhot*.

One performance followed the other. In total we were entertained, or the people entertained themselves, with seven dances.

It was certainly not the same repetitive seven times, as the 'official' had told me in Dadar Tola, but each had its specific characteristics and nuances, although the row of male dancers remained distinct from the female, and the drummer always stayed between the two lines of the dancers in all the dances.

Once realising that the dancers were tired, we decided to leave. On Raghu's suggestion, I approached the headman of Silpuri, a young man, thanked him for the excellent performance that we had the honour to witness, and customarily presented a sum of thirty one rupees to him, to be distributed among the dancers. We were about to leave when the man who had extended this hospitable invitation, came to me and said, "Please give some more money to the dancers. After all, they are like your children." I handed over another thirty-one rupees to him, and said, "Please, that's all." But it was not enough. He and also some other men started saying loudly, "We are poor. We have nothing to eat. No one cares for us. Give us more money. We'll be grateful to you." I was encircled by the people. Some men and women were asking the female dancers to approach me—some girls came towards me, palms stretched out, entreating, begging, appealing, "We have danced for you, please give us some money." A couple of them also tried to touch my feet. I was nonplussed, Raghu was trying his best to appease the people, "The sahib is not a Dhanna Seth (a rich man). Kindly accept, all that he is giving you gratefully." While I stood motionless, my hands frozen in the pockets of my coat, and my mind registering incessant plaints for 'more money' in male and female voices, I heard Raghu repeatedly reiterating, "The sahib is a teacher. He has come to live with you. He is not a rich man. He has given you more than his pocket allowed and where are you?" He was looking for the man who had invited us to Silpuri. "Why don't you tell them that you invited the sahib and his group?" Our host, the Silpuri man, came close to me, "Please give them another fifty one rupees, and I shall quieten them." I followed his advice, and we started walking out of the village, perceptibly depressed and upset at this display. As far as I remember, I did not offer my salutations to the people before leaving. Along the way, Raghu profusely apologised for their sudden outburst, at times, he was enraged, threatening to take the matter to the formal body of the Baiga community. I consoled him and tried to quell his agitation, "Don't worry about it. Try to forget all that happened. When you go to Silpuri again, coolly talk to the people about their behaviour. Convince them that their overt display displeased their guests and was undesirable."

XVII

"But are they to be blamed?" I asked myself. Sukh Ram asked for two bottles of *daru* (liquor) in return for information on

now general means are performed. A visitor to Dadar Tola, who came to meet a local healer, asked for a packet of tobacco in exchange for knowledge of how he became impotent after he annoyed one of the local deities. A woman in a house where ear-piercing ceremony was taking place, asked me to buy some bangles for her. Another woman told me, "You ask so many questions, but never give us any money." And I remembered a man in an Oraon village near Ranchi, who asked me for eight annas before he told me how his marriage took place. In all these situations, the ethnographer is miserably placed. He can always put this 'expenditure' under the heading of 'miscellaneous' or the 'rapport-establishment budget', but what does the ethics of an anthropological field work say in this context. How far is it advisable to distribute tobacco to the people to gain friendship? Or, should an ethnographer distribute gifts to gain access to information?

If anthropology is, on the one hand, an interpretation of cultures, it is equally a critique of the development programmes, modernisation, and the inequality that has resulted from them. Much of the 'begging and 'demanding' behaviour of the people owes to the fact that they see an anthropologist as a submissive, nevertheless 'powerful' and 'resourceful' person, but lame in terms of the exercise of 'power'. Along with this relationship between the anthropologist and the people, development has not altered the poverty stricken situations in which the people are placed for decades together. The gains of development are urban-concentrated, little of them flowing to the rural areas, and those which do reach the villages are monopolised by the already existing minority that tends to become richer at the expense of the vast majority. In this situation, the people use this opportunity—of interaction with the outsiders—as one in which some material gains might follow. When they observe that the gains are not forthcoming, unless they make explicit demands, they unhesitatingly state what they expect. If expectations remain unfulfilled, interview sessions may be thwarted, and all doors of information closed to the anthropologist. An ethnographer may go ahead with exchanging 'little' resources (tobacco, liquor, gifts) for 'valuable' data, but, I think, by doing so he makes the task of future ethnographers much more difficult, and also this gives a new orientation to field work where 'power of resources' becomes central to data-collection.²⁴

XVIII

A local 'official' gave me a hand written text on the Baigas. He was certain that his 'book' would be extremely useful for my study. Written in Hindi, it began, "The Baiga people hate telling a lie. Once they open up with you, they do not hide anything. Yes, they are reluctant to talk to strangers

they may go to the extent of closing their doors on seeing an outsider. In case an official comes to their village, their headman makes all the arrangements." And then it went on to describe their beliefs, taboos, their relations with the Gonds, their folklore, dances, and deities. It ended with a poem, titled 'The Dwellers of Forests', which can be taken as a good example of how stereotypic images about the people are idealised. Its English translation could be something like this:

It's neither a town, nor a city
Here live the forest-dwellers,
the gentle and honest Baiga Adivasi
Their food is not urban, (they subsist) on
corn soup and rice
Their faces are always happy
with no streak of gloominess, the gentle
and honest
In the name of cultivation, the Baiga
Adivasi only grow corn and sesame
They spend their life covering half of their
body
By selling labour and wood,
they bring home salt and chilli
They receive closeness from the
government officials
Their relations with the forest department
are family like.
They are counted as the national
property
They sincerely follow the schemes of
the government
They are gentle and honest Adivasi

I had just finished reading this text when Budh Singh came to meet me. Interestingly, he also glanced through some portions of this text, praised the authenticity of information, and immensely liked the poem that 'stress on the Baigas as honest and gentle. "We are gentle and honest. But we are not prepared to change. When I go to various Baiga villages telling the people to send their children to schools, they all say, 'We will'. But when I visit them again, I find that no Baiga boy or girl from these villages goes to school. The schools have been primarily opened for the Baigas, but they don't understand this. I tell them to come out of superstitions and old customs, they never listen to me. You see, my father's younger brother, Moti Lal, was the first Baiga in Dhurkuta village to cut his long hair (*chundi*). This happened in 1952. The caste council (*panchayat*) decided to expel him. Only by giving some bottles of liquor as fine to the council members, he was given back his caste membership (*jat milana*). Now the situation has changed. I tell the boys who are still keeping *chundi* to cut them, so that they look like human beings (*manushya roop dikhien*). The *panchayat* is not so powerful today as it used to be at one time. I tell the parents not to get their girls tattooed all over the body, including the forehead. Tattooing is painful. And also, other castes make fun of us, our practices."

Budh Singh was in favour of furthering Baiga dances and songs, because they kept

the culture alive. However, he was strongly critical of the diacritical marks the Baigas were identified with. The theme of selective continuity has been advocated by various local leaders, cultural practices, looked down upon by the others, are urged to be given up. Often such movements pose paradoxes, which remain unresolved in the enthusiasm of change. For example, the movement towards modernity advises women not to get themselves tattooed, but still the conception of beauty is linked to tattoo marks, and it is also believed that unless the *karma* dancers are tattooed all over their body, they fail to evoke the same aesthetic response. If *karma* is to be preserved, but tattooing prohibited, the whole conception of beauty and self-hood needs to be changed. It is not uncommon even today to hear from the Baiga women: "At least the *gudna* (tattoo marks) is with us for ever, it will go with us after death."

"The doctors don't stay here. The pharmacist is corrupt. If you don't bribe him, he will not give you medicine. All the teachers except Arjun Singh, are outsiders. They are interested in seeking transfer from this place. Budh Singh continued. Unfortunately the development programme for the people is not endogenous. If the local people are picked up and trained in elite institutions of science, arts, medicine, engineering, etc., and then posted to their native areas, there is more probability that they would not only stay without bothering to be transferred, but also take their work and skills seriously. The pangs of ennui and loneliness would be absent once they are with their kin group, caste, and neighbourhood, with which they have multi-stranded relationships. "But educated professionals might always try to leave this forest and settle down in some other town," Budh Singh expressed his doubt when I tried to construct a model of endogenous development before him. "There is no harm in taking the risk, at all it is involved here," my voice was full of optimism. "If there is a Baiga doctor in Chharha dispensary, we may vouch for his commitment more than when the doctor comes here from hundreds of miles, leaving behind his family, relatives, and friends", I hypothesised my conviction. "I agree with what you say. But who will tell the government?" Budh Singh's question was more important. "Why don't you write to the government? Why don't you meet the officials in Bhopal? Please ask them to come here and select the talents from us. We will never shirk from our duties and hard work. Even if the educated Baiga does not come back to his native place, at least he will inspire several others to study. You have to do this for us", Budh Singh had more faith in the anthropologist. After all he saw me 'powerful'—as one who could approach the centres of power with more conviction and stronger voice.

"This meeting with you has been extremely rewarding", Budh Singh congratulated me. "You have come from the city. Still you are

know that every anthropologist talked like this. He continued, "Who cares for the people? You must have been a Baiga in your previous birth," he had couched in the Hindu idiom my anthropological concern for the Baigas.

"Please give me something so that I could always remember you", Budh Singh asked as he was preparing to leave for Dhurkuta.

As a memento of our meeting, I presented the very pen with which I had so far written my field notes and the diary

(Concluded)

Notes

- 14 I was in favour of transcribing all our tapes in the field itself, so that queries and questions, serendipity and hypotheses, that emerged from these could be probed further in the course of stay
- 15 Also, see Elwin [1939: 346-47]
- 16 The literal meaning of Sun Mai is 'mother of hearing', and that of Kali Mai, 'mother of blackness'
- 17 Compare these ideas with that of Plato and Rousseau, see Norris [1987]
- 18 The Naga Baiga and Naga Baigin, according to the Baiga tradition, were the first human beings to be treated after the earth was saved from being engulfed by the demons. Their lore further says that the creation of the Naga couple was to look after the earth—the mother earth. One reason of the Baigas not taking to plough cultivation was that they did not want to pierce the 'breast of the mother earth'
- 19 Raghu came to know that I was interested in collecting information about Elwin's field work. In January 1988, he went to Karanjia to meet an old man of Gond tribe. He gathered a lot of information from this Gond, and prepared a long document titled, *Shri Elwin ki jankari* ('Information about Shri Elwin'). In this document, he describes how Elwin got married to Kosi. An interesting piece of information in this document is that Elwin asked a *gunia* to exercise *mohini mantra* on Kosi Bai, daughter of Partu Baiga.
- 20 Shalina Mehta [1988: 49-50] writes, "For the students of anthropology 'Mandala' and its neighbouring tehsil 'Dindori' have been of significant interest from the time of Verner Elwin. Natives of the region vividly recollect Father Elwin's stay in the 'Baiga Chak' region, where he almost created a home-stead and a kind of mini-complex for himself and his party on the pattern of Baiga living style. There are innumerable tales relating to his exploits during his rendezvous over here, which Elwin himself may like to recollect as imperatives of anthropological investigations or may be to pass it on to untired students of anthropology as 'participant observation'. Local population in fact goes to the extent of identifying as 'Elwin syndrome' by separating children having blue eyes and fair complexion, of whom at least 16 are known to have been identified by the locals"
- 21 To quote Sartre [cf Clifford, 1983], "In fact,

the sociologist and his 'object' form a couple where each one is to be interpreted through the other, and where the relationship must itself be deciphered as a historical moment"

- 22 A few days before our arrival to this village, a wild pig was killed with this arrow, which still had poison on its head. Trying to feel the sharpness of the arrow-head, I touched it, and its owner almost shouted at me, "You should not touch it. It has poison, and may kill you." I immediately washed my hands with soap one of the students carried in her bag.
- 23 Elwin [1958: 180] writes, "On more mundane matters the Baigas are less expert. When the first engine came along the line into the district, a Baiga was found offering it a black cock under the impression that it was some evil spirit. They are almost entirely illiterate." According to a Tribal Research Institute (Bhopal) report of December 1986, the percentage of literacy among them is 4.51.
- 24 In this context, see Das and Parry [1983: 790-91]

Rural Poverty and Its Alleviation in India

N Kakwani

K Subbarao

WE are happy to see a critical scrutiny of our paper [Kakwani and Subbarao 1990] by S Tendulkar and I. R. Jain (TJ for short hereafter) [Tendulkar and Jain 1990].

The measurement of poverty involves a number of conceptual and practical difficulties. Many a time we need to settle for second best methods because of non-availability of appropriate information. For instance, like most other researchers on Indian poverty, we have used per capita household expenditure (PCHE) as a measure of household economic welfare. A better measure of household welfare will, of course, be the per adult equivalent consumption which corrects for the differing needs of adults and children. But this measure cannot be employed in Indian studies because the NSS data are available to researchers only in grouped form (the groups formed on the basis of per capita household expenditure), although the NSS organisation collects the expenditure data for each household. The grouping involves considerable loss of information which may lead to biased estimates of poverty. To estimate poverty from such data, one needs to employ some interpolation device. Most Indian studies have employed a two-parameter lognormal distribution [Minhas, Jain, Kansal and Saluja 1987], with the exception of Ahluwalia (1978) who employs Kakwani-Podder's [1976] Lorenz function. Since the NSS does not regularly correct the income ranges in order to take account of inflation, inappropriate interpolation devices may induce large estimation errors. These errors will be particularly serious when one uses a single density function such as lognormal to the entire consumption range. In our study we used a general interpolation device [Kakwani 1980] which uses a different density function within each consumption range. Although this procedure is an improvement over those employed by previous researchers, it is still the second best solution.

TJ do not seem to recognise these and many other problems associated with poverty research in India. Had they appreciated these, they would have been more constructive in their evaluation of our paper; instead they adopted the negative approach of attacking—wrongly and unfairly in most instances as we shall soon demonstrate—everything in the paper. In what follows, we respond to their criticisms not in the order chosen by them, but in order of the importance of the issues raised by them. These fall into five groups: (a) our choice of price deflators; (b) problems with the decomposi-

tion methodology; (c) growth elasticities; (d) regression results; and (e) other miscellaneous issues including validity of our conclusions.

PRICE DEFLATORS

The central issues raised by TJ are (a) empirical inconsistency in using current prices for calculating Gini and Theil measures; (b) price deflators used by us for measuring poverty are inappropriate; (c) adoption of "conceptually more appropriate" deflators would vitiate our conclusions; and (d) data problems and alleged errors in our estimates of per capita household expenditure (PCHE) growth rates.

We first turn to the alleged empirical inconsistency in using current prices for calculating Gini and Theil's measures of inequality. We used the current prices because both these measures are relative measures of inequality and, therefore, will not be affected if per capita consumption of all households is multiplied by the same price deflator. These indices computed at the current and constant prices will differ only if we assume that households with different per capita consumption have different price indices. The households in the current period can have different price indices if the consumption patterns of households in the base period are different. If these differences are significant, we must compute the price index for each household. The price index of a household with PCHE x in the base period will be

$$I(x) = \sum_{i=1}^n \frac{P_i}{P_0} w_i(x) \quad (1)$$

where $w_i(x)$ is the expenditure share of the i th commodity ($i=1, 2, \dots, m$), which will depend on x and P_0 and P_i are the prices of the i th commodity in the base and current period respectively. Then the real income of that household in the current period, which we denote by x_R will be

$$x_R = \frac{x^*}{I(x)} \quad (2)$$

where x^* is the current per capita consumption of that household. In our study we assumed that $w_i(x)$ is independent of x , which would imply $I(x)$ will be exactly the same as that of x^* .

Following TJ let us assume that households with different income have different consumption patterns or in other words $w_i(x)$ is not independent of x . Then poverty and inequality measures (and also per capita

average consumption) must be derived from the distribution of x_R . To compute these measures, we must rank the households in the ascending order of their real income x_R but the available NSS data are ranked according to the current per capita consumption x^* . If these rankings are significantly different from each other, one cannot do any meaningful analysis of poverty and inequality. Even if the data were available for individual households, we could not construct fractile groups on the basis of the real household income because the households in the base period are not the same as those in the current period. Since we have no access to Jain and Tendulkar's 1989 paper published in the *Journal of Indian School of Political Economy*, we can only wonder how they succeeded in measuring real levels of living for different fractiles. We conjecture, however, that they have constructed the fractile groups on the basis of the assumption that the ranking of households by x_R is exactly the same as by x^* . If so, it would be methodologically a wrong procedure.

Next, we turn to the issue of inappropriateness of our choice of price deflators. This is not a new issue; it was earlier debated by P Bardhan and B S Minhas in the early 1970s. TJ point out that we have used the well established consumer price index for agricultural labourers (CPIAL) for adjusting both the poverty line and the mean PCHE. Recently Minhas, Jain, Kansal and Saluja [1990] have worked out state-specific consumer price indices separately for the total rural population (CPITR) and Minhas and Jain (forthcoming) for the middle range of the rural population (CPIMR). They suggest that the conceptually appropriate deflator for the mean PCHE to be CPITR, and CPIMR for the poverty line. They argue that since we have not used these "conceptually more appropriate" deflators, our findings and hence conclusions are wrong.

At the outset we must point out that when we wrote our paper, the alternative deflators were not available. The Minhas, Jain, Kansal and Saluja paper was published in June 1990 whereas our paper appeared in March 1990. The Minhas and Jain (1990) is still forthcoming. Therefore, TJ criticism for our not using these alternative deflators is unwarranted and unfair. Be that as it may, let us assume that this set of deflators were available to us. How much do we gain (or lose) by using these deflators? Should one choose a set of deflators merely because they are the latest to arrive on the shelf?

While advocating use of two deflators, TJ have not comprehended the empirical and conceptual pitfalls. Their suggestion of course implies that there exist two homogeneous groups of households, which have different consumption patterns. Empirically, how should such groups be formed? One possible suggestion is to use CPIMR for the households which are below

the poverty line and CPITR for those above the poverty line. Minhas, Jain, Kansal and Saluja, [1987] have correctly argued that "methodologically speaking this is not a sound suggestion. The proportion of the people below the poverty line is a variable entity which itself is the very object of poverty measurement"

There are conceptual problems as well. The correct procedure to compute the mean of real PCHE is to find the mean of x_R in (2). TJ suggest that the mean of real PCHE should be computed by deflating the mean of current PCHE (which we denote by \bar{x}) by CPITR, which is given by

$$\bar{x}_R = \frac{\bar{x}}{I}$$

where

$$I(x) = \sum_{i=1}^m \frac{P_i}{p_{0i}} w_i$$

is the CPITR, w_i being equal to the average expenditure share of the i th commodity for the entire rural population. It can be seen that mean of x_R in (2) will be equal to \bar{x}_R only if we assume that $w_i(x)$ is equal to w_i for all i . Thus, TJ's suggestion to compute real PCHE by deflating by CPITR implies that the consumption patterns of all households must be the same, in which case one deflator is good enough direct contradiction to their suggestion to use two deflators.

We have so far examined whether or not it is appropriate to use the recently developed two price deflators. We now address the question whether it is at all necessary to use more than one price deflator. It depends on whether or not the consumption patterns differ significantly across the PCHE ranges. If they do not, the use of one price deflator is justified. It is desirable to test this hypothesis but it is a major undertaking beyond the scope of the present study. Fortunately, Minhas and Jain (forthcoming) have presented the price indices (CPIMR and CPITR) for the middle range and entire rural population, respectively, which throw some light on the issue. The two indices computed by them for the years 1972-73, 1973-74, 1977-78 and 1983 do not seem to differ much as can be seen from their following numerical results at the all-India level:

| | CPIMR | CPITR | Per Cent Difference |
|---------|-------|-------|---------------------|
| 1971-73 | 121.9 | 121.8 | -0.08 |
| 1973-74 | 148.7 | 148.1 | -0.40 |
| 1977-78 | 174.6 | 176.5 | -1.09 |
| 1983 | 282.2 | 283.5 | -0.46 |

Although the differences are somewhat larger at the State level, they are still not large enough to alter the direction of our results or the broad conclusions about poverty and inequality.

It would thus appear neither appropriate nor necessary to use two deflators to convert the nominal PCHE into the real PCHE.

It should also be obvious from the above discussion that while Minhas et al have made a valiant effort to improve the quality of price deflators, the new indices have their own limitations so that our reliance on CPIAL is not entirely unjustified.

This does not mean that CPIAL, the deflator used by us, is the best. A major objection raised against this is that the agricultural labour households constitute only about 30 per cent of the total rural population and the remaining 70 per cent (which include a large number of poor small farmers) may have quite a different consumption pattern. And, therefore, for poverty analysis Minhas et al [1990] have advocated use of CPIMR which is derived on the basis of consumption pattern of the middle income range in the base period. The argument that the CPIAL is inappropriate because it is based on the consumption pattern of only 30 per cent of the rural household population is not that appealing. As a matter of fact, the CPIMR covers only those households which belong to the middle income range which comprise only 20 per cent of the total rural household population. As such a large proportion of the poor is not covered by this index.

Gaiha [1990] argues that CPIAL is the most appropriate deflator for measuring poverty. He makes two points in its favour. First, "agricultural labour households (ALH) are the largest occupational group among the rural poor; not only are the bulk of them poor but they also account for a large share of the rural poor". Second, since "ALH are typically net buyers of food, the CPIAL can be expected to provide a close approximation to the prices confronting the net buyers of food among the rural poor, which would be much larger than the share of ALH among the rural poor".

The most attractive feature of CPITR and CPIMR is that they are based on the consumption patterns observed in more recent years (1970-71) than the CPIAL (1960-61). The principal question therefore is: have the consumption patterns changed so drastically that CPIAL has become unusable? To answer this question, we again refer to the Minhas, Jain, Kansal and Saluja [1990] paper which presents CPITR based on both the weighting diagrams, viz, 1960-61 and 1970-71. We present their results at the all-India level but patterns at the State level are quite similar.

| | 1960-61 Weighting Diagram | 1970-71 Weighting Diagram | Per Cent Difference |
|---------|---------------------------------|---------------------------------|------------------------|
| 1972-73 | 121.5 | 121.1 | -0.3 |
| 1973-74 | 147.6 | 146.7 | -0.6 |
| 1977-78 | 173.9 | 172.2 | -1.0 |
| 1983 | 274.8 | 270.1 | -1.7 |

These results indicate that the price indices do not vary significantly when the weighting diagram for the more recent year is used.

This suggests that the differences in consumption patterns across different PCHE

ranges have little effect on the inference to the calculation of the consumer price indices. One would, therefore, expect the difference between CPIMR and CPIAL to be small because both these indices are based on the same retail prices. The values of these indices at the all-India level are as follows:

| | CPIMR | CPIAL |
|---------|-------|-------|
| 1972-73 | 121.9 | 122.9 |
| 1973-74 | 148.7 | 151.6 |
| 1977-78 | 174.6 | 168.6 |
| 1983 | 282.2 | 267.0 |

It is puzzling to note that the differences between the two indices are quite large for the recent years. The calculations performed at the State level showed even larger differences. How do we explain these differences? Since this is an important issue, it is worthwhile to understand in more detail how Minhas et al [1990] have computed their new indices.

The CPIAL series is constructed on the basis of 62 consumer items, of which 37 belong to the food group, four to fuel and light group, 11 to clothing, bedding and footwear group and 10 to miscellaneous goods and services group. In the construction of CPITR and CPIMR, 62 consumer items were aggregated into 49 items (37 food items, 10 miscellaneous and two item groups, viz, fuel and light and clothing, bedding and footwear). As we do not know why and how this aggregation was done, it will be difficult to evaluate its effect on the price indices. Since the consumption patterns of the 49 items were not available for the 1970-71 year, all these items were further aggregated into 13 major groups (nine relate to food and four to non-food). The prices for each of these major groups were computed using the consumption patterns observed in the 1960-61 year. The State-specific aggregate consumer price indices were then constructed from the 13 major group indices using the consumption patterns of households in 1970-71.

The claim that the proposed indices (CPITR and CPIMR) are the best ones because they are based on the latest representative consumption patterns as the weighting diagram is also not entirely valid because in fact the consumption patterns of households of both years, 1960-61 and 1970-71, have been used. Assuming that the within-group consumption patterns are the same in the 1960-61 and 1970-71 periods, Minhas et al [1990] make allowance for changes in the consumption patterns between the groups. TJ overlook the fact that this is a highly restrictive assumption. One would normally expect that the consumption patterns of households within the groups would change more readily than between the groups. Because of changes in incomes, the substitution of one food item for another food item may be more prevalent than the substitution of food for non-food. Since the within-group consumption pattern is assumed to be the same in the two periods and the between-

stable, it is not surprising to find that the Minhas et al indices do not vary much when calculated using the weighting diagrams of the two periods.

Because the Minhas et al indices are computed on the basis of two weighting diagrams, 1960-61 and 1970-71, their computation of CPIMR is also problematic. Since the income ranges are constructed on the basis of current prices, the households in the middle range in the 1960-61 year may not have the same level of welfare and consumption patterns as those in the middle range of the 1970-71 year. This creates a problem as to which households should be selected in 1970-71 so that they are compatible with those selected in 1960-61. Moreover, CPIAL is the only index available for the most recent years 1986-87 for which the poverty estimates are presented in our most recent version of the paper [Kakwani and Subbarao 1990a].

Before we respond to the next set of issues, we recapitulate the discussion so far. Our use of the CPIAL is perfectly justified; adoption of alternative price deflators as suggested by TJ, even disregarding the numerous conceptual and empirical problems stated by us, would have introduced fresh, unknown (indeed, unknowable) biases into the poverty and inequality estimates; the inferences drawn by TJ (their Table 3) are consequently untenable; there are no errors in our computations and the data problems, we believe, are not serious enough to vitiate our conclusions.

THE DECOMPOSITION

This technique enables one to separate the impact on poverty of changes in average consumption and in its inequality. The pure growth effect is measured as the per cent growth in poverty if the mean PCHE were to change but the Lorenz curve remained unchanged. Similarly, the inequality effect is measured as the per cent change in poverty if the Lorenz curve were to change but the mean PCHE remained constant. Since the poverty measures are non-linear, the total percentage change in poverty will not be equal to the sum of growth and inequality effects. In the *EPW* version, the residual (usually called the interaction term) was combined with the inequality effect. In the recent revised version of our paper [Kakwani and Subbarao, 1990a], we have separated the interaction term from the inequality effect.¹ Again, the direction of the results remained unchanged.

TJ are at pains to drive home the point that this methodology does not permit one to establish causal relationships. It is quite obvious that decomposition is an exact mathematical relationship and, therefore, cannot be used for establishing causality. We have ourselves pointed out this in our paper. Nonetheless, the methodology enables one to draw interesting inferences. For example, the inequality effect tells us whether or not growth in the economy is accompanied by

poor. It should not, however, be interpreted to mean that growth is *causing* a redistribution of income. Even if we do not know what is causing the redistribution, it is nonetheless important to know whether or not growth is *accompanied* by a redistribution. For example, if the relationship between growth rate and inequality effect is found to be significantly positive, we may conclude that the growth process tends to benefit the rich proportionately more than the poor, even if the causality is not known. Since the relationship between growth and inequality is expected to be non-linear (Kuznets 1955), the correlation coefficient which measures the deviations from the linearity may invariably show that the variables are either not related or weakly related. In such situations, the best procedure is to use the rank transformations which have been found to be robust and powerful. In this section, we present results on Spearman's rank correlation coefficient to test whether there exists an association between the two variables. The test statistic where

$$t = \frac{r\sqrt{n-2}}{\sqrt{1-r^2}}$$

r being the rank correlation is distributed approximately as student's t -distribution with $(n-2)$ degrees of freedom. This approximation suggested by Pitman [1937] has been shown to perform better than the usual normal approximation (Iman and Conover 1978). Table 1 presents the correlation coefficients between growth rate and inequality effect and also between growth rate and total poverty effect. The student t value is calculated using 14 degrees of freedom.

The correlations in Table 1 suggest that the association between the growth rate and the inequality effect is positive and significant only in the first period (1973-74 to 1977-78). The relationship became insignificant during the subsequent periods. Thus,

on poverty is supported only in the first period but not in the two subsequent periods. Although the factors that may have contributed to the virtual absence of this relationship in the subsequent periods are difficult to establish empirically, it is at the same time difficult to dismiss entirely the role of anti-poverty interventions introduced in this period especially because the scale and delivery of this effort stood in contrast to the piecemeal efforts of the past.

The correlation between the growth rate and the total percentage change in poverty was found to be negative and significant during all the three periods (with one exception being the poverty-gap ratio for the ultra poor during the 1973-74 to 1977-78 period when the correlation was not significant at 5 per cent level). It implies that a positive growth generally tended to reduce the poverty. Although these observations tend support to the 'trickle-down' hypothesis, anti-poverty interventions may have played an important role in suppressing the adverse effects of income redistribution which might have resulted because of the growth. The impact of the growth without anti-poverty interventions would have been smaller as we observed during the 1973-74 to 1977-78 period.

TJ went to such a great length just to point out that the growth effect is more dominant than the inequality effect. This is quite obvious from our tables. An important observation made in our paper was that the inequality effect was generally positive in the 1973-74 to 1977-78 period but it became generally negative in the subsequent period. Thus, in the first period the redistribution of income increased poverty whereas in the second period it reduced it. Consequently, the proportional reduction in poverty was greater in the second period than in the first period despite the lower growth rate in the second period. It is not

TABLE 1: RANK CORRELATIONS BETWEEN GROWTH RATES IN PER CAPITA HOUSEHOLD EXPENDITURE AND INEQUALITY AND TOTAL POVERTY EFFECTS

| Period | Growth Rate and Inequality Effect | | Growth Rate and Total Poverty Effect | |
|------------------------------|-----------------------------------|---------|--------------------------------------|---------|
| | Correlation | t-value | Correlation | t-value |
| Head-count ratio poor | | | | |
| 1973-74 to 1977-78 | 0.62 | 3.2* | -0.68 | -3.7* |
| 1977-78 to 1983 | 0.33 | 1.4 | -0.75 | -4.5* |
| 1983 to 1986-87 | -0.03 | 0.1 | -0.62 | -3.1* |
| Head-count ratio ultra poor | | | | |
| 1973-74 to 1977-78 | 0.58 | 2.9* | -0.59 | -2.9* |
| 1977-78 to 1983 | -0.02 | -0.1 | -0.83 | -6.1* |
| 1983 to 1986-87 | 0.04 | 0.2 | -0.56 | -2.7* |
| Poverty gap ratio poor | | | | |
| 1973-74 to 1977-78 | 0.66 | 3.5* | -0.57 | -2.8* |
| 1977-78 to 1983 | 0.13 | 0.5 | -0.79 | -5.1* |
| 1983 to 1986-87 | -0.01 | -0.1 | -0.57 | -2.8* |
| Poverty gap ratio ultra poor | | | | |
| 1973-74 to 1977-78 | 0.66 | 3.5* | -0.39 | -1.7 |
| 1977-78 to 1983 | 0.05 | 0.2 | -0.68 | -3.7* |
| 1983 to 1986-87 | -0.06 | -0.3 | -0.53 | -2.5* |

Note: Asterisk indicates that the correlation is significant at 5 per cent level.

clear from TJ's writing why these conclusions do not follow even descriptively from a careful examination of our tables. They repeatedly make criticisms without providing explanation.

The decomposition proposed in the paper has important implications for the 'trickle-down' mechanism which is widely talked about by economists. Unfortunately, TJ dismiss this approach by calling it descriptive or non-causal. They further assert that there are interpretational problems with the decomposition of which we are not aware. The authors make such criticisms without providing any explanation. The only point on decomposition methodology raised by TJ is that depending upon in which year (base or terminal) Lorenz curve is kept unchanged the results can have very different interpretational implications. This is a valid point. The choice of the year is arbitrary. We chose the base year Lorenz curve because we felt that this was a natural choice. If TJ provided a rationale for selecting the terminal year Lorenz curve, we would, of course, adopt it but we believe that there exists no such rationale. It might interest *EPW* readers to note that the same authors have written a paper (June 1990 after our paper was published) using the same decomposition.²

GROWTH AND INEQUALITY ELASTICITIES

TJ argue that the growth and inequality elasticities estimated by us are of no value in the absence of an explicitly formulated economic model incorporating the mechanisms and processes connecting poverty, mean PCHE and relative inequality. We never implied that these elasticities would provide any clues to causality. Our aim in computing these elasticities was more

modest, viz, to examine whether or not there is a temporal tendency for the poverty ratio to exhibit greater (or lesser) responsiveness to changes in growth and inequality. The question 'how' growth was impinging on poverty was never asked. Of course, it would be nice to formulate an economic model which incorporates all the processes concerning poverty but such a model has to be a fully blown general equilibrium model encompassing all the sectors of the Indian economy and their linkages to the foreign sector. We invite TJ to attempt such a model and throw light on causality.

In this context, TJ also point out that the elasticities are point elasticities and, therefore, are conditional upon the points of evaluation which should be kept constant in order to detect true inter-temporal changes. It seems that they have completely missed the meaning of these elasticities. It is true that the Engel elasticities are computed at a given point because they are generally not invariant to the points at which they are evaluated. TJ are extending the same idea to the growth and inequality elasticities. These elasticities are computed from given income or expenditure distributions. They are in fact fixed for a given distribution. Any provided the methodology which can encompass alternative assumptions. It is not clear whether TJ are criticising our assumption or the methodology itself. All economic models are constructed on the basis of some assumptions and, therefore, the conclusions emerging from them are never unambiguous. Thus their criticisms relating to our elasticity calculations are unnecessary.

The final point on elasticities made by TJ is that growth and inequality elasticity cannot be related to growth and inequality effects. This is correct but we have not made

any attempt to relate the two. Elasticities measure the responsiveness whereas effects measure the actual change due to growth and income redistribution. Elasticities are computed on the basis of expenditure distribution for one year only whereas to compute growth and inequality effects we require expenditure distributions in two periods. Both these concepts convey quite different information about the characteristics of poverty. The elasticities are useful for simulating the effect of alternative policies. But it is equally useful to explain the actual changes in poverty. It is puzzling to know what point TJ are making by alleging that we are relating the two concepts. On the basis of the magnitudes of inequality elasticities, we do make two statements: (1) if the inequality deteriorates during the course of economic growth poverty may increase ever, with a faster economic growth because of temporal change in them reflects the changes taking place in the income distributions. It makes little sense to fix a point of evaluation

As pointed out in our paper, the computation of poverty elasticity with respect to inequality is difficult because keeping per capita consumption constant, inequality in distribution can change in infinite ways. To compute this elasticity we need to make an assumption as to how inequality is changing; for instance, whether inequality is increasing by decreasing the share of the poor or increasing the share of the rich. In our paper, we have clearly stated that inequality elasticities are based on a proportional shift in the Lorenz curve and, therefore, are not unambiguous. This assumption may not be acceptable but one can compute these elasticities with alternative assumptions. We have

growth and inequality elasticities are considerably higher for the ultra-poor than for the poor implying that increasing inequality will hurt ultra-poor more than the poor. Then TJ go on to say, "both the statements imply general reduction in inequality and not a particular characterisation used in B". This statement is based on the mistaken impression that we related inequality effects and elasticities. We made no effort to establish causality between growth, inequality and poverty. It seems that TJ have completely misinterpreted what has been said in our paper.

DATA RELATED PROBLEMS

TJ raised two other data related points. They argue that 1977-78 NSS poses problems as it reports unusually high proportion of expenditures on durables at the top open ended class interval. We have no access to their *all India* analysis of this problem, we did, however, look at this problem at the *State-level* and found it relevant only for two States, Maharashtra and Rajasthan, and made appropriate adjustments. It is worth stressing that a judgment on how serious is this problem is essentially a subjective judgment. We believe the problem is more serious in the two States mentioned. The expenditure figures on durables in the other States did not lead us to suspect their accuracy. TJ, however, are right in pointing out that the adjustments made for Maharashtra and Rajasthan in real mean PCHE have not been carried over to our decomposition exercises for period I. This was done in our revised, recent version of the paper [Kakwani and Subbarao, 1990a], and we found no change in the direction of results.

TJ also point out that we have made some calculation errors in computing PCHE. To clarify our position, we only need to repeat the procedure we adopted in computing all India PCHE. We have adjusted the expenditures in current prices for each State for State wise price differences (both over time and across States) and then aggregated to derive all India real PCHE estimates. Our estimates therefore, need not correspond with those all India PCHE estimates derived on the assumption that the price levels in different States are the same each year. Moreover, our all India estimates of the real PCHE are based on the average for 15 States, whereas the published all India tables are averages for more than 15 States. Thus the observed differences in the numerical results are to be expected owing to differences in methodology and coverage they do not reflect lack of care on our part but a lack of understanding on the part of TJ about the procedure we used in estimating all India PCHE.

REGRESSIONS

It is quite obvious from even a casual reading of our paper that regression relationships were not estimated to establish causality. Our purpose was again limited to testing

the hypothesis whether or not there exists a significant association between the variables. If the association is found to be statistically insignificant, it would most likely imply a non-existence of causal relationship. But if the association is statistically significant, it would only mean monotonicity in the relationship between the variables. One would then require further investigation to establish causality. This task could have been accomplished by using correlation coefficients. But we used regressions because they immediately provided us with the t values.

OTHER ISSUES

Finally, TJ object to our use of two point comparisons. It is well known that NSS is now available only quinquennially and one can only compare five-year periods so that, contrary to TJ's hope, there is no way one can get a complete time series for the 1970s and the 1980s. TJ's references to the problems created by the dance of the monsoons is a real one, but we disagree with their view that the years chosen by us are "exceptional years", especially when analysis is conducted at a disaggregated State-level, we also do not see much logic in ignoring observations on the basis of such factors as the rate of inflation. It is worth stressing no two years can ever be "identical years" from the viewpoint of sectoral, macro, fiscal and monetary angles even if data were available on a time series basis, every year has some year specific factors associated with it. Variation is the reality and it is the analysts' job to explain this variation, of course with due regard to exceptional extraneous occurrences (such as the drought of 1987). We believe there was no such exceptional occurrence in the chosen years, we hasten to add that it is our personal judgment. Moreover, purists might argue—and TJ may be in sympathy with them—that we need at least 20 observations, and given five yearly surveys, we need to wait for a hundred years to do any meaningful analysis of poverty "trends" in India. In that sense, we have no hesitation in saying that we do not belong to the category of purists.

The above discussion shows that there was nothing wrong with our methodology and the deflator chosen, causality was never implied (let alone established) by us, the qualitative conclusions of our paper nevertheless hold good, that there were no errors in our estimation, and that TJ's suggestion of haste in our publication is without any basis.

Notes

1. We have greatly benefited from discussions with Martin Ravallion who suggested to us to separate the interaction term from the inequality effect. For an excellent discussion of the decomposition see Datt and Ravallion [1990].
2. The decomposition proposed by TJ makes little intuitive sense. It is beyond the scope of the present note to provide a detailed critique of it.

Seeing in Gestalt

C S Lakshmi

THIS is in response to the comments on my article 'Mother, Mother-Community and Mother-Politics in Tamil Nadu' (*EPW*, October 20-27, 1990). I have read the comments of V Geetha (*EPW*, February 16) and Pandian and others (*EPW*, April 20) with interest and care because the critiques have come from a quarter whose opinions I value personally. My paper has been seen, as suffering from a severe bias against the Dravidian Movement in general and with a most pronounced bias against the Self Respect Movement. My political project has been seen as one intent on deliberately suppressing information and distorting history in the name of women's studies. These are very serious allegations because the purpose of women's studies is to add new perspectives to history, not to distort it.

I have taken up identity-politics whose major determinant in this case is language in my opinion. Despite other determinants of caste, religion and class, language is one determinant that has cut across barriers. The identity is established by returning, recreating and recasting terms, idioms and images associated with the language and the identity is sustained through linguistic conventions and associations. In the process the identity gets fixed in such fundamental ways that it has to work within this fixity and perpetuate this fixity. This results in an undynamic and uncritical way of perceiving culture justified as reverence for culture and the culture descends into unalterable specifics in terms of gender. My project has been to study biology, culture and identity-politics and understand how women have carried their maternal bodies through this politics as historical entities. The attempt was not to see women as victims of a culture and politics but to place them in a context and see things in gestalt. I have attempted this as a Tamil woman whose growing years have been influenced both by the language and the ideas that have built the Tamil identity. If I have placed it under critical scrutiny now, I have done it with the same anger and ruthlessness with which Periyar himself questioned his cultural 'heritage'.

For the 1986 Women's Conference held at Chandigarh I sent a paper entitled 'Changing Times and Women: Participation without Protest'. In it a paragraph reads:

... The only persons who were raising questions about what it is to be a woman at this point were those in the Self Respect Movement led by E V Ramasami Naicker, E Ve Ra, as he was known. He had a defiant way of raising questions that were basically meant to shock people; to shake them out of complacency; to face reality. He felt that notions of motherhood curbed women's freedom.

Women must give up begetting children in order to be truly free, according to him (*Penn En Adimai Anai?* p 86). Many women who were in the Self Respect Movement were convinced that religion that bound women and men who enslave women had to be tackled before any cry for social reform. Many of them gave fiery speeches in conferences organised for women in the movement. In a meeting where women's freedom was the major topic only a hundred women came. There were, however, more than 2,000 men. Pointing this out, one of the most powerful speakers of the Self Respect Movement, Neelavathi, asked the male audience what they had gained by enslaving women. She spoke again over a roar of protest. "What have you gained", she asked, "except enslaving us?". She added sarcastically that many Tamil poems speak about the beauty of women's feet which are like flowers. She told the men to buy them slippers at least. She said that a woman must be allowed to use umbrellas. They were protection against the rain, she said. "If your women hold it nothing will happen to their chastity", she said bitingly (*Kudi Arasu*, May 29, 1932, p 9). Slippers and umbrellas were not considered important for women probably because they were not expected to go out. When even these minor matters were controversial, it was no wonder that the Self Respect Movement urged the entire role of woman at home to be questioned. Not that there were no contradictions within the movement. Some of their important women felt that education must not make the woman lose her feminine qualities or make her give up household chores (Report on Women's Conference, welcome speech of Tamarai Kanni Ammaiyar, *Kudinoor* (Coimbatore) 1938, p 15). But the question of what is essentially female was raised only by the Self Respect Movement at this time. The other women apart from accepting mothering as a woman's main role referred every now and then to mystical powers of Shakti that the woman possessed which was not seeming to do her much good.

Between 1986 and 1990 no dramatic upheavals have occurred to alter my position and turn me into a Dravidian-hater. However, I went back to the contradictions I mentioned in passing in the paper, when I began work on a paper on 'Gender, Language and Identity-Politics'. It seemed to me that the women's question was not one as it is very often referred to but a plurality of issues to which language added several dimensions. It was not just a question of liberation from oppression of a specific nature enshrined in religion, caste and culture which was made verbally explicit for everyone to see but a variety of issues arising from the nature and mode of induction and participation in this politics of libera-

tion planned as part of establishing a specific cultural identity and the manner in which the problems have been named. When despite blatant visibility and naming, there is a fixity in identity along gender lines at a later stage, one has to look beneath the visibility into hidden areas that were already leading to a particular denouement and look at what has gone along with the naming. To me it appeared that language was a major entry for women into identity-politics and with language came terms, images and definitions regarding gender. With the text of Periyar and other ideologues of the movement like Sami Chidambaram, there were several other strands running counter, parallel and intertwined, forceful and dormant at varying periods. Into Periyar's text was written his personal life because of his charismatic personality and because of the endearment 'thandai' to which he responded and because of the manner in which he had politicalised his person.

I have tried to place these several strands of views, comments, activities and notions ranging from the sublime to the bizarre which work along and at the same time counter to the programme of Periyar of questioning essentialisation of gender and at the end, turn it on its head. (By the way, there were two paragraphs giving details of Periyar's thoughts on men liberating women and on *Thirukkural* which were left out by the typist in the final draft not with any sinister motives but because of oversight.) It is in this context—in the context of what seemed to be a radical programme descending into specificities of gender—that I refer to Frigga Haug's comments on division along gender lines and not to dub the members of the Self Respect Movement as Nazis. In no other reading of the paper was this meaning read into the paper. Regarding periodisation of the movement, from the point of view of the women of the movement I saw four phases of major importance. The initial phase of meetings; participation in the anti-Hindi agitation; Nagammai's death and later; Periyar's marriage to Maniyammai and later. The non-separation of the phases of the movement along the usual lines was because I was dividing the movement into phases which I thought was more relevant to the women participants. However, this part of the paper may need alteration now to bear out my position more clearly, leaving no room for doubts.

I am writing this merely to clarify my stand regarding motivation because there seems to be a feeling that I have 'studied down' Dravidian politics. Given the political times we live in where one's caste is mistaken for one's position I felt this clarification was immediately needed. A longer paper I am planning to write and hoping to publish in the *EPW* would, I hope, clear all other doubts.

NOTES AND SCHEDULES TO FINANCIAL STATEMENTS AT MARCH 31, 1991

1 Principal accounting policies

(a) General

The accompanying financial statements have been prepared on the historical cost basis and conform to the statutory provisions and practices prevailing in the country.

(b) Transactions involving Foreign Exchange

- (i) Monetary assets and liabilities have been translated at the exchange rates ruling at the close of the year.
- (ii) Income and expenditure items have been translated at the exchange rates ruling on the date of the transaction.
- (iii) Profit or loss on outstanding forward contracts have been accounted on an accrual basis.

(c) Investments

Investments are valued at the lower of cost or market value.

(d) Advances

- (i) Provisions for doubtful advances have been made to the satisfaction of the auditors.
- in respect of identified advances based on a periodic review of advances and after taking into account the portion of advances guaranteed by the Export Credit and Guarantee Corporation and similar statutory bodies.
- in respect of general advances based on management's estimates of potential exposure and taking into account guidelines issued by the Government of India and the Reserve Bank of India.
- (ii) Advances are shown Net of Bills Rediscounted under the New Bill Market Scheme of the Reserve Bank of India.

(e) Fixed Assets

- (i) Fixed assets have been accounted at their historical cost.
- (ii) Depreciation has been provided on the diminishing balance method at the following rates per annum:

| | |
|----------------------------------|-----|
| Furniture and fixtures | 10% |
| Electrical fittings and fixtures | 33% |
| Equipments | 33% |
| Motor vehicles | 33% |
- (iii) Certain fixed assets which were provided without charge to the Branch by Head Office are included in these accounts at nominal value for the purpose of control.

(f) Staff Benefits

Provision for gratuity is made on the basis of an actuarial valuation. Provision for pension benefits is made on an accrual basis. Separate funds for gratuity and pension have been created.

(g) Taxation

The balance of profit disclosed in the Profit and Loss Account is after provision for taxes on income in accordance with statutory requirements.

2 Remuneration paid to the Chief Executive Officer(s) in India

| March 31 1990 | | March 31 1991 |
|------------------|---|------------------|
| 311 760 | Salary | 461 560 |
| 55 412 | Perquisites evaluated in accordance with Income tax Rules | 81 227 |
| 360 179 | | 542 787 |

3 Schedule of Particulars of Advances required by the Banking Regulation Act 1949

| March 31 1990 | PARTICULARS | March 31 1991 |
|------------------|--|------------------|
| 430 458 107 46 | (i) Debts considered good in respect of which the Banking Company is fully secured | 421 652 241 68 |
| 52 464 118 54 | (ii) Debts considered good for which the Banking Company holds no other security than the debtors' personal security | 6 931 133 61 |
| 230 104 954 70 | (iii) Debts considered good secured by the personal liabilities of one or more parties in addition to the personal security of the debtors | 224 697 551 91 |
| Nil | (iv) Debts considered doubtful or bad not provided for | Nil |
| 613 026 180 50 | Total of advances | 752 280 927 20 |
| 201 027 93 | (v) Debts due by directors or officers of the Banking Company or any of them either severally or jointly with any other persons | 156 750 00 |
| Nil | (vi) Debts due by Companies or firms in which the directors of the Banking Company are interested as directors, partners or managing agents or in the case of private companies as members | Nil |
| 238 850 09 | (vii) Maximum total amount of advances including temporary advances made at any time during the year to directors or managers or officers of the Banking Company or any of them either severally or jointly with any other persons | 201 027 93 |
| Nil | (viii) Maximum total amount of advances including temporary advances granted during the year to the companies or firms in which the directors of the Banking Company are interested as directors, partners or managing agents or in the case of private companies as members | Nil |
| 1 047 601 00 | (ix) Due from Banking Companies | 189 553 639 21 |

4 Previous year's figures have been regrouped wherever necessary.

AUDITORS' REPORT ON THE FINANCIAL STATEMENTS
UNDER SECTION 30 OF THE BANKING REGULATION ACT, 1949

We have examined the balance sheet of the Bombay Branch of Societe Générale (incorporated in France with limited liability) at March 31, 1991 and the related profit and loss account for the year then ended. Our examination was made in accordance with generally accepted auditing standards and, accordingly, included such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances. We have also obtained all the information and explanations which, to the best of our knowledge and belief, were necessary for the purposes of our examination and have found them to be satisfactory.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949 and the provisions of Sub-Sections (1), (2) and (5) of Section 211 and Sub-Section (5) of Section 227 of the Companies Act, 1956 the financial statements are not required to be, and are not drawn up, in accordance with Schedule VI to the Companies Act, 1956. The accounts are, therefore, drawn up in conformity with Forms A and B of the Third Schedule to the Banking Regulation Act, 1949.

In our opinion, the accompanying financial statements give a true and fair view of the state of affairs of the Bombay Branch of Societe Générale at March 31, 1991 and of its profit for the year then ended.

Furthermore, in our opinion,

- (a) the transactions of the Bombay Branch which have come to our notice have been within the powers of the Bombay Branch of the Bank,
- (b) the balance sheet and the profit and loss account are in agreement with the books of account and give the information required by the Companies Act, 1956, in the manner so required for banking companies, and
- (c) the Bombay Branch has maintained proper books of account as required by law insofar as appears from our examination of those books.

National Institute of Rural Development, Hyderabad

announces

DIPLOMA PROGRAMME IN RURAL DEVELOPMENT MANAGEMENT (DRDM)

With the massive expansion of Rural Development activities both in government and non-government sectors, there has been a remarkable increase in the demand for trained personnel to shoulder managerial responsibilities. It is realised that such development administrative cadres should have the ability to analyse and execute the programmes with empathy and concern for the poor and the deprived sections of the community. NIRD has designed a 6 months Diploma Programme (with only three months full time work on-campus and three months off-campus on project work) to meet these specific needs.

Objective

The overall objective of the course is to enhance the capabilities of the participants for more effective formulation of rural development policies and programme management through a comprehensive understanding of the causes of under-development, process of development and programme implementation. The emphasis in the programme would be on management of rural development efforts within and outside government.

Content

The Diploma Programme is divided into six modules, each constituting a paper: (1) Concepts and theories of development, (2) Development issues, (3) Rural Development Programmes, (4) Programme Management Approaches, (5) Programme Management Dynamics, and (6) Project Report.

Eligibility

The course is meant for middle level functionaries from government, banking institutions and non government organisations. A few seats are reserved for students of rural development both from India and other countries. Working knowledge of English is essential.

Diploma

Diploma certificates will be given to those participants who put in the minimum required attendance, pass the examination in different papers and submit the project report within three months of completing the campus programme. Those who complete the campus programme only will be given a certificate.

Duration

Three months: September 3 - November 23, 1991 (on campus)

Project Report to be submitted by 28 February, 1992

Course Fee

The course is offered free for officers of Central, State/Union Territory governments. In respect of nominees of voluntary organisations, full scholarship will be offered on selective basis. However, nominees of commercial banks and other such bodies will have to pay in advance a course fee of Rs 15,000. The course fee for participants from other countries is US \$ 1500. This includes cost of tuition, reading material, accommodation, boarding and field visits.

Monetary Policy for LDCs

The focus of the debate on money's role in economic development has changed in several respects over the last decade in response to new objectives, institutional and political developments, analytical insights and experience across countries at different stages of development. The central issues in monetary policy in the LDCs in the 1990s **1538**

Telecommunications: Alternative Model

The debate on national telecommunications policies needs to shift from the meaningless squabble over the relative merits of privatisation and government owned corporations to customer servicing as the key reference point for organisational design while recognising the needs of operational and regulatory planning and control An alternative structural model **1545**

Election Pointers

Ultimately it is the Congress(I), and not the AGP, which apparently struck a deal with the ULFA in Assam—an inference inescapable in the light of the sweep by Congress(I) candidates in areas where ULFA's writ runs unchallenged **1510**

Despite the dramatic improvement in the electoral fortunes of the Congress(I) after Rajiv Gandhi's assassination the election results show that opposition to the Congress(I) is very much alive in Andhra Pradesh, but is yet to get consolidated through systematic work at the grassroots level by the other parties **1511**

Angry Masters

The paradox of 'democracy' is that every slave master eventually turns his whip on the slave supervisors for allowing things to deteriorate so badly that the slaves are in revolt This is what the World Bank and the donor agencies are now doing with African governments **1554**

Fragile Grandeur

The instances of financial disruption witnessed in the last two decades are clear warnings of the deep systemic risks and fragilities which pose serious threats to the stability of the world's financial centres **1503**

Images of Women

The series of international conferences on Maharashtra Culture and Society has, over the years produced scholarship remarkable for its depth as well as breadth allowing an appreciation of what is uniquely Maharashtrian while treating the region as a microcosm of the Indian subcontinent A report on the fourth conference which was devoted to the theme Images of Women and the Feminine in Maharashtra **1519**

Bhopal's Victims

More than six years have passed since the Bhopal gas leak disaster, three governments have changed, yet very little has been done to bring succour to the victims of this tragedy, to effectively rehabilitate them and to draw the correct lessons from this catastrophe **1513**

Missing the Bus

Unless something drastic is done to arrest the growth in defence, police and other non-development expenditures, India is likely to miss the second technological revolution and world trade boom that seems to be in the offing in the nineties, just as she had failed to take advantage of the enormous technological changes and world trade expansion of the sixties **1528**

Aid and Advice

In the context of the Soviet leadership's pleadings that assistance from the West is critical to Soviet economic survival, the recommendations of the report on the Soviet economy jointly prepared by the IMF the World Bank, OECD, and the European Bank for Reconstruction and Development acquire special significance **1525**

Media's Mission

The news the images and the views on a single page of a single newspaper on a single day exemplify how the media, instead of serving as a critique of the ruling ideology, can be appropriated by that ideology to function as its cultural apparatus **1516**

Time to Change

One must hope that the new government will revise the old negative attitude adopted by the Congress(I) towards Amnesty International in the past Amnesty is not anti Indian **1508**

On Names

IN view of the election of P V Narasimha Rao as Congress(I) president, I would like to bring to your notice the following in relation to the usage of Telugu/Andhra names 'Rao', *ipso facto*, does not denote either the caste or the religion of the person being referred to. For example, P V Narasimha Rao is a Brahmin, J Vengala Rao, a Velama (a warrior clan), N T Rama Rao, a Kamma (a powerful all-round community, also called 'Choudari'), and Ch Devananda Rao is a Christian. Only the Telugu Muslims do not use 'Rao'. So, it will be preferable to describe the person concerned either by his full name or, wherever it is not possible, by his initials—like 'PV' and 'NTR'.

Madras

Biased Interpretations

THERE are a few factual errors in Shatrugna's report (May 18). (1) The Congress candidate contesting from Anakapalle parliamentary constituency was not T Subbarami Reddy but K Ramakrishna (the sitting MP who won in the last election defeating his TDP rival by a majority of nine votes). (2) In explaining the allocation of seats among different caste groups by the Congress(I) and TDP the castes mentioned are Reddys, Kammas, Kshatriyas, Rajus, BCs, SCs and Muslims and the forward castes. Shatrugna states, "for the 34 general seats Reddys 13, Kammas 5, the rest being from the forward castes". Do not Kammas, Reddys, Rajus belong to the forward castes? What castes does Shatrugna have in mind when he talks about 'forward castes'? (3) Rajus, Kshatriyas are not two separate castes but are two names for the same caste.

Shatrugna states that the TDP candidates are non glamorous or are people with humble beginnings. This interpretation of the candidates' backgrounds depends on the colour of one's glasses. The TDP candidates from Visakhapatnam, Amalapuram reserved constituency and Anakapalle, only, to mention a few examples, are people who, from modest beginnings have become very affluent. It is said that in fact the TDP was reluctant to put up the candidate from Amalapuram constituency because he had amassed riches in a short period during his tenure as chairman, zilla parishad. He was selected because he would be able to fight the less-rich but more popular Congress(I)

candidate from the constituency.

It is common knowledge that the tobacco tycoons, liquor barons, civil contractors and film stars do not stake their claims in any one political party. Like bank's investments, they also spread their risks. All important political parties in the country have the support of such people. One has only to look at the antecedents of the TDP general secretary and the TDP ex minister Siva Reddy to counter the conclusion that these tycoons are the monopoly of only one party.

K SUBRAHMANYAM

Communists and Demand for Pakistan

WITH some people, particularly a section of the big press, any stick is good enough to beat the communists with. Here is an example. *The Telegraph*, Calcutta, April 4 in its editorial 'Dangers of Opportunistic Alliances', alleged among other crimes, that the Indian communists "chose the Muslim League as their ally and supported its platform of a separate Pakistan". In a letter to the editor of the newspaper dated April 5, this correspondent, among other things, pointed out:

The communists never sought or established an alliance with the Muslim League or against the Congress. If you kindly look up

the documents of the period, then you will find that they really called for Congress-Muslim League unity as the fulcrum of the Indian national unity. They never supported Pakistan but only the demand for the right of self determination of "the various nationalities such as Pathans, Western Punjabis (dominantly Muslim), Sikhs, Sindhis, Hindustanis, Rajasthanis, Gujaratis, Bengalis, Assamese, Beharis, Oriyas, Andhras, Tamils, Karnatakas, Keralas, etc", so that "free India of tomorrow would be a federation or union of autonomous States".

Moreover, the communists had then made it specifically clear that their proposal "conceded the just essence of the Pakistan demand and has nothing in common with the separatist theory of dividing India into two nations on the basis of religion". The communist document further states that "the recognition of the right of separation in this form need not necessarily lead to actual separation. On the other hand, by dispelling the mutual suspicions, it brings the unity of action today and lays the basis for a greater unity tomorrow."

This letter to *The Telegraph* was sent by registered post. On May 14, a reminder was sent also under registered post. But *The Telegraph* maintained its total unconcern. The letter has not been published. Since the issue is of some importance to the political history of the country, one hopes that the *EPW* will carry this rejoinder.

Shaky Outcome

THE elections to the tenth Lok Sabha have, more or less as expected, yielded a Congress(I) government in New Delhi, but one without a clear majority in the lower house of parliament. What is more, but for Rajiv Gandhi's assassination midway through the elections, the Congress(I) would have ended up with some 60 fewer seats than it has now secured, or some 30 odd seats below even its dismal 1989 tally. This is a matter of some significance, for it confirms that the Congress(I) under Rajiv Gandhi's leadership had failed to arrest its political decline, despite the splintering of the anti-Congress electoral alliance forged for the 1989 elections and the unprepossessing record in office of the short-lived National Front government and its Samajwadi Janata Dal successor. The quick fall of these non-Congress governments and all the attendant political confusion and chaos notwithstanding, the Congress(I)'s principal electoral plank of being the only party capable of bringing back political stability cut little ice with the voters, taking the country as a whole. In other words, there was to be no repetition of the party's triumphant sweep back to power of 1979 after the two-year Janata Party interregnum; even under the continued tutelage of the Nehru family, the days of the Congress(I)'s dominance of the country's politics were very definitely over.

Very many factors and forces have, of course, made for the Congress(I)'s political decline, but the parallel occurrence of this process and the ushering in of the phase of so-called economic liberalisation or the stepped-up pursuit of market-driven capitalist development under Congress governments in the eighties led first by Indira Gandhi and then by her son cannot be dismissed as a coincidence and no more. The marked drying up of employment opportunities in the organised segments of the economy, the sharpened disparities among classes and groups and economic sectors and regions, the heightened clamour and competition from the prosperous and the powerful for politically-mediated give-aways have all found their echoes in the multiplying social and political divisions, tensions and conflicts. In this grab as grab can situation, it is not the decline of the Congress which is cause for concern, but the diminishing prospects of the parliamentary political system yielding viable arrangements for the governance of the country. Anxiety on this score is by no means premature considering that along with the large fresh loans from the IMF, the securing of which is evidently at the top of the economic agenda of the new Congress government which has just taken office in the capital, will come conditionalities calling for even more rigorous enforcement of the economic regime which has been sought to be put in place over the last decade. The consequences of this for the political set-up in the country is something which has received little attention even from the critics of IMF conditionalities.

To get back to the election outcome, along with putting the seal on the Congress(I)'s decline, the other outstanding aspect of it has been the BJP's spectacular performance, doubling its share of the votes polled from 11.4 per cent in 1989 to 22.9 per

cent and increasing its strength in the Lok Sabha from 86 to 119, thereby confirming its position, which it secured for the first time during the term of Chandra Shekhar's rump government, as the principal opposition party in the Lok Sabha. The demand for the building of a Ram temple at Ayodhya after demolishing the mosque there was a major issue in the BJP's election campaign and therefore there is a plebiscitary element in the electoral support that the party has received. This may prove to be volatile to a considerable extent. But to the extent the party's Hindutva appeal has been successful because of the responsive environment created by the general sense of alienation, frustration and disillusionment among the people, to which the BJP is aggressively offering a cure in the form of 'Ramrajya', its electoral base may remain substantially intact till such time as its own inability to put forward and carry out programmes to concretely deal with these conditions begins to be exposed.

The performance of the Janata Dal, which has emerged from the elections as a principal loser in terms of seats forfeited and reduced share of votes polled as compared to 1989, has served to underscore that the backward castes may be a necessary but are not a sufficient popular base on which to construct a serious agenda for social and economic justice. The successful inroads made by other parties into the scheduled caste vote and the tensions and even murderous clashes between the scheduled castes and the backward castes and among the many layers of the latter themselves hold lessons which the party will need to assimilate.

Despite its unseating from power in Kerala, the Lok Sabha elections have once again shown the electoral base of the Left to be limited but relatively stable. However, indications are visible already of a dilemma the Left is going to be confronted with. The contradictory and confusing pronouncements by the CPI(M)'s top leaders, for instance, point to the conflict between the Left's opposition to the Congress(I) and its anxiety to roll back the advance of the BJP. This confusion is likely to plague the Left till it broadens its campaign against communalism to include mobilising the people against all the Congress government's policies which have bred an environment so conducive to the growth of Hindu communal sentiment.

A final aspect of the elections to the tenth Lok Sabha which calls for attention is the fall in the proportion of the electorate which chose to exercise its franchise. What an overall poll percentage of 53-54 per cent taken together with the party's own 37-38 per cent share of this vote means is that the Congress is staking its claim to rule the country on the strength of the support of a bare one-fifth of the electorate. The support garnered by the other parties is, of course, even more minuscule. This should help to put the place and role of parliamentary politics in some sort of realistic perspective. It also underscores how limited the real democratic content of the polity will continue to be in the absence of political decentralisation, with all or most power concentrated in political and administrative organs in the Union and State capitals.

POLITICS

Muted Opposition

THE more closely one looks at the post-election scenario the more disturbing becomes the growing symbiosis between the newly elected ruling party and the opposition. The elusive and ambiguous concept of 'stability' seems to be bringing together the Congress(I) and the National Front Left alliance, opening up opportunities for manipulation by both. Both agree in their rhetoric at least that it would not do any good to have yet another mid-term poll. A minority government therefore would have to be accepted. To make the best of a bad job, the NF Left alliance has decided to adopt a "positive approach" to the new government on the plea that the country faces problems of national importance and of urgent nature.

There is a dangerous diversion in all this talk of 'stability' and problems of 'national importance' which is becoming the hallmark of the half-way house approach adopted by the NF Left alliance. The muted opposition to which the alliance's role will be reduced for all practical purposes may pave way for the BJP to emerge as an unalloyed opposition party looked upon by the people as the only full fledged alternative to the Congress(I).

Let us examine the implications of the 'positive approach' line. The IMF loan issue is going to be one of the immediate concerns on the agenda of the new parliament. Will the NF Left combine vote against a budget that could reflect the conditionalities imposed by the IMF? Since such an action could bring about the fall of the government, they could decide to abstain, again on the plea of maintaining stability. But outside parliament can they afford to remain silent on what in the opposition jargon would be an 'anti-people' budget?

Or, take for example a possible confrontation between the BJP-run States and the Congress(I) in the Centre. Now that the BJP has lost the parliamentary elections from Madhya Pradesh and Himachal the Congress(I) (as has been its wont in the past) could try to dislodge the BJP government in those States to serve its own partisan interests. This would of course politically suit the NF Left alliance at this juncture. But how could its justification for the option of remaining silent on the dispute be comparable with its general policy on Centre-State relation?

On the question of dealing with terrorism in Punjab and Kashmir, the NF Left alliance already in general agreement with the Congress(I). Bringing up of the repressive apparatus from the perspective of the hardships imposed on the people

thereby—seems to be the consensus decision arrived at by all the national political parties. On this issue, the BJP is also an ally. The bogey of 'national disintegration' (blamed on that omnipotent phantom, the 'foreign hand') has always been raised by the Congress(I) to disarm an opposition all too willing to accept without batting an eyelid whatever the officials of the home and the external affairs ministries feed them with.

The much trumpeted need for a 'stable' government at the Centre, ostensibly to prevent 'national destabilisation', seems to have paralysed the NF-Left opposition parties and is likely to stampede the citizens into accepting whatever unpopular measures that the new government might take. The Left in particular is in an unenviable position. Having asserted all these years the need to fight the Congress(I) tooth and nail, the Left has to find a cover that would convince its cadres and the vote bank that there is a higher cause for its decision to adopt a 'positive approach' to the Congress(I) government. The higher cause of 'national stability' may not cut much ice with the people after the budget. The objects of the Left's 'positive approach' also do not inspire much confidence. They are the same people—the 'coterie' and its opportunist allies in the Congress(I)—against whom the Left had been vociferous. It is futile to discover any 'progressive section' within this group. How long can the Left continue to sustain such a government and shelve thereby the inevitability of another mid-term poll?

IMF LOAN

Real Issues

THE matter of having to resort to the IMF is being wrongly posed. Being a full fledged member of the Fund, the option of approaching it for assistance is, of course, always open to us, though even in this regard a distinction has to be drawn between the types of assistance a country seeks. While first tranche borrowing or borrowing under the compensatory financing facility carries relatively low conditionality, borrowings over and above these carry stringent conditionalities. So in the context of the current debate, let us be very clear that having already availed of the low conditionality financing, what we are now to discuss is the question of high conditionality borrowing from the Fund. It is no longer a simple question of borrowing at a certain rate of interest, for a given period of time and on certain repayment terms. The question is a larger one about the conditions which the Fund attaches to its loans with regard to the country's economic policies, specifically with regard to the trade, tariff, fiscal and monetary policies. In this context the

World Bank's recent document on the strategy of trade reform in India backed by appropriate macro-economic measures becomes extremely relevant.

So when the matter of resorting to the Fund is debated, we have to do so in the full awareness of the sort of conditionalities that the assistance from the Fund will entail. The new government at the Centre will have to bind itself to the obligations that the Fund will want to impose as a precondition to the extension of its assistance. This may well be the very first major matter that the new cabinet will be seized of, a matter brooking little delay or prevarication but all the same one that cannot be decided upon in a rush because the obligations the country will be entering into will determine the government's economic policy over the next three to five years.

As has been brought out in these columns, the package of policy measures advocated by the World Bank in its trade reform report has, to say the least, a very questionable basis. The trade and tariff reform the Bank is advocating will throw open the gates to imports which would either be totally unnecessary or be at the expense of the already well-established domestic industry, especially the capital goods industry in regard to which India has attained a reasonable level of self-sufficiency.

As regards the macro-economic policy measures the Bank advocates, the doubts which arise are as serious and weighty. Devaluation as recommended appears to be totally unwarranted in the light of recent experience. Since the mid-80s despite sharp devaluation of the rupee, our exports have increased at a slower pace than our imports. Moreover, the steady depreciation of the exchange rate is already known to be affecting domestic industry adversely.

As regards budgetary and monetary policy, the World Bank's emphasis on reducing the so-called fiscal deficit raises the strong suspicion that the purpose is not so much to control inflation as to constrain the role of the government in the economy.

In the circumstances, while debating the question of resorting to the IMF, we ought to be clear on whether or not the sort of conditionalities being proposed would be acceptable to us.

MAHARASHTRA

Congress(I)'s Quarter

IN the overall post election tapestry Maharashtra presents a slightly different motif. For one thing, it has given the Congress(I) the largest contingent of MPs from a single State. For another, the saffron wave which has inundated several unexpected areas seems to have made less

if an impact. That's the conclusion one can draw from the overall results from the State. The first is an important factor in the internal power equations within the Congress at the Centre, and the second, while it has elicited sighs of relief from progressive political quarters, has brought even more into the open the innumerable problems within the BJP-Shiv Sena alliance.

Undoubtedly, the Congress(I)'s performance, in the context of its showing in other States, is impressive. And given that most observers acknowledge that a large measure of this success is due to the special efforts of Sharad Pawar in the post-assassination phase which led to a catching up of internal differences, even if only temporarily, it isn't surprising that the Pawar camp should be projecting this as a sign that the party has regained favour with the people of Maharashtra. That is the typical kind of wishful thinking practised in politics. For a significant factor in assessing the election results in the State is the fact of the remarkably poor voter turnout of 47.5 per cent. The Congress(I) won its 37 seats with 47 per cent of the votes. What this means essentially is that less than a quarter of the electorate has supported the Congress(I). Further, while the Congress(I) has secured nine seats more than it did in 1989, it has gained only 1.32 per cent additional votes.

As expected, the party has registered impressive results in Vidarbha, Western Maharashtra and Northern Maharashtra. In Vidarbha it has regained three of the four seats it had lost in 1989 to the BJP. It also regained its Amravati seat lost to the CPI the last time. The defeat of Vasant Sathe in Wardha by a CPI(M) candidate was more or less a foregone conclusion given that the party workers had been openly opposed to him there. The Nagpur seat contested by Banwarilal Purohit, who had only lately left the Congress on the Ayodhya issue to join the BJP, was another prestigious seat: it won with a substantial margin. In Western Maharashtra too it was a clear-cut win for the Congress notwithstanding the defeat of V N Gadgil who, it appears, had not contended with the consequences of leading the dissidence against Pawar. In Northern Maharashtra the party won all but one of the eight seats capturing 53 per cent of the votes.

The Congress performance in the other regions hasn't been as remarkable. In Konkan it secured four out of the five seats, including the prestigious Rajapur seat defeating Madhu Dandavate, with 37 per cent of the votes, only 2 per cent more than the tally of the BJP-Sena alliance which managed to retain the Thane seat by a small margin of 28,000 votes. Thane incidentally had perhaps the smallest voter turnout of 37 per cent. In

Maharashtra the Congress polled only 39 per cent of the votes but regained two seats, Jalna and Beed, which it had lost in the 1989 hustings. And in Bombay, it regained two seats, lost one and retained two.

While it is true that the BJP-Sena alliance lost five of the seats it had won in 1989, it has marginally improved its vote by 0.98 per cent. It has gained an impressive 29 per cent of the votes. Taken separately, this gain has come, significantly, from the Shiv Sena performance which has improved its vote by almost 5 percentage points, whereas the BJP has actually lost about 4 percentage points with six of its candidates losing their deposits. However, the alliance candidates were in second place in 25 constituencies.

The Janata Dal's complete rout in the State is undoubtedly a major factor in the stellar performance of the Congress(I), the most telling evidence of which is the shock defeat of Madhu Dandavate. The anti-BJP vote which would have been shared by the JD and the Congress(I) seems to have moved *en bloc* to the latter. Thus the BJP-Sena alliance's failure in translating vote gains into seats is attributable to the poor performance of the Janata Dal, and not because the alliance's electoral theme failed to take off. On the other hand, it is equally true that it is the Sena which has emerged as the more successful of the two, which could well be a symptom of an even more dangerous trend than the espousal of the Hindutva cause.

RISING PRICES

Uncomplaining Victims

A Correspondent writes:

WITH their attention focused on high politics, most people naturally tend to overlook more mundane affairs of daily life. Following the successive bandhs, official, unofficial and non-official, in the wake of Rajiv Gandhi's assassination, prices of daily necessities all over the country shot up to abnormally high levels. For instance, potatoes which had been selling at Rs 2.20 per kg came to cost Rs 6 for a while in some places. There was a more or less corresponding rise in the prices of other vegetables all over. The mournings and associated bandhs are now events long past, prices, however, have not returned to their previous levels in most cases. Potatoes, for instance, may now be got at Rs 4.00 a kg. Some mercy, no doubt.

After Sriperumbudur, the governments, at the Centre and in the States, have become, rightly indeed, much more security conscious and strengthened the security checks at various levels, from No 10 Janpath and Parliament House to T N Seshan, Jayalalitha and Jyoti Basu. But little or no steps have so far been

taken to safeguard the common people's life-sustaining food items. Indeed, while newspapers and politicians vie with one another in bemoaning the fatal attack on the departed leader, they hardly notice the conspiracy to deprive the poorest of the poor of even their very inadequate food.

But why blame the elite only? Even the poor people themselves who thronged the capital's thoroughfares in hundreds of thousands to bid goodbye to Rajiv Gandhi have not noticeably bestirred themselves to draw others' attention to the conspiracy to starve them. In other words, dominated by the elite-imposed diversionary consciousness as they are, the vast masses at the base of our social pyramid are yet to be aware of their own deprivation to a degree which could stir them to collective action, or at least articulation of their keenly felt wants. This is, indeed, the basic problem of the Indian democracy which cannot be solved by any Constitutional magic or lectures on political morality.

NRI REMITTANCES

Not Attractive Enough

THE Foreign Currency (Ordinary-Non-Repatriable) Deposit Scheme announced by the Reserve Bank is meant to attract NRI funds in the form of non-repatriable deposits. While it is supposed to be "aimed at providing further incentives and to give wider options" to Indians resident abroad, individuals as well as corporations, to make investments in the country, the specific purpose is to delink the inflow of such funds from any future obligation to permit their repatriation. Thus the foreign exchange received under this new scheme, once received, will stay with the government. This is unlike the FCNR and the NRER schemes under which funds received from abroad are repatriable. The difference between these two schemes is that whereas under the former there is no exchange risk because the deposits continue to be designated in foreign currency, under the latter exchange risk is not covered as the deposit is denominated in rupees and the rupee deposit, along with the accrued interest, is reconverted for purposes of repatriation at the exchange rate prevailing at the time of such repatriation. It is precisely because of this difference between the two schemes that the inflow into the deposits designated in rupees had lately totally dried up as the exchange risk has been mounting higher and higher.

In fact, it has been pointed out time and again, the NRER scheme was bound to lose whatever little attraction it had in the form of the higher interest rate, given the pace at which the rupee was being devalued month after month since the mid-1980s. What really needed to be done, therefore, was to create a facility for those

OF OUR NRIs WHO HAD GONE OVERSEAS temporarily leaving their kith and kin behind and who would one day return whereby they could remit their foreign earnings home without fear of incurring exchange loss. It has taken our bureaucrats so many years to wake up to the need to create a facility of the above type. Only the worst type of balance of payments crisis has shaken them to this realisation. But are they not bolting the doors after the horse has fled?

The Reserve Bank's new deposit scheme has been sought to be made out to be an improvement on the FCNR scheme in the sense that it offers a higher rate of interest of 1 per cent above the rate on deposits made for three years under the latter scheme. But is that really a great concession? The deposits made under the FCNR scheme are supposed to be for a fixed period of five years. If the higher rate of interest of 1 per cent is for locking up one's funds for a longer period, can one not ask what concession is the scheme offering for the commitment not to repatriate the funds abroad? As far as one can make out, the only other concessions the scheme offers are with respect to income tax, wealth tax and gift tax. But even on FCNR deposits no income tax or wealth tax is attracted, nor is gift tax payable for any gift made out of these deposits.

Could it be the thinking that precisely because the new scheme is addressed to NRIs who would in any case not be interested in the repatriation of their funds abroad they do not need to be given any additional concession? The provision of exchange risk cover should do for this group of NRIs. Why give them additional incentives? Here, it has to be remembered that to most, if not all, of these NRIs income tax concessions would not matter much. After all, most of the savings from their hard earned income would just be enough to build up a few assets of their own like a house or a piece of agricultural land and set themselves up in trade or industry.

Why do the mandarins in the government, including those in the RBI, not remember that whatever the objectives behind the homeward remittances of our NRIs, including the most modest of them who are spread all over West Asia, especially the Gulf, they are not immune to various pressures? Have they forgotten that there is a flourishing 'hawala' trade in foreign exchange?

If the purpose was really to attract the inflow of funds from abroad through our NRIs, the need was to offer a package of incentives that they could not turn their backs on easily. Only a bold person will wager his all on a scheme which offers 1 per cent additional interest for locking up one's funds for a period of five years and that too with repatriation facilities

altogether withdrawn. But our mandarins have to wager nothing on the success of any of their schemes. So who cares?

But maybe the real purpose is precisely to show that such schemes add up to little. And that there is no go but to seek help from IMF.

ARMS CONTROL US Double-Speak

ON the one hand George Bush speaks of the need for arms control in West Asia and pleads for "collective self restraint" by the five permanent members of the UN Security Council, who are also the major arms exporters of the world and who account for practically all of the arms imports into West Asia. On the other hand, his defence secretary, Dick Cheney, goes soon thereafter to West Asia canvassing the sale of various types of arms and shamelessly proclaims that "it is not inconsistent to say on the one hand that we are interested in arms control and on the other hand that we want to make certain our friends can defend themselves".

The US defence secretary has announced agreements with the UAE and Bahrain for the sale to them of Apache missile firing helicopters and with Israel for the supply of F 15 jet fighters in addition to support in the development of a missile defence system. Furthermore Cheney has made public the US intention to stockpile arms in Israel to meet any future contingency.

What does all this add up to? Instead of trying to help the countries of West Asia to turn the region away from war and turmoil into an area of peace, what is really being attempted is to make it a potential cauldron which, when it blows up, will perhaps result in a conflagration the like of which the region has never before witnessed.

And all for what? To dump unwanted and nearly obsolete arms in the region. Let us not forget that these arms have already been paid for by the benefactor nations like Japan and Germany, not to speak of Saudi Arabia and Kuwait, as part of their contribution to the Gulf War. In that transaction itself, the US is believed to have made a net profit of \$ 20 to \$ 30 billion. Now Dick Cheney wants to 'double sell' the arms he has already been paid for.

The purely profiteering angle apart, it is the broader issue which needs to be concentrated upon. Is the world going to be confronted with yet another Gulf War? Surely, that likelihood cannot be dismissed if the world community cannot restrain US weapon mongering. Francois Mitterrand and his other counterparts in Europe have to act fast on this front. Mere admonishing, and that too rather tangential, would hardly do.

TWENTY YEARS AGO

I PW, June 19, 1971

The wide-ranging dismissals of important ministers and officials in the Egyptian cabinet and ruling party last month were regarded in some quarters as signifying more than the consolidation of Sadat's power base. As most of those dismissed, especially Ali Sabry and Samy Sharaf, were considered to be 'Leftists', these dismissals were seen as a calculated move to lessen Soviet influence in Egypt. The Soviet reaction was on the surface extremely unperturbed. But the arrival of Nikolai Podgorny, the Soviet president, in Cairo on May 25 showed that the Russians were far from unconcerned. [The delegation] had an ace up its sleeve in the form of the 'treaty of friendship and co-operation', which was signed within 48 hours.

With their vast military and economic investment in Egypt and the recent upheavals within the Egyptian government, [the Russians] probably feel the need to institutionalise their relationship with Egypt so as to have a greater knowledge of and influence on governmental changes within Egypt. The treaty, which is the first with a non-communist country since the end of World War II, is also a gentle reminder to Egypt and other Third World countries that they cannot easily do without Soviet political, economic and military help.

This does not mean that the Russians now have an open ended commitment to back Egyptian military adventures against the Israelis. It does, however, mean further Russian involvement in the defence of Egypt against an Israeli attack. Nor is the treaty an attempt at getting tough with the Americans. More likely it is an indication to the United States that West Asian stability and peace can only come about if the Americans agree to co-operate with the Russians in coaxing both the Israelis and the Arabs towards agreement.

★ ★ ★

The latest national income data, for 1969-70, show how limited the economic recovery has been despite successive good harvests. It is now becoming evident that those who expected agriculture to trigger off growth (and a market for industrial products) had misunderstood the economic forces which govern growth. Agriculture cannot be the 'triggering' mechanism, it can merely provide a stability condition in which growth may be stimulated in other sectors. The rate of growth outside agriculture had been almost twice that in agriculture, in the past. Given today's growth rate (5-6 per cent) in agriculture, India could easily make a run for a 10-12 per cent growth in areas other than agriculture. We have wasted four years doing nothing.

World Class in Tyre Technology

Kumaran Pola

MRF, the Madras-based tyre industry giant, has closed the latest accounting year on September 30, 1990 and brought out the results for a six-month period. With the accent on diversification, the company is pursuing new projects to take it in newer directions. The chairman and managing director, K M Mammen Mappillai, finds the company on the threshold of becoming a major trading house even by world standards.

MRF brings world class technology to India. Its Vapocure project is a case in point. Advanced Australian technology has enabled MRF to revolutionise industrial painting systems. In collaboration with Vapocure, Australia, MRF offers a wide range of polyurethane paint formulations that can be rapidly cured at room temperature. It is the only technology worldwide in this area and MRF is the sole licensee in India. Licensees in other countries around the world include big names such as Dupont

and Sumitomo. The plant site is located at Cuddalore, Tamil Nadu, and production has already started. The polyurethane formulations will help in the manufacture of shatter/proof glass too.

Bringing toy technology through Funkskool, an MRF subsidiary, is yet another bold venture. The company launched Funkskool in collaboration with Hasbro (USA) sometime back. The Funkskool plant located in Goa is one of Asia's most modern toy projects. Toys are made of high grade, non-toxic material with quality standards at par with the best in the world.

MRF is a recognised trading house and its exports are racing towards the Rs 100-crore mark. MRF has already established trade links with over 55 countries. MRF quality products have won over competition from European and American business houses. Apart from tyres which are its mainstay, the company is India's largest exporter of marine pro-

ducts. MRF also exports leather, large quantities of cashew, spices and tea. During the six months ended September 30, 1990, tyre exports increased by almost 74 per cent. The USA, Afghanistan, Bangladesh and Middle East continue to be the company's main markets. The company's diversification into finished leather is paying off. The participation in the Semaine Internationale Du Cuir in Paris and the International Leather Fair in Madras has established its presence in the world leather market. The foreign exchange earnings on account of the export sales amounted to Rs 31.72 crore and foreign exchange outgo Rs 22.06 crore, excluding imports of natural rubber to the extent of Rs 7.81 crore canalised through the State Trading Corporation of India and paid for in rupees.

In the field of tyres, which accounted for 87 per cent of the sales of MRF, the collaborators, the Uniroyal Goodrich Tyre Co, USA, have been continuously helping it for quality improvement by imparting technological developments. The R and D efforts of the company coupled with updated technology from its collaborator resulted in high quality standards and strong brand preference. Total tyre production at 18.86 lakh far exceeded the 14.70 lakh and 11.91 lakh produced by the closest two competitors during April-September 1990. MRF is now also in collaboration with Michelin, the world's largest tyre makers, which will enable the creation of state-of-the-art aircraft tyres.

As regards the prospects for 1991-92, the directors state that the tyre industry in the world is passing through a severe recession and demand in India has also been affected adversely. Despite this, MRF achieved a production of Rs 173.70 crore during the first three months as against Rs 134.10 crore in the corresponding period of the preceding year. Gross sales worked out at Rs 177.30 crore as against Rs 153.40 crore.

The work of modernisation and expansion is well under way in all the manufacturing units of the company. Production is expected to commence soon in the diversification project to manufacture of conveyor belting. Trial production at the Medak tyre project is expected during the year. In order to establish the company's presence in leather exports, Aruna Leathers and Exports was amalgamated with the company.

The financial results of the company during the six months ended September 30, 1990 showed an annualised growth of 17 per cent in net sales, 62 per cent in operating profits and 54 per cent in net profits. Though the assets utilisation ratio declined from 1.79:1 to 1.70:1, a higher net

Balance Sheet Analysis by Manisha C Mehra

profit margin of 3.68 per cent compared to 2.80 per cent improved the profitability ratios. The overall return on investment spurted to 6.27 per cent from 4.99 per cent and return on equity to 28.43 per cent from 21 per cent.

The balance-sheet changes showed a funds-flow of Rs 57.16 crore during the six months period. The inflows consisted of increases in reserves and surplus Rs 8.30 crore, current liabilities and provisions Rs 21.92 crore (of which Rs 15.64 crore were on account of sundry creditors), short-term loans Rs 6.27 crore and long-term loans Rs 20.67 crore. Of this, Rs 13.06 crore were utilised to increase fixed assets, Rs 11.35 crore to build up inventories and Rs 22.39 crore to accumulate accounts receivables. The balance represented increases in other assets.

The debt/equity rose to 1.90:1 from 1.71:1, though this did not affect the interest coverage ratio adversely which moved up to 2.98 times from 2.28 times. The current ratio improved from 1.71 to 1.76

LIPTON INDIA

Traditional Businesses Do Well

LIPTON INDIA registered a record performance in its traditional businesses during the financial year ended December 1990. Its traditional business are tea, edible fats and dairy and animal feedstuffs. However, in the new foods business, which accounts for less than one per cent of total production, the results were unsatisfactory. Production of various items in 1990 were as follows with comparative figures for 1989 in brackets:

| | (Tonnes) |
|--|------------------------|
| (1) Blended teas including bulk, packets and tea bags (including quantity processed by others) | 40,811 (44,139) |
| (2) Hydrogenated oils/vanaspati/ refined liquid oils (including production at part-leased facilities at Hindustan Lever factories at Sewri, Bombay and Shamnagar, West Bengal) | 59,147 (57,261) |
| (3) Milk powder (including baby food) | 2,942 (3,346) |
| (4) Margarine (includes production at Hindustan Lever) | 1,150 (951) |
| (5) Ghee | 2,201 (2,163) |
| (6) Animal feedstuffs (including quantity processed by others) | 2,39,930 (2,26,977) |
| (7) Food and beverages (processed by others) | 966 (7,168) |

Sales of pouch-pack 'Taaza' tea continued to grow significantly during the year. The company started operations at

its new packet and instant tea factory in Etah district in Uttar Pradesh. In addition, several cost restructuring measures were also adopted.

The profitability of the edible fats business was improved through higher volumes and better management of working capital and costs. A range of speciality fats were successfully launched which contributed to the improved results of this business. Due to the abundant availability of milk and milk powder, margins in the milk powder business were under pressure. However, dairy volumes registered an impressive growth.

The animal feedstuffs business had another good year with significant increase in volumes. The business continued to make a steady and substantial contribution to the company's profitability. However, volumes were adversely affected in the new foods business mainly due to lower than anticipated market growth in the fruit drinks segment. This resulted in losses on account of accumulated slow moving stock which had to be written off as well as higher cost of operations. The company is reviewing its future strategy in this segment.

The company took energy conservation measures with some success in certain areas. Electricity consumption per tonne was brought down in the dairy business from 661 kwh in 1989 to 656 kwh in 1990, although it went up from 29 kwh to 33 kwh in the tea business and from 336 kwh to 350 kwh in the edible fats business. Similarly, furnace oil consumption per tonne declined from 173 kl to 168 kl in the dairy business. Although coal consumption per tonne declined from 220 kgs to 197 kgs in dairy business, it increased from 253 kgs to 267 kgs in the edible fats business. As regards energy from other sources, consumption per tonne declined from 28 kgs in 1989 to 17 kgs in 1990 in edible oil business and spurted from 1,276 kgs to 1,344 kgs in others.

The company continued its efforts in technology absorption and research and development. About Rs 35 lakh, i.e., 0.06 per cent of net sales, were spent by way of recurring expenditure on R and D. Access to Unilever research facilities and the R and D facilities of the company situated at Andheri, Bombay, secured for the company new technology in the field of manufacture of vanaspati by introducing pressure leaf filters in vanaspati factories. R and D has helped use of cheaper raw materials in poultry feed and reduced prices to the advantage of farmers. Similarly, R and D helped in producing cattle feed which gives increased milk yield.

The export earnings of the company exceeded the expenditure on account of imports of raw materials and spares, etc. Foreign exchange earnings amounted to

Rs 11.94 crore in 1990 as against Rs 12.48 crore in the preceding year. As against this, the expenditure on import of capital goods, raw materials and spares totalled Rs 38 lakh each in the two years. In addition, the company spent Rs 49 lakh (Rs 16 lakh in 1989) by way of selling commission, travel, payment of central excise on export and others. Dividend remitted to Unilever, UK, amounting to Rs 1.15 crore in 1990 as against Rs 57 lakh in the preceding year.

The company improved its assets utilisation ratio (sales/assets) from 2.54:1 to an impressive 4.27:1. This resulted from the liquidation of inventories and the lowering of the assets base. In fact, as against a 22 per cent rise in sales, the operating profits showed a decline by 4 per cent and net profits by 44 per cent during 1990. As a consequence, all the profitability ratios plummeted during the year.

STATE BANK OF HYDRABAD

All-Round Growth

STATE BANK OF HYDERABAD crossed the Rs 2,500 crore mark in aggregate deposits in 1990-91 and at the end of March 1991 they stood at Rs 2,500.91 crore. The bank recorded a growth of Rs 409.55 crore in aggregate deposits and the growth rate at 19.58 per cent is far higher than the all scheduled commercial banks' growth rate of 13.7 per cent.

Total advances of the bank at Rs 1,764.27 crore recorded a growth of Rs 248.52 crore. The bank has fulfilled/exceeded all the norms prescribed by the government of India/RBI, as before, except under direct agricultural lending. The priority sector advances of the bank at Rs 664.76 crore constituted 40.80 per cent of net credit against the norm of 40 per cent. Advances under differential rate of interest constituted 1.02 per cent of the net credit outstandings as at the end of previous year against the norm of 1 per cent. Assistance to weaker sections at the end of March 1991 stood at Rs 167.13 crore and constituted 10.26 per cent of net credit against the norm of 10 per cent. The percentage of direct lending to agriculture to net credit stood at 16.19 per cent against the norm of 18 per cent, the shortfall being due to the agricultural and rural debt relief scheme.

The bank's lending to agriculture at the end of March 1991 stood at Rs 294.49 crore despite its extending relief under ARDRS to the tune of Rs 66.42 crore. During the year 1990-91, the bank's assistance to small-scale industries rose by Rs 38.74 crore and stood at Rs 243.49 crore, benefiting more than 51,000 entrepreneurs. The bank's assistance to rural artisans and cottage and village industries stood at Rs 10 crore, covering 28,102 beneficiaries, despite its extending relief

The bank's small business finance increased by Rs 20.33 crore during the year and touched Rs 126.78 crore covering 1,64,692 beneficiaries.

The bank's advances under SEEUY meant for promoting self-employment increased from Rs 41.33 crore covering 21,677 beneficiaries as on March 31, 1990 to Rs 45.67 crore benefiting 23,637 beneficiaries as on March 31, 1991. During the year, the bank extended assistance of Rs 4.11 crore to 1,852 beneficiaries. Under self-employment for urban poor (SEPUP), the bank extended financial assistance of Rs 11.08 crore to 31,397 beneficiaries as on March 31, 1991. During the year, the bank provided financial

assistance of Rs 1.38 crore under the scheme.

The bank's export credit recorded a growth of Rs 28.42 crore representing a growth rate of 43.10 per cent and stood at Rs 94.24 crore as at the end of March 1991. Forex business turnover during the year stood at Rs 826.68 crore. During the year the bank opened nine NRI cells taking the total to 13 and a dealing room at its overseas branch in Bombay. The bank has identified/designated 21 authorised branches for release of forex permits to students going abroad.

The bank has installed 72 advanced ledger posting machines at 33 branches to improve customer service. Two major projects, viz, total branch mechanisation at

acquisition of a mainframe computer for the head office have been taken up during the year 1990-91. Mini computers have been installed at four zonal offices and a fifth is under way.

With the opening of 11 branches in 1990-91—five rural, four metropolitan and one each semi urban and urban—the total branch network reached 691.

The bank has drawn up an ambitious plan for 1991-92 which is its golden jubilee year. The highlights of the plan are a deposit budget of Rs 525 crore, opening of at least 25 branches including specialised branches for NRIs, SSIs, housing, etc., and increase in advances to priority sector by Rs 133.50 crore.

IN THE CAPITAL MARKET

Sarigam Steels

SARIGAM STEELS will be entering the market on July 8 with a public issue of 24 lakh equity shares of Rs 10 each at par aggregating Rs 240 lakh. The company is engaged in the manufacture of stainless steel/alloy steel castings. It proposes to expand its production capacity of alloy steel castings to 15,000 MT per annum by installing a 5 MT furnace and incorporating a 5 MT open forging plant along with facilities for a 1 to 2 tonne closed die forging plant. To streamline its production the company proposes to acquire balancing equipment. For this purpose the company will be acquiring additional land at GIDC Industrial Estate at Sarigam in Valsad district in Gujarat where the existing plant is situated. It is to part finance this project that the company is coming out with the public issue. The company is promoted by Shyam Lal Yadav, a metallurgist and technocrat, who is the managing director. Equity capital will finance the project to the extent of Rs 350 lakh (promoters contributing Rs 110 lakh and the public Rs 240 lakh), term loans will bring in Rs 20 lakh and unsecured loans Rs 30 lakh, all together netting an amount of Rs 400 lakh. The items manufactured by the company have an extensive area of use—in railways, earth moving equipment, steel plants, sugar factories and power generation equipment, agricultural and industrial machinery, bogies and draft gear assembling components. Castings are used in refineries, paper, chemical and petrochemical industries. The promoters have already made arrangements for export purchase of 100 per cent of the company's output in forgings. PNB Capital Services and Subhash Dalal Financial Consultants are the lead managers to the issue.

NEPC-MICON

NEPC MICON is entering the capital market with a public issue of 25 lakh shares of Rs 10 each at par for a project

of Rs 5 crore to manufacture wind turbine generators and wind driven water pumps. Commercial production is expected to start by September. Highlights of the issue include equity participation of world leader MICON, Denmark, for a project in the core sector with low break even at 10.42 per cent. The issue for public investment will open on July 15. A unit of Khemka group, Madras, the company has manufactured and supplied more than 1,000 water pumping wind mills throughout the country. In collaboration with Morup Manufacturing, MICON A/S of Randers of Denmark, it manufactures and installs wind turbine generators. It undertakes windfarm installation on turnkey basis, from preparation of project report to commissioning of wind turbines. Within a period of three years it could in collaboration with MICON, successfully install two 250 KW wind turbines in Gujarat in 1989-90 which recorded its debut in wind power generation. Their activity was further geared up with the subsequent order for 10 MW windfarm project consisting of 50 wind turbines of 200 KW each for Tamil Nadu Electricity Board under DANIDA aid during the same year. The project was completed in a record time and the wind turbines are generating power at a plant load factor of 32 per cent which is one of the highest in the world. Seeing the performance of the wind turbines and enthused by the government incentives of 100 per cent tax depreciation, etc. the company bagged orders of Rs 3.5 crore for 1.5 MW wind farm project of six machines of 250 KW each from three private companies for their captive power generation. The successful completion of this project gave a fillip to the commercialisation of wind energy system and the company is the first in Asia to introduce wind power system in the commercial area. Enthused by the achievement in previous years a new company NEPC MICON has been incorporated in technical and financial collaboration with MICON of Denmark

for implementing the project. In 1991-92 it has bagged orders for a project of 1.5 MW with six machines of 250 KW each for TNEB apart from a host of orders from the private sector. The company is expected to achieve a total turnover of Rs 26 crore in the current year from this innovative concept of national interest.

Lunar Diamonds

LUNAR DIAMONDS proposes to enter the capital market in August. Necessary formalities for filing of prospectus have almost been completed. Incorporated in August 1989 for manufacturing studded jewellery with diamonds and precious gems, the company has its factory at Okhla Industrial Area in New Delhi which is fully operational. The company also has approvals from Noida Export Processing Zone (NEPZ) to set up a 100 per cent export oriented unit (EOU) at Noida for diamond cutting and polishing as well as manufacturing diamond studded jewellery. The establishment of the expansion unit at NEPZ will give the added advantage of liberal imports at cheaper rates and more incentive for value added exports. The total cost of the project is Rs 545 lakh of which Rs 470 lakh will be financed through equity (promoters Rs 168 lakh, public Rs 252 lakh). Sophisticated Israeli faceting machinery has been installed for cutting and polishing of precious gems. The company has already commenced its export business and a letter of credit for \$ 3,00,000 has been established in its favour for the initial export order. Export orders from USA, Canada and Hong Kong to the tune of Rs 5 crore are in hand for which letters of credit are expected shortly. The worldwide market for jewellery is estimated at Rs 36,000 crore and India expects an unprecedented boom in exports of gold jewellery, especially precious stones and diamond studded jewellery. Exports from India are placed at Rs 15,000 crore in 1995. The company hopes to have a good share in this boom.

FORM IIIA

(See Rule 4A (1))

NOTICE

(1) It is hereby notified for the information of the public that Greaves Chitram Limited and Greaves Cotton & Co Ltd propose to make an application to the Central Government in the Department of Company Affairs New Delhi under sub section (2) of Section 23 of the Monopolies and Restrictive Trade Practices Act 1969 for the approval of a Scheme of Amalgamation of Greaves Chitram Limited with Greaves Cotton & Co Ltd. Brief particulars of the scheme are as under:

- (i) Name & address of the applicants
Registered Office
Regd Office
- (ii) Management structure of the undertaking(s) proposed to be merged/amalgamated
- (iii) Capital structure of the undertaking(s) proposed to be merged/amalgamated

Greaves Chitram Ltd
38 Main Road Royapuram Madras 600 013

Greaves Cotton & Co Ltd 1 Dr V B Gandhi Marg Bombay 400 023

Transferor Company is managed by Board of Directors
Transferee Company is managed by the Managing Director under the control and direction of the Board of Directors of the Company

Transferor Company (as per Balance Sheet as at 31 03 1990)
Share Capital
Authorised
25 000 Equity Shares divided into 10 000 Class A Shares of Rs 100/ each
15 000 Class B Shares of Rs 100/ each
Rs 25 00 000

Issued Subscribed & Paid Up
20 492 Equity Shares of Rs 100/ each fully paid up
8 118 Class A Shares of Rs 8 11 800
12 304 Class B Shares of Rs 12 30 400
Rs 20 42 800

Transferee Company (As per Balance Sheet as at 31 3 1990)
Authorised
25 000 15% Cumulative Redeemable Preference Shares of Rs 100/ each Rs 25 00 000
10 50 000 Equity Shares of Rs 100/ each Rs 10 50 00 000
Rs 10 75 00 000

Issued Subscribed & Paid Up
20 265 15% Cumulative Redeemable Preference Shares of Rs 100/ each fully paid Rs 20 26 500
* 9 85 687 Equity Shares of Rs 100/ each fully paid Rs 9 85 68 700
Rs 10 05 95 200

* Since subdivided into shares of Rs 10/ each

- (iv) Present activities of the undertaking(s) proposed to be merged/amalgamated

Transferor Company carries on the business of Civil Structural and Mechanical Engineers
The Transferee Company carries on the business of Manufacturers Merchants Bankers Agents of Joint Stock Companies Commission Agents Manufacturers Agents Brokers Exporters Importers of Engines Boilers and Machinery of all kinds etc

- (v) Brief particulars of the proposed scheme of merger/amalgamation indicating the objective proposed to be achieved
The amalgamation of the transferor company with the transferee company will be effected by a Scheme of Amalgamation under Section 391 read with Section 394 of the Companies Act 1956 (hereinafter referred to as the Scheme)

The main features and effects of the Scheme are as follows

- (a) The whole of the undertaking comprising the assets and liabilities of the Transferor Company will be transferred to and vest in Applicant
- (b) The Transferee Company shall allot such number of Equity Shares of Rs 10/ each as may be necessary to satisfy its obligation for allotment of its Equity Shares to the members of the transferor company in terms of the Scheme
- (c) The transferee company shall cause a Special Resolution to be passed at a general meeting pursuant to Section 81(1A) of the Act for allotment of its Equity Shares to the members of the transferor company in terms of the Scheme
- (d) The amalgamation of the transferor company with the transferee company shall take effect from the commencement of business on 1st April 1990

The main objectives of the Scheme will be as follows

The proposed amalgamation would be in the best interest of both the companies and their respective shareholders and would also be in the best interests and for the welfare of the employees of Transferor Company. The amalgamation of the Transferor Company would enable the amalgamated company to carry the combined business more economically and efficiently. It would bring in economies in operation would ultimately benefit the consumers. The amalgamation would also result in enlarging the activities of the amalgamated company which would avoid duplication and reduction in administrative and other overhead expenses besides optimum utilisation of the managerial and other resources

- (vi) Details of the exchange ratio/consideration proposed for shareholders/creditors of the amalgamated/merged undertaking

Members of Greaves Chitram Limited will get

For every 412 Equity Shares of Rs 100/ each held by them in the Transferor Company one equity share of Rs 10/ each credited as fully paid up in the Transferee Company

(2) Any person interested in the matter may make a representation (in quadruplicate) to the Secretary Department of Company Affairs, Government of India Shastri Bhavan Dr Rajendra Prasad Road New Delhi within 14 days from the date of publication of this notice intimating his views on the proposal and indicating the nature of his interest therein

Financial Leadership at Any Cost?

D N Ghosh

The competition among London, New York and Tokyo for financial leadership is growing intense and each is striving hard to innovate and promote high value-added financial activities. However, the instances of financial disruption witnessed in the last two decades are clear warnings of the deep systemic risks and fragilities which pose serious threats to the stability of the financial centres.

NO single centre today dominates the financial transactions of the world. With the consolidation of the British empire, London emerged, in the late 19th and early 20th centuries, with undisputed pre-eminence and authority. After the Second World War, London had to share financial leadership with New York, and now comes Tokyo with seemingly unassailable economic strength and power. While New York and Tokyo derive their importance from the size and diversity of their domestic economies, London still continues to be an international centre specialising in bringing together borrowers and lenders from all over the world. The three are not equivalent financial centres, but among them, they dominate the world financial scene.

The competition among the three centres is intense and each is striving hard to innovate and promote high value-added financial activities. The driving forces behind this effort are well known: increasing interdependence of national economies, the development of new financial instruments, deregulation of financial services, and technological advances in computers and telecommunications. A growing percentage of financial services activity and employment is, however, no longer captive to any particular location but is extremely mobile.

Governor Mario Cuomo of New York State recognises that the present dominance of New York is no guarantee of its future leadership, and the mobility of financial services is a potential threat to its leadership. How then to keep its pre-eminence? He appointed in 1988 an advisory panel on financial services to study the challenges faced by New York, "as the financial services industry is of central importance to New York and the nation and is a key source of jobs, economic activity and finances". The panel was made up of 30 industry leaders, experts from the fields of banking, securities, insurance, investment banking, law and management con-

sultancy, telecommunications, pension fund management, and related fields. Over 60 recommendations were posed for New York policy-makers for striving to keep the State a national and world leader in financial services. The panel's work provides an illuminating insight into the psyche of the money market practitioners of New York.¹

Clearly, New York has certain essential inbuilt advantages for maintaining financial leadership: concentration of borrowers, investors, financial intermediaries and support business services. Also, it continues to thrive as a principal centre for innovative product development and expertise. However, the threat of dispersion is real: the links of financial markets with specific regional economies are at best tenuous. As dispersion of financial markets and jobs can take place without loss of efficiency, the impact of cost is becoming increasingly critical in the locational decision-making of firms looking for lower cost centres with adequate labour force, telecommunication facilities, technology and infrastructures. The panel finds that New York could position itself as a relatively low cost international location, though it may find it difficult to maintain its relative attractiveness as a financial centre, by continuing to create more and more new business opportunities.

Overall, the recommended strategy for policy-makers consists of four basic elements: location cost and advantages, labour force and human resources, telecommunications and technology, and regulation and taxation. Quite clearly, the first three elements in the proposed strategy can provide the most sophisticated and responsive environment for financial markets to capture the largest share of employment and economic gain. What seems disturbing is the attitude of the panel towards regulation. The focus is on increasing the market share and, in that process, in order to maintain the

dominance of New York, regulation has unfortunately taken a secondary place. "Given the new competitive pressures on firms, burdensome State and local regulations and taxes can be obstacles to the industry's growth in an area. As part of an overall strategy in regulation, governments should review their current financial services regulations in order to ensure that the regulatory environment does not hinder the expansion of financial service. A comprehensive review of all regulations affecting financial service firms should be undertaken, with the specific charge of identifying archaic and unnecessary regulations that can be revised or regulated." The implied policy recommendation is clear: allow free play to technology and cost to overcome the competitive pressures and business will come from other markets and centres.

The fascination with innovation is overpowering. The virtues of competition and technology-driven innovation have undeniably cast their spell, not unexpected from a panel comprising important market practitioners. However, the financial history of the last two decades is not one of unblemished financial innovation, but of financial disruptions as well. There were breakdowns in the supervisory process despite all the illusion of liquidity created by the magic of financial innovation. These disruptions are clear symptoms of deep systemic risks and fragilities and did pose serious threats to the stability of the financial centres.

The report breathes complacency. Issues that are going to dominate the international financial arena in the coming decade will necessarily have a focus on prudential regulation, rather than on innovation, on measures to strengthen and safeguard the system rather than on competitive behaviour to skirt round regulations and on building effective fences for protection of customers and investors from the lure of short-term speculative ventures. The global climate is slowly changing. Blind adherence to competition and innovation are being sought to be tempered by the need for regulation. In the major financial centres there are hopefully encouraging signs of serious discussion on the efficacy of the present regulatory structure.

In the decades to come, the agenda for the financial centres should be that of stability, for stability would have to be the basic plank. A financial centre has to look for more business, but not at the cost of risks and fragility. It must search for durable long-term stability in the interests of investors. This demands co-operation

goals, but for "self-interested mutual adjustment of behaviour". This may not be exciting, but in financial transactions, it pays to be bland rather than impetuous. If the eclectic position sounds too unsatisfying, read the following:

Suppose one is being lectured by a *dirigiste* official of an European ministry of finance, asserting that Eurocurrencies are legions without commanders roaming the financial markets of the world. One's mind should promptly flood with thoughts of the mischief caused by anachronistic government regulations, the beneficial discipline of inter-bank and intercountry competition, the wide range of substitutes for existing financial instruments, the merits of lending decisions decentralised to where information about credit risk is most reliable, and the potential for improved resource allocation and faster growth resulting from savings being channelled to investment projects yielding the highest returns. Conversely, suppose one should be cornered by a vice-president of Citicorp or the Hongkong and Shanghai Banking Corporation, arguing that across-the-board financial deregulation will work supply-side miracles in the world economy. The mind should then overflow with thoughts of bank executives who behave like sheep in choosing a Latin American loan portfolio, drug smuggling proceeds laundered through banks in offshore financial centres, exchange rates fluctuating in response to false rumours started by market participants in order to make explosive trades, and competition in laxity between governments trying to attract financial institutions to their jurisdictions by reducing taxation and the stringency of supervision—not to mention the failures of the Herstatt and Franklin National Banks in 1974, the Credit Anstalt in Vienna in 1931, and the South Sea Company in London in 1720.²

Aggressiveness is the name of the game today, is regulation then for the weak-hearted? Will anyone listen to what Bagehot had to say nearly 120 years ago in *Lombard Street*: "An immense system of credit now exists. The whole rests on an instinctive confidence generated by use and years. If some calamity swept it away, generations must elapse before at all the same trust would be placed in any other equivalent. Nobody would understand or confide in it. *Credit is a power which may grow, but cannot be constructed.*"

SOCIAL ACTION AND THE LABOURING POOR

An Experience

PRIMI A LEWIS

The author of *Reason Wounded: An Experience of India's Emergency* (1978) judged the best book on the Emergency by The Times of India has 12 years later written this candid account of her return to work with the migrant and village labouring poor of rural Delhi from 1978 to 1989. Tracing the change from a politics and strategy of organising for agitation to organising for development, Lewis documents the uphill struggle of the landless villagers, farm and stone quarry workers of Mehrauli to gain control over the conditions of their existence. Through a process of discarding doctrinaire Marxist positions under the compulsions of direct grassroots experience, Lewis and the group she worked with arrive at a fresh and unorthodox understanding of the dynamics of social change in India.

India and Amnesty

A G Noorani

Amnesty International is not anti-Indian. On facts, like any mortal, Amnesty's observers can go wrong. The answer is a corrective response, not condemnation; a dialogue, not a stand-off.

ONE must hope that the new government of India will revise the old negative attitude that had been adopted by the Congress(I) towards Amnesty International. Sadly, the National Front government also backtracked after deciding to let Amnesty's representative in Amnesty is not anti-Indian. Consider its criticisms of Britain and the US.

On June 7, Amnesty published a 64-page report entitled *United Kingdom Human Rights Concerns*. Richard Reoch, old India hand in Amnesty who has been interested in the country for well nigh two decades, is now its head of publications. Releasing the report on UK to the press, he said "It is the persistent failure of the government to adequately address the issue of the protection of human rights which has motivated us to put together this report."

The report is wide ranging, covering well-documented cases of injustice such as the Birmingham Six and the Guildford Four and the investigation into the West Midlands Serious Crime Squad and allegations of confessions being obtained under duress in Northern Ireland. According to the report, "the issues of concern are of such gravity as to seriously undermine confidence in human rights safeguards in the United Kingdom."

The report condemns the arrest and imprisonment of 90 Arabs, mostly Iraqis and Palestinians, during the Gulf war and the deportation of some of them. It says, "All the arrests were carried out under the 1971 Immigration Act on the ground that the detainees posed a threat to national security. The government is not obliged under United Kingdom law to detail its reasons for treating them as a threat." The only appeal allowed was to a non-statutory advisory panel of three people appointed by the home office. The hearings usually lasted less than an hour and the detainees were still not told why they were being held. Amnesty says

Such procedures contravene international treaties, which are binding on the United Kingdom as a state party, and other international standards. These require that all persons under any form of detention be told the specific reasons for their detention before a court with legal representation.

Among those arrested were people who had not used or advocated violence but were detained because of their non-violent political views or activities and/or their

nationality and not because of being genuine security risks.

Amnesty also criticises restrictions on those seeking political asylum in Britain, including the lack of official information given to asylum-seekers, inadequate guarantees on access to independent advice and legal representation and the absence of a right of appeal that can be exercised prior to expulsion from Britain.

On February 21 Amnesty had asked the governments of the US, Britain, Turkey, Egypt and Israel not to violate human rights under the guise of security. It launched an international drive 'Human Rights in the Shadow of War' whose object was "to ensure that human rights issues are not sacrificed to political and military concerns." Iraq was also censured for its brutalities.

On April 12, Amnesty condemned the kidnapping of two Swedish engineers, Jan-Ole Loman and Johann Jansson, by the Kashmiri militants on March 30.

We oppose the torture and killing of prisoners held by anyone—whether these acts are threatened or carried out either by governments or armed groups.

We condemn the torture and killing of prisoners regardless of any reasons that may be given to justify them. To make such threats in connection with human rights is just unacceptable.

What is causing concern to Amnesty, while observing the situation in India, is no different from what agitates thinking Indians themselves: the terms and the actual operation of those hideous laws—the Terrorist and Disruptive Activities (Prevention) Act, 1987, the National Security Act, 1980 and the Armed Forces Special Powers Act, as applied to Manipur, Jammu and Kashmir—and the encounters.

On October 10, 1990, Amnesty published a report on Manipur entitled *'Operation Bluebird' A Case Study of Torture and Extrajudicial Executions in Manipur*. It runs into 73 pages and is duly documented. As is well known, while the State government condemned the Assam Rifles for staging fake encounters preceded by torture, the governor, General K V Krishna Rao, differed, predictably. This man lowered the prestige of the office of governor. The report contains an able analysis of the provisions of the Armed Forces (Assam and Manipur) Special Powers Act, 1958.

On May 10, 1991 Amnesty published a

62-page report titled *India. Human Rights Violations in Punjab—Use and Abuse of the Law*. This report contains a careful analysis of the TADA of 1987. The report does not censure the security forces alone. Contrary to the common impression, Amnesty condemns no less the unlawful imprisonment, kidnapping and torture by militant groups as well. Nearly four pages of the report narrate in detail what the heading of the section sums up, 'Violence by Armed Sikh Groups'.

After narrating the facts the report sums up 'Amnesty International's Position' on such violence. It deserves to be quoted.

Amnesty International condemns the torture or killing of prisoners by anyone, including the various armed groups resorting to such practices in Punjab. Murders of people for expressing their views can never be justified, whether the perpetrators be governments or those opposing them. Governments have a specific obligation to uphold and protect human rights: arbitrary detention, torture and extrajudicial killings of opponents are specifically prohibited by international law. In the case of armed non-governmental groups also there can never be a moral or legal justification for arbitrary or indiscriminate killing of people. Such acts are particularly reprehensible when committed against individuals solely for the peaceful expression of their conscientiously held views or for doing so in a certain language or simply because they may be related to such persons.

Yet, however provocative, the abuses committed by armed groups can never justify the security forces themselves resorting to arbitrary detentions, torture or extrajudicial executions of suspected opponents—the violations of human rights which are the subject of this report. Such practices are not only specifically prohibited in Indian law and in the Constitution itself but they also contravene basic principles of international law. International human rights standards have been made by and are addressed specifically to governments. Countries which have become a party to the International Covenant on Civil and Political Rights (ICCPR) are legally bound to respect and ensure the rights protected in it. Although the ICCPR permits derogations from certain rights in strictly defined circumstances, it stipulates that even in times of emergency threatening the life of the nation all governments must, as a minimum and in all circumstances, protect the right to life and the freedom from torture. India accepted a legal obligation to observe these standards when it signed and ratified the ICCPR in 1979, thereby clearly stating to the international community that it considered itself bound to uphold and protect these fundamental human rights. This report describes how the government has persistently failed to do that.

No one is infallible. On facts, like any mortal, Amnesty's observers can go wrong. The answer is a corrective response, not condemnation, a dialogue, not a stand-off. For Amnesty has amply proved that while on some facts it can be in the wrong, it is incapable of ever being with the wrong. The world would be poorer without Amnesty International.

Auditors' Report on the Indian Branch of Banque Indosuez under Section 30 of the Banking Regulation Act, 1949.

We have audited the attached Balance Sheet of the Indian Branch of Banque Indosuez as at March 31 1991 and the relative Profit and Loss Account of the Indian Branch of the Bank for the year ended on that date signed by us under reference to this report

In accordance with the provisions of Section 29 of the Banking Regulation Act 1949 read with the provisions of Sub-Sections (1) (2) and (5) of Section 211 and Sub-Section (5) of Section 227 of the Companies Act 1956 the Balance Sheet and the Profit and Loss Account together with the notes thereon are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act 1956 The accounts are therefore drawn up in conformity with Forms A and B of the Third Schedule to the Banking Regulation Act 1949

1) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory

(2) The transactions which have come to our notice have been in our opinion within the powers of the Indian Branch of the Bank

(3) In our opinion proper books of account as required by law have been kept by the Indian Branch of the Bank so far as appears from our examination of these books

(4) The above mentioned Balance Sheet and Profit and Loss Account of the Indian Branch of the Bank dealt with by this report are in agreement with the books of account

(5) In our opinion and to the best of our information and according to the explanations given to us the Balance Sheet and Profit and Loss Account together with the notes thereon give the information required by the Companies Act 1956 as amended in the manner so required for Banking Companies and on such basis the said Balance Sheet gives a true and fair view of the state of affairs of the Indian Branch of the Bank as at March 31 1991 and the Profit and Loss Account gives a true and fair view of the profit of the Indian Branch of the Bank for the year ended March 31 1991

ASSAM

Congress Returns to Brahmaputra Valley

Kamarupee

Rejected five years ago as a party hostile to the Assamese-speaking people of the Brahmaputra valley, the Congress(I) has scored notable triumphs this time in precisely these areas where also the ULFA writ runs unchallenged. The inference that the party has struck a deal with the ULFA is inescapable.

FEW tears are likely to be shed over the defeat of the Asom Gana Parishad (AGP) which, after holding office for five years in the State, has suffered a humiliating defeat in the recent elections to the assembly and the Lok Sabha. The party, which had made a spectacular debut in the December 1985 general elections in the State, capturing political office within a few weeks of taking birth, has now suffered an even more spectacular defeat. The Congress(I), which five years ago had been able to win only 25 seats in the 126-member assembly has come back with a bang capturing 65 seats. It has also won eight Lok Sabha seats while the AGP has won only one. The BJP has won two seats (Karimganj-SC and Silchar, both in the Barak valley) and the CPI(M) has won the Barpeta seat. The remaining two seats both reserved for Scheduled Tribes have been won by the Autonomous State Demand Committee (Autonomous District ST) and the 'independent' candidate supported by the All Bodo Students' Union and the Bodo Peoples' Action Committee (Kokrajhar ST).

It is however too early to say whether this defeat of the AGP, the first regional formation in the State to capture political office, marks the demise or even the weakening of regionalism as a political force in the State. For, the factors that contributed to the emergence of the AGP, which in the event turned out to be the 'acceptable face of regionalism', in Assam have deep roots in the social, economic and political history of the 'people of Assam'—indeed in the inescapable necessity to use the inverted commas to denote that ascription, something that is not necessary when one discusses corresponding dilemmas of other nationalities of India. Thus, the expectations, anxieties and rages that have contributed to the emergence of the AGP will not disappear merely because the AGP has suffered a humiliating electoral reverse.

The disaster that has overtaken the AGP has been entirely predictable and was being anticipated in numerous reports from the State. The sheer incompetence of the government leaders, the brazen cronyism, the total indifference to the very issues (some of them non-issues) which the AGP leaders in their earlier manifestation as leaders of the All

Assam Students' Union (AASU) had exploited to launch themselves on a political career only to kick off the ladder they had used to climb—these have clearly not been forgiven.

Indeed, the emergence of the United Liberation Front of Asom (ULFA) which turned out to be the nemesis of the AGP government was causally related to some of these failures that arose out of the hubris of AGP leaders. The AGP leaders' ambivalence regarding ULFA which they could neither suppress nor make a deal with left them with no escape route when finally the crackdown from above came. Ultimately it is the Congress(I) that appears to have struck a deal with ULFA—an inference inescapable in the light of the sweep of the Congress(I) candidates in areas where ULFA's writ used to run unchallenged.

Above all were the unseemly wrangles among the top leaders of the AGP and the rampant factionalism that culminated in the split in the party. Quite in character, this split which had an allegedly 'ideological' basis came about not when the AGP was in office, but after the dismissal of the government—a development which indeed aggravated the internal crisis in the party and made the split inevitable. Hopelessly debilitated by these various self-inflicted wounds, neither the AGP, nor, much less, its various even more feeble clones each posturing more and more extreme forms of an exclusivist regionalism, could carry conviction among the electorate.

Several features of the return of the Congress(I) to the political centre stage in Assam deserve to be noted. Reviled for long and rejected as being allegedly totally hostile to the genuine aspirations (and even more importantly, the apprehensions) of the majority of the Assamese speaking people of the Brahmaputra valley, an area of crucial political and cultural pre-eminence in the State, the party has affirmed its relevance precisely in the very same areas of the State from where it had been so ingloriously ousted by the AGP a little over five years ago. In the demonology of the AGP and its supporters, the Congress(I) (and especially Hiteswar Saikia) had sold itself out to the 'vote banks of illegal foreigners'. The argument acquired some substance in the light

of the pattern of vote and boycott of polls in the controversial general elections of February 1983 when, defying the call for poll boycott by the AASU, the voters in the periphery of the Brahmaputra valley and outside the valley had voted the Congress(I) to office, while in dozens of constituencies in the areas which the Assam agitation leaders were to claim as their own in the December 1985 elections, hardly a few hundred voters cast their votes.

However, the results of the present elections indicate that the grudges and bitterness generated in those bloodstained elections of February 1985 have largely been set aside, though not perhaps forgotten. For it is precisely in the very same areas where AASU's boycott call of February 1983 had a near total response and where two-and-a-half years later the very same AASU leaders in their manifestation as AGP leaders made their spectacular debut that the Congress(I) has scored its most notable triumphs. This affirmation of the Congress(I) as a party no less responsive indeed according to Hiteswar Saikia's pronouncements in the election campaign, far more responsive—to the aspirations (and anxieties) of the people of the State, including the Assamese people, than self-proclaimedly regional political formations like the AGP is perhaps the most significant feature of the election results. Of the 65 seats the Congress(I) has won (which is likely to go up to 66), only three seats are in the 'Bengali dominated Barak valley districts', and a further dozen or so had been held by the United Minorities Front (UMI) and were presumably from the so-called 'immigrant inhabited areas'. But the overwhelming bulk of the Congress(I) victories have been in the heartland of the Brahmaputra valley.

All these still do not add up to an obituary for regionalism in Assam, much less in the north-east region. For accompanying the set back to the AGP and indeed substantially contributing to that set back are the notable triumphs of the movements based exclusively among certain tribal groups in the State seeking greater autonomy within or total separation from Assam. The Autonomous State Demand Committee (ASDC) which has been agitating for the constitution of the two autonomous hill districts of Karbi Anglong and North Cachar Hills into an autonomous State within Assam has swept the Karbi Anglong district winning all the four assembly seats from that district, its nominee has been returned to the Lok Sabha. Nine 'independent' candidates supported by the All Bodo Students' Union and the Bodo Peoples' Action Committee have been returned to the assembly while another such 'independent' has won the Kokrajhar-ST Lok Sabha seat.

Given the widely held belief at least among the AGP supporters, that much of these agitations had received covert backing

of the Congress(I) merely to create more problems for the AQP government, it would be interesting to see how the government will tackle these problems, especially in the light of the repeated affirmations of Hiteswar Saikia that his first priority will be to tackle

these problems (including the issues raised by ULFA), and his known desire to go down in history as a leader more passionately 'Assamese' than the most perfervid proponents of an exclusivist and extreme Assamese nationalism

ANDHRA PRADESH

Two Elections, Not One

M Shatrugna

Rajiv Gandhi's assassination and the postponement of the second phase of the elections by three weeks, during which period the Congress(I) made an elaborate show of exhibiting the slain leader's ashes in the constituencies where elections were put off, changed the electoral fortunes of the Congress(I) quite dramatically

WHILE the rest of the southern States have gone in favour of the Congress(I) in the tenth Lok Sabha elections, the performance of the party in Andhra Pradesh has not been as impressive. It was defeated in as many as 17 important constituencies with wide margins of votes.

Elections were held in Andhra Pradesh in two phases, on May 20 and June 15, with 17 constituencies going to the polls in the first phase and 24 in the second phase after Rajiv Gandhi's assassination. The results of the first phase clearly showed that opposition to the Congress was strong with the party being defeated in 14 of the 17 constituencies, conceding 10 seats to the TDP and one seat each to the CPI, CPI(M), BJP, and MIM. Out of the 108 lakh valid votes polled in these 17 constituencies, the TDP and its allies polled 45.61 lakh (41.9 per cent) and the Congress(I) tally was 43.08 lakh (39.6 per cent). In the ninth Lok Sabha poll in 1989, the TDP and its allies had polled 43.2 per cent votes and the Congress(I) 50.8 per cent in these constituencies. In 1989, all the coastal Andhra seats had been bagged by the Congress(I) barring Narsapur and Bobbili. Apart from the overall poor showing at the polls in the first phase, the party suffered heavy political losses in the area. It lost prestigious seats in the agriculturally prosperous Godavari belt in coastal Andhra. The emergence of the Godavari basin as an industrial area with the discovery of oil and natural gas there has eroded the Congress's political and economic influence. Also, the support of the prosperous Kapu community to the TDP has further added to the discomfiture of the Congress(I). In the Krishna basin also, the Congress(I) reverses have been heavy. For the first time since 1983, Chintur, the most prestigious seat of the area, slipped out of Congress(I) hands.

The defeat of the 92 year old N G Ranga, the doyen of the early Kisan movement in Andhra and a contemporary of the late Chaudhury Charan Singh, by a relatively unknown Muslim youth, Lal Jan Pasha, of the civil contractor tycoon, K S Rao, by K P Reddiah, a backward class leader in Machilipatnam, of Chennupati Vidya by

Vadde Sobhanadeswar Rao in the highly political Vijayawada constituency, of Singam Basavapunniah by Reddy Venkateswarlu in Tenali seat will all have serious consequences for the stability of the present Congress(I) ministry in the State. The Congress(I), which masterminded the Kamma Kapu riots in December 1988, appears to have paid a heavy price for its misdeeds now. Also, the popular theory that the TDP is a Kamma party has been called into question by the fact that it was the Congress(I) which fielded three Kamma stalwarts against Telugu Desam in the Krishna Guntur belt and all three of them lost. The defeat of Chennupati Vidya particularly is a blow to the party as it had specially chosen her—a Brahmin by birth and married to a Kamma—for the Kamma Brahmin dominated Vijayawada seat.

While the reiteration of the Narasaraopet seat by Kasu Venkatakrishna Reddy can be attributed to the enormous influence of the Kasu family in that area, the success of liquor baron Magunta Subbarami Reddy can be traced to the enormous funds Reddy could muster for the election. Chief minister Janardhan Reddy had a personal stake in the Nellore (SC) seat where his hand-picked candidate, Kudumula Padmasri, won the seat with a majority of 45,000 votes. Of the four seats in Ikongana that went to the polls in the first phase, Nalgonda, a traditional stronghold of the communists, was won by Dharma Bhiksham of the CPI with a majority of 68,000 votes. In the CPI(M) bastion of Miralguda, veteran communist Bheem Reddy Narasimha Reddy managed to wrest the seat from the Congress(I) with a slender margin of 8,000 votes. His other rival, the young radical medical doctor Sudhakar supported by the ML parties, garnered about 27,000 votes, mostly at the expense of the CPI(M). For the Secunderabad Lok Sabha seat, a young backward class leader, Bandaru Dattatreya of BJP, who had been detained during the Emergency, trounced T Manemamma Anjaiah of Congress(I) by a massive margin of 85,000 votes. Manemamma, widow of former chief minister T Anjaiah (Reddy) was set up to cash in on the 'sympathy vote' for her late husband,

who had a humble background, beginning as a daily-wage worker in the local Allwyn factory five decades ago. The Congress(I) had picked her in 1984, though she was new to politics. With the loss of Secunderabad, the entire Hyderabad urban area has slipped out of Congress(I) hands. For the Hyderabad seat, the Congress(I) could put up only a token fight by fielding an unknown local functionary as the chances of winning the seat from MIM supremo Sultan Salauddin Owaisi were very remote. The Congress(I) nominee polled only 33,000 votes, losing his security deposit.

In the first phase of the elections, it would appear, the minorities went over to the TDP in the coastal region. A closer look at the voting pattern indicates the emergence of the BJP as a third force. The BJP cut into the vote of the TDP in Nellore (SC) where it polled about 95,000 votes and the Congress(I) won the seat by a 45,000 vote majority. In Ongole also the BJP, with a tally of 28,000 votes, might have altered the result in favour of NTR had there been an alliance with TDP.

The results reflect the dissatisfaction of the people with the 16 month rule of the Congress(I). Apart from not providing any imaginative and creative political programme to the people, the party has sought to scuttle every measure of the TDP government when it was in power, like the subsidised rice scheme, the setting up of mandal level administration at the taluka and the abolition of the age-old village officers system. Congress(I) rule has been replete with internal dissensions, factionalism and worse, affecting the entire administrative set-up even though it is endowed with the services of efficient and honest officers like K Madhava Rao and Mohan Kanda. The internecine battle between the irrepressible N Srinivasulu Reddy and M Chenna Reddy and the final sack of the latter following the December 1990 communal riots have demoralised the civil service. Srinivasulu Reddy is known to refer to Chenna Reddy as 'tax' chief minister, apparently referring to the tax messages sent by the chief minister from the US when he was undergoing treatment for a kidney ailment.

The failure of the government in tracking down the perpetrators of the December 1990 communal violence in the twin cities has also shaken the voters' confidence in the party. The rejection of the Congress(I) in Secunderabad corroborates this. It appears that the voters regarded any political party ranging from BJP/MIM to CPI(M), as preferable to the Congress(I).

However, Rajiv Gandhi's killing and postponement of the second phase of the election by three weeks during which period the State Congress(I) had taken special measures to transport urns containing Rajiv Gandhi's ashes to the constituencies where elections had been postponed, appear to have swayed voters in favour of the Congress(I). Through a splendid combination of political chicanery and unashamed misuse of the state machinery, the

exhibited all over the State. In the second phase of elections, held on June 15, the Congress(I) tally of votes went up to 67 34 lakh (48 per cent), whereas the TDP and its allies secured only 48 34 lakh (34 per cent). Of the 24 seats that went to the polls in the second phase, the Congress(I) bagged 21, sweeping the whole of Rayalaseema and winning major chunks in Telengana. The TDP could wrest from the Congress(I) the relatively prosperous Nizamabad seat and the economically most backward Adilabad seat. The victory of the Congress(I) in Warangal, Hanamkonda, Kareemnagar, Medak, Peddapalli(SC), and Siddipet(SC) has been impressive with huge margins of votes. The BJP factor played a major role in Nagarkurnool(SC) where the party polled about 77,000 votes and the Congress(I) retained the seat with a 51,000 vote majority. Similar was the case in Mahaboobnagar where the BJP polled 1 25 lakh votes and the Congress(I) retained the seat with a 33,000 vote margin over the TDP. Interestingly, in the Peddapalli(SC) constituency where the Congress(I) had polled 2 51 lakh votes the voter turnout was less than 50 per cent. Out of the 10 97 lakh electorate, only 5 21 lakh votes were polled. Though the TDP polled about 1 41 lakh votes there, the poor turnout, most probably due to the poll boycott call given by the Peoples' War Group, appeared to have upset its chances. This is a sprawling constituency covering the entire Singareni Coal belt where the PWG has considered following and dedicated cadres. A low voter turnout generally helps the Congress(I).

The 'sympathy factor' appears to have helped the Congress(I) more as one moves closer to the epicentre of the assassination. Barring Cuddapah, where polling was countermanded due to the death of an Independent candidate, all the seven seats in Rayalaseema have been retained by the Congress(I) with huge margins.

An important feature of the present polls is the emergence of the BJP as a third force. Winning one seat, it polled about 20 lakh (8 per cent) valid votes. This is a sizeable improvement over its tally of 2 2 per cent in 1984 and 2 per cent in 1989. The entry of all the CPI(M) parties, barring the PWG, is also a new development in the State's electoral politics. For the Karimnagar seat N V Krishnaiah, the sitting MLA from Sirsilla was fielded by the CPI(M), Chandra Pulla Reddy group. He polled over one lakh votes, emerging runner up to the successful Congress(I) candidate, J Chokka Rao. Similarly, Gaddam Venkatramaiah of the CPI(M), Pyla Vasudeva Rao group polled about 46,000 votes in Khammam where the CPI(M) candidate was defeated by a narrow margin of 5,918 votes by the Congress(I) candidate, a retired IPS officer who had been the State home secretary.

The election results show that opposition to the Congress is very much alive in the State but is yet to get consolidated through systematic work at the grassroots level by the other parties.

INSTITUTE OF RURAL MANAGEMENT ANAND

Institute of Rural Management, Anand is looking for a suitable person for RBI Chair in Rural Economics

The Institute of Rural Management, Anand (IRMA) was set up in 1979 to provide management education, training and research support to rural organisations especially in the co-operative sector. The Institute operates a two-year post-graduate programme in rural management offered every year to a class of 80-90 students. In addition, the Institute offers a one year diploma programme in rural development management exclusively for young officers sponsored by rural co-operatives, a 3-month General Management Programme is offered as a mid-career reorientation programme to a group of 35-40 senior management personnel from rural co-operatives. The faculty of the Institute also conduct 15-20 shorter duration specialised training programmes/workshops in functional areas such as rural marketing, field organisation, financial planning in management, etc. The faculty are also involved in managerial and policy research relevant to rural organisations and programmes.

The Institute is now looking for a senior academic for the Reserve Bank of India Chair in Rural Economics. The incumbent would have a five year appointment and will be placed suitably in the Professors grade (Rs. 5100-7300). The RBI Chair also offers resources for research assistance and limited travel support. Resources are also available from Institute's research fund and project grants. Benefits include campus housing, superannuation, provident fund, etc.

The RBI Chair Professor would participate in all educational and training programmes of the Institute. He would also be expected to provide leadership to the Institute's young faculty in undertaking research programmes which directly contribute to the Institute's mission. The incumbent should have a Ph.D. in Economics or a record of publications in professional journals. He/She should have 15 years or more of teaching/research experience. Candidates with proven record of research in rural economics would be preferred.

Interested candidates may apply with a sample of published work to
Director, IRMA, P.O. Box No. 60, Anand 388 001, Gujarat.

Planning for a National Commission on Bhopal Gas Disaster

Six years after the Bhopal gas disaster, not only do the victims continue to suffer, but several crucial issues, such as the manner in which injuries should be evaluated for compensation, remain unresolved. A national commission should be urgently set up to go into these and other matters.

MORE than six years have passed since the Bhopal gas leak disaster, three governments have changed, yet very little has been done to bring succour to the victims of this tragedy, to effectively rehabilitate them or to draw correct lessons from this catastrophe for the country as a whole. With these observations Nikhil Chakravarty inaugurated the Second National Convention on Bhopal, held at Constitution Club, Delhi on April 8-9, 1991. The convention jointly convened by Bhopal Gas Peedit Mahila Udyog Sangathan, Bhopal Group for Information and Action, and Bhopal Gas Peedit Sangarsh Sahyog Samiti was attended by representatives of trade unions, mass organisations, women's groups, environmental groups, legal, medical and science professionals as well as political parties. Four sessions had been organised with the objective of arriving at a broad consensus regarding (a) issues arising out of the Bhopal settlement, (b) the proposed National Commission on Bhopal, (c) legislation on hazardous industries, and (d) a national action plan.

Briefly reviewing the history of the six year long battle against Union Carbide Corporation, speakers pointed out that legal proceedings against UCC were initiated by the government of India initially in the New York southern district court on April 8, 1985 and later in the district court of Bhopal in September 1986. On December 17, 1987 the district court of Bhopal ordered an interim compensation of Rs 350 crore, but the high court of Madhya Pradesh modified that order and instead granted an interim compensation of Rs 250 crore. Both the Union of India and the Union Carbide Corporation appealed against that order.

Supposedly to circumvent a lengthy legal battle, the Supreme Court by its orders on February 14 and 15, 1989 directed that there be an overall settlement of the claims in the suit for 470 million US dollars and termination of all civil and criminal proceedings. The settlement evoked widespread protest from victims' organisations, their supporters and concerned citizens from all over the country and from abroad. As a result a number of review and writ petitions were filed

before the Supreme Court. These petitions pointed out that the victims had neither been consulted nor heard in the matter, that the settlement amount was pitifully inadequate and questioned the termination of all civil and criminal proceedings. The settlement was also challenged because a petition challenging the validity of the Bhopal Gas Leak Disaster (processing of claims) Act of 1985 (by which the government of India took upon itself the sole right to represent the victims) had yet to be heard.

A special bench was set up in March 1989 to hear this petition (on the Bhopal Act) and on December 22 this bench delivered their judgment which upheld the constitutional validity of the Bhopal Act, but recognised the right of the gas victims to be heard before any settlement was made. The judges further ruled that the act did not empower the government to terminate all criminal proceedings relating to the case.

Calling the settlement of February 1989 the 'second Bhopal disaster', speakers said the settlement was immoral, wrong in law, and a sell-out. The settlement had been arrived at by placing half-truths before the court. While the initial value of all claims arrived at by the government was 3,000 million US dollars, the court was led to believe that they should decide the amount of compensation between the maximum of 426 million US dollars offered by UCC and the minimum of 500 million US dollars suggested by the government of India. Victims' groups, who had protested earlier when an attempt was made in 1987 to settle for an amount of 600 million US dollars, were not informed of this shift in the government's stand.

Supporting the settlement on humanitarian grounds the government and the court had stressed the need for immediate relief to tens of thousands of suffering victims. However, in the four years till the settlement the government had done little to provide relief and rehabilitation to the victims. The government had ignored this fundamental responsibility towards its citizens and had instead focused on getting compensation from UCC. It was only in June 1990, under the V P Singh government that interim relief of Rs 200 per per-

son per family was granted to the affected people.

The humanitarian considerations of the government were further belied when they presented the court with a completely distorted picture, grossly underestimating the magnitude and grievous impact of the disaster. Of the 6 lakh claims for compensation filed by the victims, the government placed hypothetical figures of gas victims before the court, dismissing as many as 4 lakh claims without even evaluating them. According to an affidavit filed in the Supreme Court by the MP government in July 1990, as of January 31, 1989 only 3,13,292 claimants had been medically examined until then and only 29,320 had been categorised. Thus at the time of the settlement as many as 4 lakh claims had not even been evaluated, let alone categorised. The speakers alleged that the court had, therefore, arbitrarily arrived at the number of victims and the compensation amount to be paid to them. As a substantial number of claims were evaluated after the settlement, the MP government was trying to tailor the results of the categorisation in order to obtain predetermined results. This they said was evident from the fact that several necessary tests were not being conducted in evaluating all the claims.

The callousness of the government was further evident from the fact that in arriving at the settlement amount, only eight of the 15 categories of claims originally decided upon were taken into consideration. The sad and sorry plight of the victims was merely an excuse, because even if the settlement had not been challenged, not a single victim would have received any compensation from the settlement amount even in April 1991 (over two years after the purported settlement) for the simple fact that the process of evaluation and categorisation is still not complete. Victims can claim compensation only on the completion of this process as per the order of the court in May, 1989.

The settlement was strongly criticised for quashing all civil and criminal proceedings against UCC. Till now, no comprehensive enquiry has been initiated to look into the magnitude and toxicity of the world's worst industrial disaster. Also, by ordering the settlement, the Supreme Court failed to look into questions of economic exploitation of developing countries by multinationals and their pursuit of dangerous technologies for economic gain—questions which the court itself considered of seminal and far reaching importance, and of great relevance to the democracies of the third world.

Thus six years after the gas leak disaster, victims continue to suffer without

to the case still remain unresolved. The most basic is the question of evolving a scientific and just method to evaluate nature of injuries and the number of persons injured. While the February 1989 settlement had arbitrarily decided on the number of persons falling into various categories of injured without any actual assessment having been made, the method used by the MP government was viewed as being arbitrary and unrelated to the nature of diseases suffered by the victims. The evaluation made by the State of Madhya Pradesh is a one-time exercise without any provision for monitoring and follow up. Such a system can never reflect the correct number of persons injured as it fails to take into consideration the fact that asymptomatic persons are becoming symptomatic, that the disease is progressively deteriorating, that the immune system is damaged and that such damage has cyclical manifestation, that new diseases/impairment might emerge and that there is a possibility of long-term genetic damage. The result is that they have come up with an absurdly low and unrealistic figure of the number of persons injured.

An equally vexing problem is the amount of compensation to be paid to the various categories of the injured. All compensation legislation is based on value of life, i.e., measures of income that the victim loses, and not on the nature of injury and the need for medical treatment and rehabilitation.

Another crucial issue is that the settlement vacates the order of the Bhopal district court for UCC to be obliged to maintain US dollars 3,000 million worth of unencumbered assets. UCC is now at liberty to dispose of their present assets and unless the court restores the past binding on UCC, the victims may find themselves confronted by a bankrupt corporation if not a non-existent one.

Confronted with this dismal scenario, speakers expressed a lack of trust in the bureaucracy and the government. They also felt that not much could be expected from the court. Though the Supreme Court has heard the review petitions twice—once between January and August 1990 and again from November 13 to December 18, 1990, its decision on these petitions is still awaited.

WHY A NATIONAL COMMISSION

The setting up of a national commission was also discussed at length. The Justice N K Singh enquiry commission on the Bhopal gas leak disaster was wound up by the government of MP in December 1985 without allowing it to complete its public enquiry and submit its

report. The scientific commission on Bhopal, working directly under the cabinet secretariat, apparently submitted a top secret report to the government of India on the medical effects of MIC on life systems and, by mid-1988 withdrew from the scene without making any known impact on the situation. The Supreme Court settled the entire compensation against Union Carbide without eliciting any worthwhile information either about the cause of the disaster or the medical implications of exposing Bhopal's population to the deadly toxic emission from the multinational plant. Speakers felt it was imperative that the new government provide an opportunity for the truth to emerge and justice to prevail.

The responsibilities of the commission, to be set up under parliament, were outlined as follows: (1) Collect and disseminate information regarding all aspects of the disaster from both the pre- and post-leak periods. (2) Monitor, supervise and co-ordinate all relief operations, rehabilitation programmes, medical documentation and research, irrespective of whether undertaken by State or Central agencies. (3) Assist the ministry of law to evolve and implement an effective legal strategy in both the compensation and criminal suits against Union Carbide or its officials. (4) Reorganise the entire research programme undertaken by State and Central government agencies concerning the impact of the toxic emission from the Union Carbide plant on life systems, including the human body, with the primary objective of formulating an effective strategy for detoxification and prevention of further long-term health damage to the victims. (5) Devise a scientific system of medical record keeping and ensure its implementation. (6) Redesign medical documentation and epidemiology exercises and formulate a long-term policy of monitoring the health status of the victims. (7) Ensure a community-based approach to medical relief of gas victims in place of the hospital-based system whose inadequacies are now more than evident. (8) Prepare a protocol of investigation that needs to be carried out for proper assessment of injury of the victims. (9) Evolve and monitor an integrated programme of medical, vocational and social (including psychiatric) rehabilitation of the victims. (10) Monitor disbursement of interim monetary relief and later of the damages awarded to the victims in the compensation case.

A large number of speakers including gas-affected women from Bhopal demanded that the government launch criminal prosecution against Union Carbide so as to deter future corporate malfeasance. They also called for comprehensive legislation to regulate industrial hazards, to

prevent such disasters and to evolve a comprehensive code for hazard elimination and regulation.

Since the Bhopal tragedy there have been several legislative acts and amendments but these ignore the important lessons of the Bhopal gas disaster. Perhaps the most important was the Environmental Protection Act of 1986, which brought poisonous substances under its purview. However, this act has several flaws. The distinction made under the act between 'pollutant' and 'substance' is highly dangerous as it allows endless judicial quibbling. Further, the act reveals a fundamental misunderstanding of the nature of hazards by making all its categories exclusive rather than inclusive; it thus fails to take into account the fact that technologies constantly change and new hazards and processes develop, as well as the fact that our knowledge of hazards is still in its infancy.

Similarly, where the act deals with the setting up of standards to maintain the quality of the environment, it fails to define terms by which such standards are to be set, taking neither risk nor any wide definition of injury into account, it also fails to lay down that liability for filing information about risk should be with the researchers or their employer, as well as with the company using the process thus developed. Finally, the act is fundamentally flawed when it comes to the question of punishment/controls, relying on fines and or imprisonment, rather than compulsory compensation, ecological restitution, compulsory equity participation in share capital of the company by its potential victims, and 'positive' sanctions such as putting a company on probation.

The recently passed Public Liability Insurance Bill has also been severely criticised for its many inadequacies. Though aimed at providing immediate relief to the victims of industrial accidents and incidents occurring while handling hazardous substances, the provisions of the bill suffer from several pitfalls. Under this legislation while the victim does not have to prove any 'wrongful act, neglect or default' to receive interim relief, this relief is not in addition to compensation. Compensation is to depend on the existing tort liability which requires fault or negligence to be proved. The bill thus takes away the legal gains made after the Bhopal tragedy, particularly the judgment in the Delhi Oleum Leakage Case, where the Supreme Court had laid the principle of absolute enterprise liability for hazardous substances. Any manufacturer of hazardous or inherently injurious substance was to be held liable without having to prove fault or negligence of the defendant. The legislation has not defined 'hazardous

De-Centring the Centre Page

P R K Rao

Instead of exploring and critiquing the instability and the usurpative drive of modern scientific enterprise, the media has allowed itself to be appropriated by the ideology of modern science. The newspaper centre page exemplifies this.

THE news composed, the images recreated and the views pronounced in the *Times of India* (TOI) of May 25, 1991, exemplify how the media, instead of serving as a critique of the ruling ideology, can be appropriated by that ideology of modern science and technology to function as its cultural apparatus and consciousness industry. The centre page is par excellence in this respect. With an obvious suggestion of complacent innocence it begins with Byron: "The day without a cloud hath passed and thou were lovely to the last." Now that the last is over yesterday, the periodic poser with the implied question mark 'India after X' is elevated to the significance of a rare two-column long editorial on 'India after Rajiv'. The editorial discovers that "Rajiv Gandhi's instincts all along were sound". The soundness consisted in the early recognition that "India could never hope to enter the next century with a measure of confidence unless it massively inducted science and technology, accepted modern methods of management, opened up the economy to competition".

The decade old *jehad* cry for 'scientific temper' and the accompanying ideology of modernity made in the name of Nehru by Indira Gandhi's for a while mentor Haksar, public men of science and others of the tribe to explain away 30 years of failed developmental effort in the country with apparently one of the largest scientific human power and the heated debates that ensued were not recalled. Instead the soundness of the instinct was sought to be reinforced at the bottom right of the centre page by resurrecting from *The Times* archives the 60 year old letter to the editor on 'Scientific Investigation and India'. The letter begins by affirming the new convert's faith in the miracles of science, "It would be sheer truism to say that science is the foundation of modern life, the backbone of modern civilisation and the crown of modern culture." It concludes with the condemnation of politics because apparently "Politics in this country is deadly infectious. It is at once fascinating and easy job because Indian politics or politics in general too is mere talking *ad infinitum* and *ad nauseam* and its singular merit is that it is the shortest cut to bring a man into the limelight". As if scientific activity does not aspire to go on *ad infinitum* and *ad nauseam* regardless of the blinding

limelight of nuclear explosions, revolting degradation of the environment, convulsive dislocations of the prevailing social arrangements it unleashes in its search for ever inaccessible 'truth' of matter and in its unceasing desire for manufacturing ever new realities. As if people—even scientists and technologists—with their historically and socially differing partisan interests, thanks to science, will come to have totally shared interests at a future moment in time predetermined by science. As if the endless talking in politics which is the art of mediating differing interests can forever be silenced by the technical-instrumental rationality of modern management and the zero sum logic of competitive economics.

Instead of exploring the instability and insatiable usurpative drive of modern scientific enterprise and its incapacity to provide a telos for our lived lives, the centre page seeks to link the future of India with the future of cotton crop in its bottom-middle columns. Relying on the truths of that dismal science called economics, ignoring the by now well known disastrous aspects of 'green revolution' energy-intensive farming techniques, the 'Current Topics' advocates the introduction of the allegedly more rational choice of high yielding single variety of superior seeds if necessary by governmental enforcement. It wants us to believe that the urban rural nexus thus provided through this major cash crop is dynamism.

Karkaria's 'Shove in Shimla' provides a delightful, if romantic, escape from such dynamism, called Mallitude sickness when specialised to the modern consumerist hordes summer holidaying in mountain resorts.

Then comes the doyen of the media, Sham Lal, on to the 'National Scene' with his 'A System in Distress'. He has all the tools and techniques needed—Habermas, Gadamer, Foucault, Derrida, Daniel Bell, Leszek Kolakowski to name a few of the more powerful ones. He identifies that the root cause of the distress is the failure of the political system. He sees that "it will be once again the same rot affecting the nerve and bone of the system" even if the elections do not produce a hung parliament. But then he does not go beyond suggesting some unhelpful commonplaces like 'enforcing' fiscal and political disciplines, or the necessity of consensual or strict-adherence-to-the-rules-of-the

game mode of democratic functioning or the desirable capacity of some gifted one in position to take a decision and make it stick based on sufficient authority, moral or otherwise. For, in this 'crisis situation' what the society needs is a new paradigm, a new ideology, or world-view if you will, that will render possible fiscal and political disciplines, democratic functioning, moral or other authority adequate to the tasks of lived life in that society. Whether India as a society will succeed in finding such a paradigm which can help it found a new identity, a new stability and a new meaning to growth only the future will reveal. Meanwhile one would expect that accomplished men like Sham Lal would facilitate the emergence of a new paradigm by performing the necessary critical task of demystifying the ideology of modern science and technology while not throwing the baby along with the bath water. Unfortunately however, it would seem that they are hindered in that task by their oscillation between affirming the 'end of ideology' thesis prematurely celebrated in the early sixties, and rejecting the capacity of human aggregations not to eliminate but to escape the irreducible element of the 'irrational' in any ideology. When they swing to the 'end of ideology' thesis pole they construe modern science and technology as offering the unique non-ideological, self-sufficing rationality that can meet all the needs of the society and serve as an infallible critique of every ideology, and assume that politics can be subsumed under modern management techniques. Hence the editorial certificate of the soundness of Rajiv's instincts. Hence Sham Lal's irritation with the ideologues who claim that "when genuine grievances are allowed to fester for too long (we are told) they cannot but explode into violence". For sure we do know of numerous instances when long is not long enough to precipitate an explosion of violence depending on the incapacitating 'invisible' violence against those who nurture the grievance. In fact the article 'Denying the Right to Minimum Wages' by Bunker Roy in the right most columns of the centre page provides an example. According to Bunker Roy, Mandatta Singh, brother-in-law of V P Singh, in-charge of the rural development portfolio in Shekhawat's government in Rajasthan has publicly proclaimed that he never paid minimum wages to any one irrespective of the law. Not merely this Roy neatly summarises his 'story' with "To protect a corrupt *sarpanch* against whom there is a written evidence of an illegal act, to prevent the payment of a mere Rs 4,000 to 12 hungry and impoverished workers, to send a clear message to petty officials that they should carry on their corrupt practices in JRY, the State government has squandered lakhs of rupees on pointless enquiries, site inspections by engineers,

sending the police from Udaipur to forcibly lift the hunger strikers and take them back to Udaipur.' And he points out that in Rajasthan the maximum wage is actually the minimum wage.

Instead of exploring the conditions in and the causes by which grievances do or do not explode into violence, Sham Lal distracts himself with the unyielding question whether "the grievances of the Sikh youth in Punjab are more genuine and gone unredressed for a longer period than of youth in Bihar and West Bengal or for that matter, in any other State?" To the extent he can be said to subscribe to the 'end of ideology' thesis he would have us believe that he has the universally acceptable non-ideological rational criteria by which he can answer his own question in the negative. In fact he must surely be aware of the difficulty involved to overcome which he switches to an unconvincing rhetoric: "There are millions in the country without a job, without even a room to live or without someone to take care of them in sickness or old age. Should they all take to the gun?" He knows that they all have not taken to the gun, whether or not they should, whereas the Sikh youth have not only taken to the gun but their terrorist organisations have grown and they have not been politically isolated--the two counts by which Sham Lal adjudges the political system to have failed. In both situations political dialogue does not exist. In one case it has almost not been initiated and in the other it has nearly become impossible. The millions for whom Sham Lal is understandably concerned entertain the hope that the dialogue will soon be initiated because they believe their cognitive interests and material practices are not considered illegitimate or incompatible with those of the rest of the society. Politics is still possible as long as they share with the rest of the society the basic interests and practices if not the same rights, privileges and responsibilities. In the case of Sikh youth, presumably, the differences have become unbridgeable. Perhaps violence is the only thing the state and Sikh youth can exchange. Violence is the refusal by both parties to adjust their respective incompatible cognitive interests and material practices. Politics is the readiness to consider that adjustment. Maybe the tension between violence and politics, given the diversity of cognitive interests and material practices of human formations, can never be overcome. But then human beings are neither intrinsically a violence-seeking or violence-shunning animals. And as of now they have not altogether lost their capacity to subject to critique their own and others' ideological convictions and material practices. Their capacity for talking *ad infinitum* and *ad nauseam* is almost real. They have as of now the ability to put themselves into the shoes of the other and watch things and

events of the world in which they know, they are embedded along with the 'other'. Except of course the cognitively centred, fixed paranoid people like the unknown author of the six-decade-old letter from the archives. Violence is neither inevitable nor arbitrary. Violence and politics are two sides of the same coin and how often violence shows up depends on the shifting bias of the coin as determined by historically changing complex of cognitive and material forces which, if at all, can only be estimated very crudely.

Even so it can perhaps be said with a fair degree of validity, violence is more likely to occur in a society in which the compulsions for being fascinated by the ideology of modern Western science and technology are considerable and the society does not have enough critical resources to resist it. This is particularly true of Third World countries in which, because of the essentially alien character of that science and technology, it is not perceived as an ideology even by its intellectual community. Notwithstanding the numerous functional successes of modern science and technology based on its instrumental-technical rationality, the status of scientific theories is riddled with problems at the ontological, methodological and epistemological levels. The confidence of the scientist and the lay person alike in the non-ideological character of modern science is simply misplaced. But owing to its great many functional successes--although the list is shrinking after the renewable resource limitations and environmental degradations are beginning to be noticed--the ideology of modern science creates two illusions on a scale which hitherto no other ideology has been able to accomplish. The first consists in the belief that modern science and technology can secure unlimited material prosperity and unceasing progress for all humanity. The Third World countries, given the abject level of poverty that obtains in them, are easily taken in by this whereas the truth of the matter is, as reports after reports of UNCTAD, ILO

have shown, that modern science and technology can help meet only the growing material needs of some and that too at the expense of the others. To attend to the civilisational, cultural and spiritual needs of humankind is well beyond its capacity.

The second illusion that it creates is the insane idea that peace can be achieved through an abundant deployment of ever more sophisticated instruments of violence which modern science and technology can help manufacture. Hence the desperate anxiety with which nations and terrorist organisations alike seek to match each other's violence to usher in regimes of peace as they construe them to be. Under the disrupting impact of modern science and technology, the more inchoate and inadequate our once valid conceptions of sovereignty, autonomy, identity, nation, constitution and the like become, the greater will be the necessity to place reliance on the use of violence to secure peace and stability within the framework of our destabilised conceptions.

Nothing that is said above is meant to deny the obvious benefits mediated pursuit of the ideology of modern science and technology can bring to the society. But only to suggest that if the baby should not be thrown out along with the bath water we cannot also afford not to throw the bath water for fear of throwing away the baby either. For, such is the human condition. We are no less vulnerable to our so-called latest knowledge systems as we were to our now discarded ideologies that claimed the status of knowledge systems much the same way the present ones do. We have to somehow muddle through and as of now we have not lost that pragmatic capacity. And it is for our senior media persons and their disciples, as it is for anyone engaged in the public space, to resist that tendency to conflate our capacity to muddle through with a capacity for acquiring a non-ideological master-key to the riddles of our individual and collective universes no matter how

Poverty and Income Distribution

Edited by

K S Krishnaswamy

While there has been over the years a perceptible increase in per capita income and expenditure and possibly some decline in the incidence of poverty in India what still remains is massive and of a kind that is not remedied quickly or smoothly. Even with radical policies the shifts in income and occupational structures to make a serious dent on it will take more than the rest of this century. In the welter of recent exchanges between the government and the opposition as well as between planners and market advocates on the strategy of growth these issues have been largely obfuscated. It is therefore more than ever necessary today to recognise the magnitude of the problem and the inadequacy of the measures adopted so far to deal with it.

vehemently our knowledge-producers may claim to be in the possession of such a key and no matter with what abrasive confidence our men of action in their search for that key assert the soundness of their instincts

Failure to do so, given the power of the media in the public space, would not only mean the appropriation of the media by the dominant ideology but also to detract from what little capacity we still possess to muddle through. An illustration of this, whether intended or not, is provided by the letter to the editor of the *TOI* under the title 'BJP's attraction'. Seized with the phenomenon of a large number of retired military personnel and other high ranking defence officers joining the BJP, Kapahy, the author of the letter argues that "it is only natural for retired military personnel to join the BJP because it offers a continuation of the ideology that they had been practising while in service. Nationalism, patriotism and dedication to duty and discipline are the cornerstones of the defence services". An unquestioning, uncritical acceptance of the ideologies of nationalism, patriotism, duty and discipline may or may not be alright to the army personnel qua army personnel. With so many of them in BJP the distinction between BJP and the defence services will cease to be relevant. Such unflinching commitment from them as members of the party BJP, whether or not that party comes into power, in a situation in which each one of those once meaningful ideologies are unrelentingly being destabilised, under the unsuspecting impact of the ideology of modern science and technology, to signify different and incommensurable things to different people, can only lead to continued impossibility of any dialogue of politics and thereby a correspondingly increased reliance on violence through Operation Blue Stars and terrorist massacres and assassinations. When that happens or when it is already happening the media cannot absolve itself of its complicity by issuing certificates of soundness of instincts or publishing Kapahy's letters or reproducing 60-year old letters from its archives in its centre page. To do so would be to add fuel to the fire while pretending to extinguish it. Sham Lal in his article laments the ascendancy of the 'irrational' in national politics. One would have thought that in politics there is no scope for the 'irrational' if one is anxious to retain the original sense of the term. In politics there can be differences of opinions and interests, and the desire to sort them out through dialogue for purposes of action is what makes politics politics. When that desire does not obtain there is no possibility of politics, we have the surd, the irrational and the incommensurable. Violence is an expression of the surd. Is there an ascendancy of the surd in the centre page of the national press?

NOTICE LARSEN & TOUBRO LIMITED

It is hereby notified for the information of the public that Larsen & Toubro Limited propose to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of section 22 of the Monopolies and Restrictive Trade Practices Act 1969 for approval to the establishment of a new undertaking. Brief particulars of the proposal are as under:

| | |
|---|---|
| 1. Name and address of the applicant | LARSEN & TOUBRO LIMITED Registered office — L&T House Narottam Moharjee Marg Ballard Estate Bombay 400 018 A/c 31 03 90 |
| Capital structure of the applicant organisation | Rs. 80 00 00 000 Issued capital Rs. 68 08 44 060 Subscribed capital Rs. 68 08 44 060 |
| 3. Management structure of the applicant organisation indicating the names of the directors including the managing whole time directors and manager if any | The company is managed by the Managing and whole time directors subject to the supervision and control of the Board of Directors |
| Names of Directors | Chairman Emeritus Managing Director & Chief Executive Officer Managing Director designated as President Joint Managing Director Wholetime Director designated as Vice President |

| 4. Indicate whether the proposal relates to the establishment of a new undertaking or a new unit/division | New manufacturing unit is sought to be established. The proposal relates to manufacture of gear boxes/torque multipliers as diversification within the current annual licensed capacity of 40 000 nos. of hydraulic & pneumatic equipment in the existing manufacturing unit. |
| 5. Location of the new undertaking unit/division | Village: Byatarayanapur District: Bangalore State: Karnataka |
| 6. Capital structure of the proposed undertaking | Not applicable |
| In case the proposal relates to the production, storage, supply, distribution, marketing or control of any goods/articles, etc.: | |
| 1) Name of goods/articles | Gear boxes/Torque multipliers |
| 2) Proposed licensed capacity | 600 nos. within the existing overall licensed capacity of 40 000 nos. per annum of hydraulic & pneumatic equipment. The proposal does not envisage creation of new capacity. |
| 3) Estimated annual turnover | Approximately Rs. 120 lakhs at full capacity. |
| 8. In case the proposal relates to the provision of any service, state the volume of activity in terms of usual measures such as value, income, turn over, etc. | Not applicable |
| 9. Cost of the project | Rs. 30 lakhs by way of additional working capital. |
| 10. Scheme of finance indicating the amounts to be raised from each source | The project will be financed by internal cash accruals from existing operations. |

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

Dated this 13th day of June 1991

Images of Women and the Feminine in Maharashtra

Meera Kosambi

The series of international conferences on 'Maharashtra: Culture and Society' has, over the years, produced scholarship remarkable for its depth as well as breadth, allowing an appreciation of what is uniquely Maharashtrian while treating the region as a microcosm of the Indian subcontinent. A report on the fourth conference which was devoted to the theme 'Images of Women and the Feminine in Maharashtra'.

THE interplay, correspondence and contradictions between the images and the reality of women in Indian society have continued to intrigue scholars and citizens alike for a long time. An in-depth exploration of this phenomenon was recently done in the context of Maharashtra, stressing the images as they affect and shape reality—images of women and the feminine from ancient to the present times, as reflected in folk and Sanskrit traditions, as expressed in spontaneous unself-conscious outpourings and in ideological polemic. The forum was the Fourth International Conference on Maharashtra Culture and Society, organised by Anne Feldhaus at the Arizona State University, USA, from April 6 to 8

I

Regional conferences are likely to arouse, as an automatic reaction, apprehensions of parochialism and local chauvinism. However the series of International Conferences on Maharashtra Culture and Society has, over the years, successfully refuted these fears by producing scholarship remarkable for its depth as well as breadth, allowing an appreciation of what is uniquely Maharashtrian while treating the region as a microcosm of the Indian subcontinent.¹ This latest conference succeeded the previous ones in the series held at the Universities of Toronto (March 1984), Poona (January 1987), and Heidelberg (June 1988). The very wide spectrum of topics discussed at the first two conferences had inevitably led to a grouping of papers around two themes at the third conference.² The fourth conference confined itself to only one specific theme 'Images of Women and the Feminine in Maharashtra'. Another innovation, made in the interests of encompassing indigenous vernacular scholarship, was the provision that presentations and comments could be made in English or Marathi, and that English summaries of Marathi contributions would be made available.³ The sharp substantive focus,

with its wide ranging appeal, helped not only to transcend the regional demarcation, but also to cut across cultural boundaries. The assembled scholars also brought with them a diversity of their own disciplinary and regional cultural backgrounds to the conference whose international scope may be judged by the fact that the 23 participants who presented papers were drawn from six countries in four continents (11 from the USA, seven from India, two from Canada, and one each from Germany, USSR, and Australia), in addition to other participants who were present mainly in the capacity of observers (three from the USA, and one from Canada). It may also be of interest, given the theme of the conference, that 12 of the paper givers were women and 11 men.

The tone of the conference was set by the preliminary note circulated by Anne Feldhaus which clearly outlined its objectives.

India, the land of *sati*, dowry deaths, and female infanticide and suicide, is also one of the very few modern nations to have had a woman as its prime minister, as well as in extraordinary number of women in top positions in a wide variety of fields. The plight of the lowly Indian daughter-in-law has its inverse reflection not only in her powerful mother-in-law, but also in the goddesses of Sanskrit literature and village shrines. A nation which has had female suffrage since Independence, India still allows women agricultural labourers to be paid significantly less than men. In this conference we propose to investigate some of the images of women and femininity that underlie these and other seemingly contradictory facts. We plan to study such images as they are found in the Marathi language traditions of Maharashtra.

In investigating the images of women and of femininity, we will not be studying the lot of women, but rather one important set of conditions which have influenced women's lot. We will not be listing the 'famous women of history' rather, we will be studying the ways that men (and those women whose thoughts have been recorded) have viewed femininity and power, status, and potential

of women. We will be studying not so much actual women as ideas.

Some of the most prominent Indian ideas about women and the feminine are to be found in the classical literature of the Sanskrit tradition, as well as in English language materials. Important though these sources are for an understanding of Indian views of women and the feminine, our conference will focus on local and regional levels of the tradition in an effort to discern grassroots views, views that are widespread in a local rather than a geographical sense. In order to do this in India, it is absolutely necessary to work with materials in the regional languages. Hence our focus on Maharashtra, and on Marathi language materials.

Our conference will be interdisciplinary, with special emphasis on the fields of religion, literature, anthropology, sociology, and history. Religious studies specialists will focus on goddesses and on conceptions of women's sacred powers. Literary historians and critics will be concerned with feminine images in the writings of men and women Marathi authors from the thirteenth century to the present. Economic, political and social historians will concentrate on views of women's status, powers and abilities that have been influential, or in some cases have failed to have an effect, in the public arena. And anthropologists and sociologists will present studies of views of women current in the rural and urban areas of Maharashtra.

The conference is not likely to produce an exhaustive or definitive account of Maharashtrian images of women and the feminine, nor is it likely to bring about a consensus on the relationship between such images and the realities of women's and men's lives. Nevertheless, the conference will undoubtedly provide an occasion for its participants to search out new materials, reinterpret old ones, and develop fresh perspectives on Maharashtrian culture and society.

II

The conference was fittingly inaugurated by a keynote address by Suma Chitnis, vice-chancellor of the SNDT Women's University, Bombay, following the welcome addresses on behalf of the Arizona State University by the associate dean of the Graduate College and by the director of the Centre for Asian Studies. These addresses initiated the presentations of papers and intensive discussions organised into five panels over two and a half days.

The Identity of Maharashtrian Women' was the theme of the keynote address by Suma Chitnis, which presented a historical perspective on the Maharashtrian women's quest for their own identity, drew parallels with developments elsewhere in India and in the West, and posed questions for further exploration. The dissonance between the current democratic ideology and commitment on the one hand and reality on the other is striking all over the world. The Judeo-Christian

ideology in the west is patriarchal as is the predominantly Hindu ideology in India, but the context is different. The problems are identical, but the responses have had to be different and culture specific. The cry for liberation is universal, but its substance is different. Within India, again, regional variations abound. What has constituted feminism in the Indian, and specifically Maharashtrian, context?

Historically, Maharashtrian women have provided several distinct categories of feminist responses.⁴ Firstly, there were the saint poets (e.g. such as Rahinabai, Janabai, Mahadaya, who trod a path different from the saint poetesses of the north (exemplified by Meerabai). Secondly, women from royal and aristocratic families of the seventeenth to the nineteenth centuries, such as Shivaji's mother Jijabai and Ahilyabai Holkar, shone as capable administrators. Thirdly, Pandita Ramabai presented the unique case of an indomitable individualist and committed social reformer fighting for women's emancipation in the late eighteenth and early nineteenth centuries. Fourthly, women like Ramabai Ranade (Justice M. C. Kanade's wife) and Anandibai Joshi (the first Maharashtrian lady doctor who received medical training in the USA in the 1880s) followed in their husbands' footsteps but also travelled their own paths. Fifthly, Tarabai Shinde was a little known solitary figure of a totally articulate woman who sought to dispel stereotypical male prejudices about women: an unusual phenomenon in the 1880s. Sixthly and finally, there has been a group of activists in the twentieth century, including Geeta Sane who worked with dacoits, Godavari Parulkar who organised tribals, Mrinal Gore who is a political force, and Medha Patkar who has figured so prominently in the Narmada agitation.

This set of responses spans a wide spectrum. It is the cry for autonomy, space, visibility, equal access to all spheres of life and freedom to express thoughts and feelings. It is also a battle about biology, a battle to be liberated from a socially constructed biology. How does all this relate to the current feminist movement? The articulation of feminism post dated World War II, but its reality spanned several previous centuries of quest. It displayed in a variety of ways, the courage of women to step out and 'do their own thing' in spite of the loneliness it involved, to keep company with their cause at the risk of being isolated. Today feminism in India has reached a point where living with one's cause is the most important thing. How does the Western woman face this challenge?

Another important element involved in the process is to move out of the trappings

of the body. From the feminist perspective it is a woman liberating herself from the body. What does it achieve? Over the generations, the woman's response has changed from being awkward and shrinking into her body to being proud of her body. In Maharashtra, women have traditionally used very little ornamentation (*shringar*) of the body, compared to women in other parts of India. Maharashtrian women have been dowdy, and have moreover been proud of being dowdy. Special measures (such as cutting off salt) were taken in the past to stunt bodily growth in order to facilitate marriage. In extreme cases such as widowhood, bodily disfigurement (especially shaving off the head) was common or rather, mandatory. Attitudes have changed now to such a degree that today *shringar* appears on a large scale among women of the younger generation. But to what extent is it a liberation, and to what extent a narcissism born out of loneliness?

Outstanding women of the nineteenth century, like Ramabai Ranade and Laxmibai Tilak⁵ were devoted wives who 'followed after'. After their husbands' death, they came into their own, but on the path earlier chalked out by their husbands. Progressive husbands of the time encouraged their wives' freedom, but in order to further their own careers. Women of today are trying to strike out on their own. It is their liberation but it threatens the traditional family institution. Concepts of liberation, again, are culture specific. In India 'selfhood' and individuality for women mean learning to contain conflict within oneself, in the West it means the ability to fulfil one's self.

The choices available to women today are a set of alternatives, without their being right or wrong. But the real question is of a different order: these choices involve an inner psychological battle—in addition to the political battle with the existing socio-economic structure.

III

Panel I 'Images of Women in Marathi Literature' was an exploration of male writers' perceptions of women and of women writers' self-perceptions. Mahadev Apte (USA) in his paper 'Male Playwrights and Female Characters: Are Marathi Plays about Men or Women?' started with a set of premises: that there exist dominant socio-cultural gender role models for women, these models create social behavioural constraints on women, conflicts occur because women's desire for self-development through fulfilment of personal ambitions clashes with societal gender role related obligations and responsibilities, failure to conform to these societal expectations result in strong

negative attitudes towards women; sexual inequality and the overall dominance of men over women is all-pervasive; and men perceive women as sexual objects for pleasure and exploitation. Men's attitudes to women in general pivot around the basic contradiction that women as members of the family are to be protected, but women as members of society are to be exploited. These attitudes were analysed through the plays of Jayawant Dalvi, a popular contemporary Marathi playwright, who portrays the urban middle class world. A recurring theme in Dalvi's plays is that the woman is primarily a wife and a mother, and can achieve fulfilment only through this role, the moment she steps outside the domestic sphere and takes up a job, the stability of the family is disrupted.

A somewhat different set of attitudes underpinned the writings of a popular contemporary poet, according to Philip Engblom's (USA) analysis in 'Woman and Goddess in the Poetry of P. S. Rege'. The most common reading of Rege's poetry emphasises his absolute surrender to the physical charms of women and his incapacity to view women as mothers. Understandably, this has evoked two contradictory types of male reactions: one which applauds his celebration of female sensuality in the socially sanctioned male dominant tradition, and the other which condemns it as male chauvinism. The female response to Rege is more complex, and suggests that the usual mother-child duality is irrelevant in Rege's case. Rege's poetry thus lends itself to a profoundly different interpretation revolving around the woman as *shakti* emphasising the feminine in the divine and the divine in the feminine.

Travelling back in time to the devotional poetry of the 'Varkari' tradition, Irina Glushkova (USSR) analysed 'The Concept of Woman in the Poems of Tukaram'. Two basic premises underlie these poems: one being the parallel between God and Mother concomitant with the parallel between Bhakt (devotee) and Child, the other being that the concept of woman is dichotomised into the two categories of 'Aspired for' and 'Repulsed'. In this poetry, the mother-child relationship between God Bhakt has been expressed allegorically, by identification, and metaphorically, where God possesses all the attributes of a mother—unselfish love, protectiveness, and nurturing. In this manifestation as a mother, a woman is 'Aspired for'. Her anti-thesis, a woman as woman or as wife, is a perennial source of carnal temptations. Furthermore, a woman who does not have a child (e.g. a barren woman, a harlot) is to be especially avoided because a woman who

does not desire to give birth to a child is, by definition, immoral. This entire category of women is to be 'Repulsed'. Thus the relationship of the Bhakt to women contains an antithetical duality: the Bhakt-Mother relationship is highly valued, while the Bhakt-Woman relationship is shunned as a symbol of danger. This duality suffuses Tukaram's poetry.

Women's self-expression through poetry provided a refreshingly new angle against this backdrop, with the added dimension of the oppressed castes, in Eleanor Zelliot's (USA) paper 'A New Voice: Dalit Women's Poetry'. The sophisticated poetry of a few educated Dalit women selected for analysis revealed four different but not necessarily conflicting voices: an identification with gender across caste; a sense of double oppression by caste Hindus and by Dalit men; a sense of unity as members of the Dalit movement spearheaded by Ambedkar; and a strong criticism of the current Dalit social and political leadership as lacking genuineness.

IV

Panel II 'Feminine Religious Images in Maharashtra' was opened by Mary McGee's (USA) paper 'In Quest of Saubhagya: The Roles and Goals of Women as Depicted in Marathi Vrata-Kathas'. *Vratas* are the votive performances observed primarily by women, and the body of stories related to them, though simple in narrative format, serves a more complex purpose of reinforcing the traditional duties and responsibilities of women (*stridharma*) in general, and of the devoted wife (*pativrata*) in particular. Most of the *vratas* are performed by women for strengthening their *saubhagya* which is a quality of well-being contingent upon having a living husband. The *vrata-kathas* or *kahanis* tell of women rescuing their husbands from accident, disease, or even death (though rarely of men rescuing their wives), and impart two subtle additional messages. First, that marriage itself is not enough to maintain *saubhagya* but that children are also essential; and secondly, that *vratas* possess a central significance and power to enhance *saubhagya*.

A specific *vrata*, that of Rishi-panchami which is also celebrated as a festival in Maharashtra and southern Gujarat, was singled out for study by Tara Bhawalkar (India) in 'The Taranetar Pilgrimage, Rishi-Panchami, and the Changing Image of Women'. It is customary in Maharashtra that on the Rishi-panchami day, no food obtained by the labour of bullocks is to be eaten. This custom and the associated *vrata* were interpreted, on the basis of the symbolism of the existing folklore, as a celebration

of the natural creative power of women dating back to the time when agriculture was primarily the woman's responsibility and when bullocks were not yet used for cultivating the soil.

'All the God's Wives' by Gunther Sontheimer (Germany) focused on Khandoba (an earthly incarnation of God Shiva) and the songs sung about his five wives: the first wife Mhalsa, of the Lingayat merchant caste (often identified with Parvati); Banai, the shepherdess (often identified with Ganga); Phulai of the gardener caste; Rambhai, the tailor woman; and Chandai Bhagvani, the Muslim woman (or sometimes the woman of the oilpresser caste). Rambhai (sometimes identified with Banai) is the semi-divine 'Murali' or temple dancer. The songs traditionally sung in Maharashtrian villages by bards (*Vaghyas*) and temple dancers (*Muralis*) on special festive occasions are a mixture of entertainment and spirituality dwelling upon, among other things, the portrayals of the five wives of Khandoba, their personalities, inter-relationships, jealousies—and, through all these, the Maharashtrian folk images of women.

The cult of the 'Muralis' or temple dancers was further explored by John Stanley (USA) in his paper with the same title. Over the centuries, the Muralis, with their ritual circuit of singing, dancing, miming, and begging, have kept away from prostitution; in fact, many of them are married women. In the *bhakti* poetry of the saint poet Eknath, the sexual imagery of the Murali has been sublimated into a self-surrendering devotion to God Khandoba (also supposed to be her husband). In many villages the special all-night vigil (*jagaran*) to celebrate a marriage requires the performance by a Murali to bless it for fertility, strength and prosperity.

Shifting from the marital to the sibling relationship of the gods, Anne Feldhaus (USA) read a paper on 'Goddess as Sister. The Case of Bhivai'. Goddesses having male protectors or servants abound in Maharashtra mythology, but the goddess Bhivai having the god Dhuloba as her adopted brother is an unusual case in that it is she who assists him in killing demons and in winning his wife. She also takes ritual precedence over him. Mythology contains two types of divine pairing: the usual marital pairing where the husband is dominant, and the other type where the goddess is ascendant. But this brother-sister relationship (by definition non-sexual, non-marital, and non-jealous) reflected in the Bhivai-Dhuloba case has no element of subordination or domination. Even the stories of their mutual challenges show no rivalry. To what extent this image is a projection of the normal or normative ideal in social reality is a

moot point. The fact remains that the brother-sister relationship is the only cross-gender, intra-generational, close but non-sexual relationship available to men and women.

Finally, the mother-son relationship was examined by James Laine (USA) in his paper 'Shivaji's Mother'. In the life of the great Maharashtrian hero Shivaji, his mother Jijabai is said to have played a crucial role especially in his formative years, moulding his political aspirations and religious disposition. (Her influence was reinforced by the fact that Shivaji's father Shahaji was living elsewhere with his second wife during this son's childhood.) This strong mother-son bond was examined from a psycho-analytical approach, using both historical and legendary biographical material about Shivaji, and in the light of the traditional Maharashtrian household in which a son often grows up with the contradictory and ambivalent image of his mother as nurturing but also as over-protective and demanding.

V

Panel III 'Images and Conditions of Women in Maharashtra in the Eighteenth, Nineteenth, and Early Twentieth Centuries' traced the social reality of relatively recent times based largely on archival materials. N K Wagle (Canada) prefaced his paper 'Women in the Kotvali Papers' with the observation that the common image of the female as inherently deceitful and of the male as her victim underlies the laws prescribed in the *Dharma-shastras*, but the social reality of the Peshwa times projected a far different code of behaviour as revealed in their records. The Kotval, an important officer of the Peshwa, was required to keep a register of all offences, including sexual misdemeanours (such as adultery, abortion, rape, etc., grouped under the term *badkarma*) which formed a sizeable proportion. The paper discussed four types of sexual misdemeanours citing a large number of cases recorded during the 1770s and 80s: illicit relations, pregnancy arising from illicit relations and resultant abortions, rape and violence (including wife-battering), and the loose behaviour of women slaves. The judgments in these cases were based on concrete proof (gossip alone being insufficient), a consideration of all relevant circumstances, and relative freedom from gender bias requiring both partners to pay equal penalty (although double standards did exist, while at the same time men were often charged higher fines and the woman's honour was upheld).

The Peshwa documents provided the data also for Stewart Gordon's (USA) paper 'Remarriage in the Eighteenth-century Maratha Polity' which concen-

KALIMATI INVESTMENT COMPANY LIMITED

whereby to inform the information of the public that Kalimati Investment Company Limited proposes to take an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (1) of Section 25 of the Monopolies and Restrictive Trade Practices Act, 1969 for approval to take over part of the share capital of Stewarts and Lloyds of India Limited. Brief particulars of the proposal are as under —

(i) Name and address of the applicant

Kalimati Investment Company Limited
 15, Ambrosia,
 2, Hill Mounty Street,
 Fort, Bombay 400 001

(ii) Name and address of the undertaking the whole or part of which is proposed to be taken over and the manner of take over

Stewarts and Lloyds of India Limited
 59,000 equity shares of Rs. 10 each of
 Stewarts and Lloyds of India Limited
 11, Chowpatty Road,
 Fort, Bombay 400 001

(iii) Managing management of the applicant

The Company is managed by the Board of Directors

(iv) Capital structure of

(a) the Applicant

Kalimati Investment Company Limited

(b) the undertaking proposed to be taken over

(v) Line of business of the undertaking which will or is likely to emerge as a result of the proposed take over

No new undertaking will emerge. Stewarts and Lloyds of India Limited produces industrial pipework and also takes contracts for pipework construction.

(vi) Consideration for the take over

It is proposed to acquire the shares at a price of Rs. 10 per share.

(vii) Scheme of finance indicating the source(s) of finance for the proposed take over

It is proposed to finance the acquisition through the internal resources of the Company.

Any person interested in the matter may make a representation to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, Dr. Rajendra Prasad Road, New Delhi, within 14 days from the date of publication of this notice intimating his views on the proposal and indicating the nature of his interest therein.

Dated this 17th day of June 1991

DIRECTOR

trained on northern Maharashtra. The state required widow-remarriage (*pari*) to be registered along with the payment of a special fee or tax (*patdam*). A wide range of castes, including Brahmins, seems to have allowed this practice. The paper concluded that, firstly, the position of widows in the Maratha polity was such as to provide, in spite of the extremely negative view of widows, several possible alternatives, such as staying on in the husband's house, returning to the parents, or re-marrying (*sati* not being the norm). Secondly, the state was intensely involved in family and caste matters, in contrast to the later British regime; and the fate of the widows was important to the state. Thirdly, the post-Peshwa British colonial regime witnessed such a social change that great debates were held about the permissibility of widow remarriage, with the British government referring to the sacred Hindu texts to provide the necessary criteria, but not to the existing practice.

Anne Waters' (USA) 'Predicament of Women: Recovering Women's Experience from Eighteenth Century Historical Fragments' analysed five cases of offences against women (four suicides of daughters-in-law, and one murder) from the Peshwa records. They shed light on the family structure and politics of marriage, especially the fact that the state power extended into the family and other institutions. In the actual trials, the punishment, if not justice, was contextual, and included penance as well as a fine adjusted to the family's financial condition. The restitution of the family's ritual status was also a major concern. In attempting to recover the experience of the women concerned, it has to be realised that the situation of daughters-in-law was generally stressful, the most critical period being that between marriage and the birth of children. This leads to the interpretation of these suicides as a form not of rebellion but of marginalisation, caused not by role-failure but by over-emphasis.

J C Masselos' (Australia) paper on 'Sexual Property and Sexual Violence: Wives in Late Nineteenth Century Bombay' focused on the nature of cohabitation and conjugal rights, and whether or not British law applied to these. (An interesting sidelight was that the Peshwa courts had held both the man and the woman culpable in cases of conjugal offences, while the British system usually punished the woman.) The norm of the perfect Hindu wife and the actual practice did not always match; in spite of general conformity, some women tried to escape the established pattern and encountered social sanctions. In this connection, the domestic structure of power and violence was also considered.

Meera Kosambi (India) combined the interaction between the indigenous social

institutions and British legislation, with the different perspectives on women in the late nineteenth century, in her paper 'Child Brides and Child Mothers: The Age of Consent Controversy in Maharashtra as a Conflict of Perspectives on Women'. The upper-caste Hindu custom of pre-pubertal marriage for girls and immediate post-pubertal consummation of marriage through the 'conception ceremony' (*garbhadhan*) reflected the patriarchal view of women as primarily wives and mothers. This was challenged by social reformers who were instrumental in initiating the Age of Consent Bill in early 1891 and its almost immediate passage into an Act. Its purpose was to lay down the minimum age limit of 12 for girls at the time of cohabitation. The heated controversy ranged over a variety of issues: the correct interpretation of the ancient sacred texts, and the nature of contemporary practice; the harmful effects to the child bride (such as physical injury leading even to death), to her family (by causing barrenness or producing weak, sickly children), and to the society at large (by producing a population weak in physique, intellect and morals, which could be easily subjugated by a foreign colonial power); and the validity of foreign interference in Hindu domestic matters. What the new Act achieved, in addition to the physical and emotional welfare of the girl bride, was the legitimacy of a new and more humane (though not non-patriarchal) perspective on women.

VI

Panel IV 'Views of Women in Modern Maharashtrian Social Thought' revolved largely around three prominent women: Ramabai Ranade (1862-1926), Pandita Ramabai (1858-1922), and Tarabai Shinde (1850-1910). Sarojini Vaidya (India) in her paper 'Reform from Within and Without' examined two central and diametrically opposite tendencies in social reform in Maharashtra: namely, attempting to generate internal change in society, and attacking it from the outside. The two tendencies found their respective adherents among all the leading social reformers (almost entirely male) of the late nineteenth century. More interestingly, they were also represented by two of the very few leading women of the age. Ramabai Ranade, who ran the Seva Sadan in Pune after her husband's death, followed the traditional ideal that a woman's upliftment lay in the service of others. Pandita Ramabai, on the other hand, discarded both the Hindu norms of womanhood and the Hindu religion itself (through her conversion to Christianity), and promoted the ideal of the self-reliant woman. Ramabai Ranade's approach conformed to the mainstream social tradi-

tions and therefor bore fruit; while the Pandita's reform violated these traditions, antagonised society, and thus failed to bear fruit.

A comparison of the writings of Pandita Ramabai and Tarabai Shinde formed the central theme of the two papers (originally planned as a joint paper) by Vidyut Bhagwat (India) and Jayant Lele (Canada). Bhagwat's paper '*Stree Dharma Neeti* and *Stree-Purusha Tulana*: The Inner Unity of the Two Texts' outlined the subaltern approach and described the two books concerned. The former is a guide-book on morals and manners for women by Pandita Ramabai, and the latter a comparison of women and men (including a scathing attack on the negative male attitudes about and treatment of women) by Tarabai Shinde. Although the two texts appeared simultaneously in the early 1880s, they clearly reflected the authoresses' very different backgrounds. Pandita Ramabai, brought up as an orthodox Brahmin, was then in a transitional stage, having veered away from Hinduism towards the Brahmo-Prarthana Samaj on the way to Christianity; while Tarabai Shinde, a high-caste Maratha woman, was influenced by the Satyashodhak movement of Jyotirao Phule, with its emphasis on caste conflict and other forms of social discrimination.

Lele's paper 'The Modernity of Subaltern Consciousness: Some Reflections on Caste and Gender Through Pandita Ramabai and Tarabai Shinde' was framed within the context of the world capitalistic system, the decline of the British hegemony, changes in the economic domain, and their impact on the socio-cultural domain. Starting from the mid-nineteenth century, the era of optimism about the future development of India through colonial intervention gradually gave way to scepticism by the end of the century. But both Pandita Ramabai and Tarabai Shinde were located within the tradition of optimism characterised by 'modernity'. In this connection, the notion of 'reflexivity', or response to an alien culture, was discussed. The colonial encounter was clearly a shock to both the parties involved, but the early Maharashtrian intellectuals produced a 'modern' critique which involved a critique and appreciation of the other as well as of the self. It was this universalism and reflexivity which was kept alive by the two women, and it was the reflexivity in terms of liberation from gender oppression which united them.

Rajendra Vora (India) emphasised the political context of the struggle for the women's cause in 'Conservatism and the Status of Women in Maharashtra'. Conservatism emerged in nineteenth century Maharashtra as a response to the colonial socio-political intervention and to the ideology of liberal social reformers which

centred around improving the upper caste family and marriage institutions and enhancing the status of their women. In the last quarter of the nineteenth century the Conservative programme gradually established itself as a viable alternative in political as in social matters in Maharashtra. As its foremost champion, Tilak systematically opposed reforms such as female education, widow remarriage, ban on child marriage, and other measures aimed at bettering the status of women. By the end of the century, Tilak's viewpoint had become the dominant viewpoint, and the women's cause was relegated to the background.

VII

Panel V was labelled 'Women in (on) temporary Maharashtrian Villages and Towns'. Sharon Kemp (USA), in 'Women as Bullocks: A Self image of Village Women', showed that in contrast to the well known and dominant images of Indian women as wives and mothers, village women have constructed a model about themselves as bullocks. Within the context of their everyday lives and economic activities, bullocks provide an apt metaphor especially regarding the issues of work, autonomy, and control. Both women and bullocks are perceived as strong, touched only by the *Malak* (a term which ordinarily means the owner, but which is also used to refer to the husband), separated from the outside world, and kept under control (including sexual and procreative control, through castration for a bull, and through the birth-control operation for a woman). Control can be exercised also on another level through a young woman being yoked to an older woman (mother in law) who can withhold food and administer beatings. Work alone entitles both the woman and the bullock to food, and both must please the *Malak*. Both are considered to be dull-witted, and the muteness of bullocks is paralleled by the loneliness of women who are not allowed to talk to other women and often not even to visit their natal families. The same women recognise that men's work is hard and requires mastery over animals, but their life is perceived as being easier because it is not controlled and has the freedom of birds. The women see this freedom in stark contrast to their own lack of it.

Lee Schlesinger (USA) examined other sets of images expressed by villagers in relation to the women who live there, in his paper 'Women in and of the Village: Two Instances from Western Maharashtra'. Two different types of source materials were used to analyse these. The literary source was a recent Marathi short story about a woman teacher who joins a village school and then asks for a transfer

almost immediately: the villagers react with mild curiosity and gossip but not with sympathetic interest, their chief concern being the possible reflection this episode might have on the village reputation. The ethnographic source was the ritual celebration of the festival of Nag-panchami in which the social divisions within the village community played an important part. These two specific situations focus on the place and significance of women in relation to the external reputation and internal organisation of a village. They also raise some broad conceptual issues about social structure and theory relevant to the analysis and representation of gender (and/or women) in Maharashtrian social life and culture.

Maxine Berntsen (India) presented the real life story of a woman from one of the most oppressed castes, in 'Sharada: A Mahar Woman's Path to Selfhood'. Sharada's life paralleled that of the majority of her sisters in terms of misery and in social and economic marginalisation, but her uniqueness lay in her power to overcome the obstacles in her own way. After the customary early marriage, Sharada continued her education in spite of oppression from her husband and in laws. When she attained sexual maturity, her husband no longer wanted her and eventually remarried. In spite of this rejection, she made repeated attempts, over a twenty year period, to be acknowledged as his wife because of the internalised ideal of the woman as a wife and mother. During this time while she developed the power to digest unhappiness, she also obtained job skills and economic self-reliance, and got involved in politics through the Ambedkar movement. Spiritual sustenance was provided by the family's legacy of the Mahanubhav tradition. Sharada's story provides a glimpse of the struggles of an oppressed woman from an oppressed social stratum, and of the development of her personhood and capacity to cope, in the rich social context of the caste realities, the ideology of womanhood, and the prevalent religious and political streams. From the Western standpoint, Sharada is a 'not liberated' woman. But in the Indian sense, she is liberated—she may have fallen short of her goal, but she has attained selfhood.

VIII

In the concluding discussion which rounded off the conference, the major themes which emerged through the papers and discussions were recapitulated. These included the role of Brahminism (*vratas*, pilgrimages, etc), the role of patriarchy defining the household as the focal point of women's existence, the role of colonialism, whether perceived positively as a

liberating influence or negatively as a theatre of oppression; the structure of the polity, economy, and culture; women as subjects as opposed to objects, and the nature of modernity in the context of oppression and liberation.

It was felt by some that a compromise had inevitably been made with the original objective of the conference, namely, to investigate the images of women and of femininity, to focus not on the lot of women but on the perceptions of women which have influenced their lot. Another reaction was that the Brahminical and urban women's perspective was dominant throughout the conference, and that the other world views which also co-exist in Maharashtra did not receive the same attention. This was probably due to historical reasons: the effort to improve the status of women among the upper castes has gone on for a hundred and fifty years, but has been very limited among the lower castes whose women tend to be self-reliant but not free of male dominance.

In spite of these differences, the fact remains that the awareness of the asymmetrical man/woman relationship is very clear and strong among the women of Maharashtra, across social and spatial divisions.

Notes

- 1 The proceedings of the First International Conference on Maharashtra have been published in two volumes: *Religion and Society in Maharashtra* and *The City, Country and Society in Maharashtra*. The proceedings of the Third Conference are currently in press in two volumes.
- 2 The two themes were 'Folk Culture, Folk Religion and Oral Traditions as a Component in Maharashtra Culture' and 'Reformers, Writers, Editors: Transformation of Maharashtra Culture 1830-1930'. For a report of the Third International Conference on Maharashtra see 'In Search of the Indian Concept of Tradition' by G. Sontheimer and M. Kusanibi, *Economic and Political Weekly*, September 3, 1988, pp. 1835-36.
- 3 This provision however was utilised only in a small way. Only one paper, by Tara Bhavalkar, was presented in Marathi, and the comments and discussion in Marathi were also limited.
- 4 The names and contributions of women who have made a mark in Maharashtra through history may not be familiar to non-Maharashtrians. Unfortunately, it is not possible to give a fuller background in a report of this nature. Some details, however, will appear in the descriptions of the actual papers.
- 5 Laxmibai Tilak was the wife of the Rev. Narayan Vaman Tilak who is described as a Christian saint poet of Maharashtra. Her famous Marathi autobiography *Smriti-Chitre* has been translated into English with the title *And I Follow After*.

IMF-World Bank Recipe for Soviet Economy

R G Gidadhubli
Abhijit Bhattacharya

In the context of the openly expressed view of the Soviet leadership that economic assistance from the West is critical to Soviet economic survival, the report on the Soviet economy jointly prepared by the IMF, the World Bank, OECD and the European Bank for Reconstruction and Development and its recommendations assume special significance.

AMONG the various responses and reactions in the West to Gorbachev's perestroika for the Soviet economy, the report published under the joint auspices of the four leading international economic organisations, namely, the IMF, World Bank, OECD and European Bank for Reconstruction and Development (in short, IMF-WB report) is very important. The report is quite comprehensive as it analyses all aspects of the Soviet economy and the recommendations are significant as the implicit objective is to evaluate conditions under which the big financial institutions in the West should extend financial support to facilitate the Soviet efforts in implementing economic reforms. While developments in the USSR are taking place very rapidly and make any analysis or recommendation a formidable task, the IMF-WB report may retain substantial relevance in the long term for the Soviet economy. Hence it is worthwhile to examine the essence of the IMF-WB report and the recommendations they make for the Soviet economy.

In the first instance, an effort has been made to analyse the overall development of the economy under the leadership of Gorbachev. As per the IMF-WB report, initiatives undertaken in 1985-87 were more in the nature of campaigns (anti-alcohol campaign, acceleration campaign, etc), but economic growth was affected by the decline in world oil prices (oil being a major export-earner for the country). The economy was stagnating while money supply increased and the fiscal deficit rose from 2.5 per cent in 1985 to 8.5 per cent in 1987.

During 1987-88 among the major reform measures were the enactment of the Law on State Enterprises giving greater autonomy to firms and decentralisation of foreign trade activity. However, in practice the system of state order and inflexibility of prices continued which negated the reform laws. On the external economic front there was deterioration caused by worsening terms of trade and growing domestic im-

balances. External debt in hard currency shot up to \$ 54 billion in 1988.

While the rate of growth of capital stock, net investment and output of essential industrial goods declined, the military burden remained significant. The concentration of the highest quality of labour and material inputs in the defence sector seriously retarded the growth of productivity in civilian production. However, the policy of converting defence industries for civilian goods was gaining momentum in 1988-89.

ECONOMIC DECLINE

In 1990 it was becoming evident that perestroika had failed to halt the secular deterioration of economic performance with the fall in NMP by 4 per cent and GDP by 2 per cent. The rate of inflation was about 12 per cent with excess liquidity estimated at Rbl 250 bn, i.e., about one-third of the stock of financial assets. The budgetary deficit was about 8.5 per cent of GDP and was a major source of money creation. The USSR could not take advantage of the rise in the world oil price due to a decline in domestic production of oil. For the first time in Soviet history, unemployment was informally estimated at 1.5 per cent of the labour force.

The hard currency BOP deficit was \$ 14 bn and out of foreign exchange reserves and accumulation, arrears to foreign suppliers was estimated at \$ 5 bn. Gross external debt in convertible currency was to decline to \$ 52 bn. Trade with the non-convertible area was in deficit due to decline in oil exports. Quoting Soviet sources it is noted that BOP in convertible currency worsened, particularly in 1989 (-\$ 3.7 bn) and 1990 (-\$ 14 bn projected) as compared to 1986 when it was +\$ 0.6 bn. Similarly, non-convertible BOP position also worsened during the last five years, from +\$ 1 bn in 1986 to -\$ 6.6 bn in 1989. This shows the overall deterioration of the external financial position of the USSR.

On the whole, NMP growth rate in

1986-89 was 2.7 per cent as compared to 3.2 per cent in 1981-85. This declining trend got accentuated in 1990. Even as per official estimates, NMP growth was to go down to -4 per cent. In fact many Soviet and Western specialists opine that real growth of the Soviet economy has been negative during 1986-90.

As per the IMF-WB report, the traditional centrally planned system had collapsed but had not been replaced by the market system. Growing imbalance between money supply and supply of goods resulted in too many roubles chasing too few goods. Domestic trade system was collapsing with barter arrangements becoming common among republics, regions and even cities. There was a growing shortage of consumer goods.

In an effort to marketise the Soviet economy, alternative programmes for transition were presented to the Supreme Soviet in 1990 which differed in modalities, timing and sequencing of reforms. However, on the question of transition to market there was no alternative. For economic transition four stages were identified: (1) stabilisation of the economy and beginning of commercialisation and privatisation; (2) gradual liberalisation of prices, introduction of social safety net and maintenance of tight financial policies; (3) introduction of structural reforms, and housing market; and (4) achieving convertibility of rouble and opening up of Soviet economy for foreign companies.

These stages were in fact contained in the 'Guidelines for Stabilisation of the Economy and Transition to a Market Economy', a framework for a reform programme spelt out by Gorbachev. The programme is essentially a gradualist one which also envisaged price reform, both wholesale and retail. Under this programme subsidies on retail prices were to be reduced. Distortions in relative prices at producer and wholesale level were to be reduced administratively in 1991. It is observed in the report that Soviet privatisation policy was vague and lacking a specific time horizon and that it may be stretched to a long period. Soviet industrial restructuring may lead to reduction in employment in industry by between 1 and 6 million persons.

In the IMF-WB report an effort has been made to analyse the problems facing different sectors of the economy. On the agricultural sector, the report points out the following major shortcomings: (a) wastage and losses are heavy, ranging from 20 per cent in the case of grains to 40 per cent in that of fruits and vegetables which equal the quantum of imports; (b) losses arise due to shortages of packaging material, storage facilities, prevalence

of outdated processing technology and inadequate and poor transport facilities; (c) irrational price structure has led to heavy subsidies, causing excess consumption demand and affecting production efficiency; and

(d) about one-third of total investment in the economy has been diverted to the agricultural sector during last 25 years and yet its development has suffered due to wrong priorities and macro imbalances.

As regards the energy sector which is a crucial one for the Soviet economy as the main foreign exchange earner, the report points out that the policy of energy exploitation has relied upon techniques aiming at short-term expansion at the cost of long-term recovery prospects. Besides inefficiencies in production, transport and storage problems are affecting this sector. Pricing of energy is highly irrational, oil prices for consumers being lower than the cost of production and world market prices (Soviet domestic oil prices are \$ 40-53 per metric ton as compared to world prices of \$ 200). This has led to wastage and uneconomical use of energy resources at consumption level and lack of incentive at production level.

The manufacturing sector in the USSR, it is observed, is characterised by concentration of production leading to monopolies, mismatch of demand and supply, excessive administrative control over production units, inadequate infrastructure and managerial personnel, and so on.

THE CHOICES

In the opinion of the IMF-WB specialists, Soviets have two alternative approaches for economic reforms—a conservative approach and a radical one. In the conservative approach there is emphasis on tight or restrictive fiscal policy while prices remain under administrative control and structural changes take place at a slow pace. The radical scenario emphasises a macro-economic stabilisation programme with the intention to reduce the budgetary deficit to a level below 2-3 per cent of GDP, decontrol of prices and privatisation of small-scale enterprises.

The authors of the report have recommended the radical approach as the appropriate strategy for the USSR although they are aware of certain consequences for the economy—there will be hardships for consumers, particularly for some vulnerable groups, price decontrol may lead to a wage-price spiral and large monopoly profits, there may be undue burden on enterprises. To overcome these consequences, remedial measures are suggested during transition period to the market—for instance, retaining price control over public utilities and housing, promoting greater domestic and external

competitiveness, and so on.

Among various important recommendations made in the IMF-WB report are

- (a) a hard budget constraint on government expenditure to eliminate various forms of budgetary and extra-budgetary support to loss-making enterprises;
- (b) a more integrated approach to manpower and wage policies for the government sector;
- (c) higher interest rates for effective monetary control;
- (d) absorption of excess liquidity through monetary reform by freezing part of financial assets held by households and enterprises, by reducing the real value of assets by price increases and by sale of financial assets of longer maturity (bonds) or shares or of physical assets;
- (e) opening up of the economy to foreign competition through trade liberalisation which requires, among other things, introduction of a realistic and unified exchange rate, reduction of trade and BOP deficits, phased introduction of convertibility of the rouble and introduction of separate foreign exchange markets in each of the major republics;
- (f) income policy be made effective with wage determination being left to collective bargaining, protecting purchasing power of incomes through indexation and wage tax being supplemented by a ceiling on wage increases;
- (g) freeing of prices to guide allocation of resources, comprehensive price decontrol to eliminate shortages and macro-economic imbalances; introduction of market clearing prices and transition to world prices;
- (h) agricultural reforms to be directed to price liberalisation, land reforms with emphasis on privatisation, disbanding state and collective farms, termination of state orders, phased withdrawal of state distribution of agricultural inputs, encouragement to small scale and co-operative production, improvement in infrastructure facilities, including development of all weather roads, etc, and promotion of joint ventures with foreign collaboration in food processing activities with introduction of modern technologies;
- (i) elimination of monopolies and creation of competitiveness among production units, dissolution of branch ministries, elimination of restriction on range of products, introduction of commercialisation and privatisation for the transition to market economy, facilitating growth of small business sector; and
- (j) revision of prices of fuel and energy

resources to increase export potentiality of energy resources (1 per cent reduction in domestic consumption will lead to \$ 1 bn increase in export earnings), improvement in field management practices and secondary recovery techniques, creation of favourable investment climate for foreign investment and know-how; it is also proposed in this context to the Soviet government that fuel deposits may be leased out to attract foreign investors.

There is an unambiguous recommendation for privatisation as a part of the strategy for successful transition to market economy of the USSR. It is noted in this context that before substantial privatisation was implemented, the locus of ownership of state property must be conclusively determined either through a new union treaty or some other means. This is considered important since the experience in the recent past showed that decisions taken by the Soviet government with regard to leasing and private farming ran into difficulties in the absence of clarity as to the locus of ownership of land.

THREAT OF POLITICAL BACKLASH

Although specialists who have prepared the IMF-WB report have met several Soviet policy-makers and organisations in the USSR, there is no reference to some of the important reports published in the USSR itself. For instance, on June 21, 1990 the Soviet government had instituted a committee of 24 members under the chairmanship of Abel Aganbegyan to 'Evaluate Alternatives for the Transition to a Market Economy'. Among its members were Nikolai Shmelev (vice-chairman), Oleg Bogomolov, Tatyana Zaslavskaya and A Emelyanov. The commission published its report in October 1990 (*Voprosy Ekonomiki*, No 10, 1990, Moscow, pp 109-148). According to this publication, the proposals put forward by the Soviet economists fall into three broad categories: (1) variants of non-market development, (2) market extremist variants, and (3) variants for the transition to a regulated market. Though the third category of variant itself can be divided into various sub-categories (from conservative to radical versions), the IMF-WB recommendations broadly fit into the third group. Similarly, there is no reference to the Ryzhkov, Shatalin plan and so on.

The IMF-WB report has not given specific suggestions or recommendations to certain key problems of reform. For instance, when the Republics are at loggerheads with the Centre over the question of resource sharing, the report has only acknowledged the importance of a

new framework of inter-governmental fiscal relations. Though the IMF-WB specialists support a system which gives each level of government autonomous and well-defined revenue raising powers, the Soviets may not buy this idea considering their present level of about 9 per cent deficit and little possibility of it being brought down to 2½-3 per cent in the short run. On the other hand, they are aware of the fact that decentralised fiscal policies have given a boost to budgetary deficits in various countries.

On the question of the 'monetary overhang' which has assumed huge proportions causing the present macro-economic imbalances, the IMF-WB has mentioned three alternative approaches (or some combination of them):

- (1) through monetary reform which would confiscate or freeze a part of financial assets held by households and enterprises,
- (2) by letting the real value of existing financial assets be reduced by price increases; and
- (3) by sales of financial assets of longer maturity (bonds or shares) or of physical assets.

Although debate has been going on in the USSR on these issues, Soviet prime minister Pavlov introduced an ill-conceived and badly managed demonetisation of 50 Rbl and 100 Rbl notes in March 1991. His demonetisation measure, which was meant to fight black marketeers and 'Western saboteurs', inadvertently hit hard the genuine embryonic Soviet private sector and new class of entrepreneurs which has shaken their confidence in government policy. Added to this is the price revision and partial price liberalisation in April 1991 which may turn inflation into hyperinflation.

In other words, while IMF-WB alternatives are not infeasible, they require further preparation and have to be weighed against the possible political backlash. Regarding the second element of the above mentioned alternatives, valuation of assets in the absence of a real capital market is a serious practical problem which may create tension as was evident in the case of Hungary.

On the question of systemic issues the necessity of an early price reform has now been accepted by more or less all the reformists. In this regard the IMF-WB suggestion is interesting for its practicability since it throws some light on how to squeeze the already miserable population. This has to be done since there is no other alternative.

On the whole, unlike various already published proposals for reform the IMF-WB recommendations seem to be more coherent since any radical reform of the

whole system has to be a package deal with logically interconnected elements. The report has highlighted one very important aspect (though very briefly) which is extremely important in a grandiose social experiment like perestroika. That is, the speed and timing of the reform. The opportunity cost of implementation of various elements of the reform changes very fast with time. If one element is not introduced at the right moment, at a later stage the same step may throw the whole system into a tail-spin if politically and economically much tougher back-up measures are not taken simultaneously. Pavlov's April 1991 price revision is an example of this. In 1987-88 this reform measure could have given some tangible results when a financial crash was not looming large over the Soviet economy. The IMF-WB report rightly mentions that "the speed and sequence in which they [macro-economic stabilisation, price reform and ownership reform] and the necessary accompanying legal and other measures are introduced will determine the cost: of the initial adjustments, and the speed with which the benefits of reform are through".

The IMF-WB recommendations on foreign direct investment are in tune with its well known recipe for all closed or semi-closed economies. Since joint ventures are supposed to do magic in international business, the IMF-WB specialists have advised the Soviet Union to create necessary condition enabling multinational companies to operate freely in the Soviet economy. In fact, foreign investment may not contribute significantly to Soviet gross domestic product and to improving other macro-economic indicators, though foreign collaborations may have an educative function for Soviet managers and entrepreneurs who will learn how the cream of the capitalist world operate in a real market.

Postscript

The Soviet economy is passing through crisis of historic dimensions. The situation has worsened as compared to early 1990 when the IMF-WB report was prepared. For instance, according to Soviet official data, as compared to the first quarter of 1990, the growth performance in the first quarter of 1991 was as follows: GNP - 10 per cent, national income - 6 per cent, industrial production - 9 per cent and agricultural production - 13 per cent. The decline in Soviet foreign trade was even worse with imports declining by 45 per cent and exports by 18 per cent.

Against this significant decline in economic growth, there has been a sharp increase in money supply. In the first two

months of 1991 it was 88 billion roubles against 11 billion roubles in the corresponding period in 1990. Thus inflationary pressures are further building up aggravating the crisis in the country. Added to these are problems arising out of Centre-Republic relations over the new Union treaty, sharing of economic resources and political power, and the declaration of independence by six republics from the Union.

While the task of finding a temporary solution to these issues looks very formidable, Soviet economists and policy-makers are also confronted by the need for an unambiguous choice of a model for their economy. There seem to be only two probable alternatives. Either to continue the old system and improve upon it or to abandon the socialist system and accept capitalism (be it in the form of the *laissez-faire*, convergence or any other model). But the problem of making such a choice lies in the fact that sufficient theoretical work has been done neither on the improvement of the socialist system (for many economists it is even futile to work in this direction since they are convinced that the efficiency of the Hungarian economy is the limit of what a socialist system can achieve) nor on the transition from socialism to capitalism. It is indeed a great challenge to the leadership of the Soviet Union to select and work out a theoretical and practical framework for one of these two alternatives. Right now the trial-and-error method seems to be the official approach.

The Price of Security

S R Sen

Unless something drastic is done to arrest the growth in defence, police and other non-development expenditures, India is likely to miss the second technological revolution and world trade boom that seems to be in the offing in the Nineties, just as she had failed to take advantage of the enormous technological changes and world trade expansion of the Sixties

IN spite of the Second World War and the post partition riots, India's expenditure on external and internal security, viz. defence, police and general administration, remained reasonably low in the Fifties compared to many other countries.

In 1950-51 defence expenditure was 1.8 per cent of GNP (Rs 168 crore/Rs 9,325 crore), police expenditure was 0.6 per cent of GNP (Rs 56.9,325 crore) and 'other non-development' (OND) expenditure (largely general administration excluding interest on public debt and defence and police) was 2.4 per cent of GNP (Rs 224.9,325 crore). These ratios were even lower prior to the Second World War. The British policy of maintenance of the buffer status of Afghanistan, Tibet and Thailand, command over the sea routes, strategic defence and prompt drastic police action during emergencies made this feasible. Potential backing from strategically located government forces enabled a small posse of troops or even unarmed constables to keep peace.

In the interest of development, Pandit Nehru succeeded in maintaining these low ratios up to the China War. In 1960-61 defence expenditure was 1.7 per cent of GNP (Rs 281/16,129 crore), police expenditure was 0.6 per cent of GNP (Rs 99/16,129 crore) and other non-development expenditure was 2.2 per cent of GNP (Rs 355/16,129 crore).

The China and Pakistan wars substantially changed all that. In 1965-66 defence expenditure was 7.4 per cent of GNP (Rs 885/25,981 crore), police expenditure was 0.7 per cent of GNP (Rs 190/25,981 crore) and OND expenditure was 1.8 per cent of GNP (Rs 479/25,981 crore). For people in the Planning Commission in those days, it was a traumatic experience to dismantle the Third Plan and divert resources from development to defence purposes. They tried to partly compensate for this by cutting down OND expenditure from 2.2 per cent to 1.8 per cent of GNP.

But these two unfortunate wars did in fact much greater real damage than these

figures by themselves indicate. India failed to take advantage of the new technological revolution and world trade boom of the Sixties unlike Japan and Germany.

Severe drought, devaluation, the Bangladesh war and the oil crises followed in quick succession and the Sixties and Seventies turned out to be two bleak decades for India. By 1980-81 defence expenditure was brought down to 2.8 per cent of GNP (Rs 3,867/1,36,157 crore) but police expenditure went up to 0.9 per cent (Rs 1,163/1,36,157 crore) and OND expenditure went up very substantially to 3.1 per cent (Rs 4,286/1,36,157 crore). Corresponding figures for 1970-71 were 2.8 per cent (Rs 1,199/42,879 crore), 0.8 per cent (Rs 335/42,879 crore) and 2.5 per cent (Rs 1,071/42,879 crore), respectively.

Throughout the Eighties, the earlier restraint on defence, police and OND expenditures was very much relaxed although there was no war or other special emergency. In 1989-90 defence expenditure went up to 3.3 per cent of GNP (Rs 14,350/4,33,500 crore), police expenditure to 1.0 per cent of GNP (Rs 4,460/4,33,500 crore) and OND to a very high level of 4.3 per cent of GNP (Rs 18,506/4,33,500 crore). The total of these three items stood at 8.6 per cent of GNP (Rs 37,316/4,33,500 crore) in 1989-90 as compared to 6.1 per cent of GNP in 1970-71, 5.9 per cent of GNP in 1965-66 and 4.8 per cent of GNP in 1950-51. The budgetary gap not covered by revenue went up from Rs 12,282 crore in 1980-81 to Rs 45,600 crore in 1989-90. In contrast with the revenue surplus and balance of payment surplus of the Seventies, there was a colossal deficit in both in the Eighties. India's total external debt which stood at \$20.6 billion or 11.9 per cent of GNP in 1980 went up to \$62.5 billion dollars or 23.3 per cent of GNP in 1989 and is much higher now. The country is facing severe domestic inflation, budget crunch and foreign exchange crisis.

It appears that unless something drastic is done to halt this rake's progress, India

is likely to miss again the second technological revolution and world trade boom that seems to be in the offing in the Nineties (somewhat comparable to that in the Sixties), without any excuse like war or famine this time.

SOME REMEDIAL MEASURES

The minimum that needs to be urgently done is to revert at least to the 1980-81 ratios if not to the 1970-71 ratios, of non-development expenditure, including defence, and implement the suggestions for reducing bureaucratic delays made in the article 'Too Late and Too Little' (EPW June 18). This can be done partly by augmenting the denominator and partly by reducing the numerator. Legal, procedural and financial constraints on Indian NRI and foreign investors should be removed or reduced if they undertake to earn net 10 per cent more of foreign exchange than their total foreign exchange liabilities per annum or over a specified period, irrespective of how much they sell in the domestic or foreign markets. While special incentives may be provided for products designed for export markets, their domestic consumption should be curbed, if necessary by excise duties rather than physical controls. Special free trade cum free foreign exchange zones should be set up for attracting entrepreneurs from, say Hong Kong or the Gulf region. Any net inflow of foreign exchange especially from NRIs, should be free from personal income tax and related hassles. The national benefit would then far outweigh hypothetical departmental loss. These and other comparable measures would help considerably to augment our GNP and foreign exchange earnings and bring down the three ratios mentioned above.

It would help substantially to bring down these ratios if very careful annual scrutiny is undertaken of each important element of our defence, police and OND expenditure.

So far as the last two, viz. police and OND expenditure, are concerned, it would help if a 'zero based budget' procedure is followed and the Estimates Committee of parliament considers these as specially susceptible to Parkinson's Law and therefore priority areas for its scrutiny. Every item of additional personnel and facilities since 1980-81, if not 1970-71, should be carefully checked. Each time more efficient modern equipment is asked for, appropriate economy in obsolete or surplus equipment and personnel should be insisted upon.

INDIA IS A RELATIVELY MORE LITIGIOUS field because it is usually regarded as a 'holy cow'. There are in this country very few MPs and competent analysts who specialise in defence matters. Foreigners are often able to collate more data from various sources which are now denied to our own MPs and analysts. Government would do well to provide at least such information as is now being collated by foreigners to those Indians whose credentials are above board. Many senior defence officers themselves have expressed serious concern about the Parkinsonian growth of defence expenditure in undesirable and counter-productive directions, and are themselves recommending greater analysis and scrutiny by experts from outside the establishment.

Annual scrutiny needs specially to be made about the 'teeth-to-tail' ratio and the composition of the 'teeth' in our defence forces.

'Teeth' in particular have to be very different for 'blitzkrieg' and conventional war. For the latter, self-sufficiency is undoubtedly important. But for countering the former, our defence forces must have the most up-to-date and efficient 'teeth', whatever be the source. Since many of these are subject to rapid obsolescence, the populist slogan for self-sufficiency for these also may be very risky. We must periodically update these items of 'teeth' up to a reasonable critical mass in the light of our risk perception and provide adequate resources for this purpose.

Relatively small but well-trained and well-armed forces, with the most modern and highly effective 'teeth' (as in say, Israel), when used boldly in minimum critical mass and against carefully identified vulnerable points of the enemy, have usually proved much more successful than large inadequately trained and armed forces which have lacked such teeth. This is a lesson of history which we can ill afford to forget.

We should have no compunction in getting rid of any equipment or personnel adjudged unequal to the challenge faced in such a life and death matter as war. If the potential enemy knows our preparedness and determination to hit back very hard at any place and time of our own choice and inflict unacceptable damage on him, that alone should prove an effective deterrent and help avoid war. Whether he plans overt aggression or covert subversion, the knowledge that our retaliation will be prompt and drastic (or more than equivalent) would make him prefer a peaceful resolution of his differences with us. Readiness to take calculated risk and strategic deterrent action is also a useful way to keep down the cost of defence.

LESSONS OF HISTORY

India has repeatedly suffered in the past because Indians were not careful enough in this regard.

At an informal discussion, an American defence specialist once observed that the Indian soldier has usually been among the best in the world. He referred to the Duke of Wellington saying that he had faced the toughest challenge of his career at Assaye against the Marathas and not at Waterloo against the French. But Indian commanders were often defeated because they depended unduly on large ill-equipped armies and were unfamiliar with the latest weapons and strategies evolved in other parts of the world. The American specialist's British counterpart added that Hindus had written tomes on the art of warfare and were often brave fighters but they lost most wars against foreign conquerors because they were too rule-bound and unable to react effectively enough against the surprise moves of the enemy.

The *Encyclopaedia Britannica* says: "The subjection of a whole sub-continent containing a unique civilisation has long been a source of historical wonderment [this was] made possible by the innate divisiveness of Hindu society, rent by class and caste divisions, which rendered it unusually willing to call in unwelcome outsiders to defeat the still more unwelcome neighbour. The foreigners, asked in the first resort to assist in defeating a rival, were in the last resort accepted as masters in preference to dominance by a rival. Thus Marathas preferred the British to the Mughals or Muslims, and the Nizam, the British to the Marathas. Long historical memories can be inhibiting as well as inspiring. Britain enjoyed the advantage of overseas reinforcement through its sea power. A lost battle for the British was an incident in a campaign for the Indian prince, usually the end of the chapter. Then there were the technical advantages of arms and military discipline and the immense general advantage of a disciplined civilian

by the rising self-confidence of the Europeans in general. For the Hindu, on the other hand, his world was at its lowest ebb—in the Kali or dark age—while the Muslim believed in inscrutable fate."

These observations may not represent a thorough analysis. Nevertheless, they contain important elements of truth which deserve to be carefully kept in view when considering questions of our external and internal security. Our present lack of 'disciplined civilian morale', fratricidal 'caste and class divisions', turning to 'unwelcome outsiders to defeat the still more unwelcome neighbour', extreme political confrontation and factionalism, undue reliance on 'large ill-equipped' security forces and bureaucratic inability to 'react quickly and effectively enough' against surprises resulting partly from some special features of the sub-continental policy and partly from our social milieu, all indicate that the shortcomings highlighted by these commentators still persist although we are now in the fifth decade of our independence.

Yet it need not be so. Our geopolitical position in Asia is somewhat comparable to that of Switzerland in Europe *vis-à-vis* the relevant big powers. We could learn valuable lessons from the security and diplomatic policies of that country, which is no doubt much smaller but has faced comparable problems of heterogeneous society and querulous neighbours. These policies which are less moralising and more down to earth compared to ours have enabled Switzerland to enjoy an enviable long period of peace and prosperity at relatively low defence and police cost. If we do that, we need not seek international leadership. International esteem will automatically come to us as it has come to Switzerland.

But for this to happen, our various deficiencies noted above need to be clearly recognised and appropriate corrective actions initiated by our statesmen as early as possible.

AUDITOR'S REPORT ON THE INDIAN BRANCH OF THE BANK OF NOVA SCOTIA UNDER SECTION 30 OF THE BANKING REGULATIONS ACT, 1949.

We have audited the Balance Sheet of the Indian Branch of The Bank of Nova Scotia Incorporated with limited liability in Canada as at March 31, 1991 signed by us under reference to this report and the relative Profit and Loss Account of the Indian Branch of the Bank for the year ended on that date annexed thereto with the books of account maintained and produced to us at Bombay and report as under:

- a) the Balance Sheet and the Profit and Loss Account have been drawn up in accordance with the provisions of Section 29 of the Banking Regulations Act 1949 read with Section 211 of the Companies Act 1956
- b) we have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory.
- c) the transactions during the year which have come to our notice have been in our opinion within the powers of the Indian Branch of the Bank
- d) in our opinion proper books of account as required by law have been kept by the Branch so far as appears from our examination of these books
- e) the Accounts of the Indian Branch of the Bank dealt with by this report are in agreement with the books of account
- f) in our opinion and to the best of our information and according to the explanations given to us the Accounts together with the notes thereon give the information required by the Companies Act 1956 in the manner so required for Banking Companies and on such basis give a true and fair view in the case of the Balance Sheet of the state of affairs of the Indian Branch of the Bank as at March 31, 1991 and in the case of the Profit and Loss Account of the profit of the Indian Branch for the year ended on that date

BOMBAY 22nd June 1991

1 FOREIGN CURRENCIES

Assets and Liabilities in foreign currencies are translated into Indian Rupees at the rate current at the Balance Sheet date. Resultant gains or losses are taken to the Profit and Loss statement. Transactions during the year are translated into Indian Rupees at the rate current at the date of transactions. As per the present practice of banks in India, the Foreign Currencies Non-Resident Account balances are valued at the Balance Sheet date at the rates specified by the Reserve Bank of India at the date of the transaction and not at the currency rates current at the Balance Sheet date.

2 INVESTMENTS

The bank values all investments it intends to hold at the lower of cost or market value and purchase cost after amortisation of discount or accretion of premium from the date of purchase to the maturity of the investment. Till last year the basis of valuation was at cost amortised as above. The effect of this change is the reduction in the value of investments by Rupees 1 34 444.

3 FIXED ASSETS

Fixed assets are stated at cost less accumulated depreciation. Depreciation is on a written down value method at the rates specified in Schedule XIV of the Companies Act 1956. Rupees 1.1 million payable by the bank in respect of purchase of its premises shall be accounted for on the matter being resolved in a court.

4 ADVANCES

- a) Provisions for doubtful advances have been made to the satisfaction of the auditors in respect of identified advances based on a periodic review of advances and after taking into account the portion of advance guaranteed by Deposit Insurance and Credit Guarantee Corporation, the Export Credit and Guarantee Corporation and similar statutory bodies.
- b) Provisions have been made on a gross basis. Tax relief which will be available when the advance is written off will be accounted for in the year of write off.

5 STAFF BENEFITS

Provisions for gratuity benefits to staff has been made on an accrual basis.

6 NET PROFIT

The net profit disclosed in the Profit and Loss Account is after

- i) provisions for taxes on income in accordance with statutory requirements
- ii) provisions for doubtful advances
- iii) adjustments to the value of investments in government and other approved securities in India valued on the basis stated in note (2) above
- iv) transfers to contingency
- v) other usual and necessary provisions

7 Contingency funds have been grouped in the Balance Sheet under the head Current Accounts & Contingency Accounts

8 Previous year figures have been regrouped wherever practicable

Mandalisation under British Rule in Bengal

G K Lieten

Caste, Politics and the Raj: Bengal 1872-1937 by Sekhar Bandyopadhyay; K P Bagchi, Calcutta, 1990.

MUCH of the later life, and the final assessment, of the Janata Dal government of V P Singh has been tied up with the issue of reservation in Central government jobs for members of the backward castes. The vociferous antagonists, supported by practically the entire establishment, confronted the equally vociferous but less endowed protagonists. A middle ground appeared impossible.

Strangely enough, the slanging-match was conducted without much empirical base as to how reservation in the past and in the various States had or had not caused the various distortions and aberrations, or benefits and consonance which both sides have claimed. A dispassionate debate was made impossible by the recourse to direct democracy by the powerful and by the adamancy of the pro-Mandal lobby.

It is, therefore, fortuitous that an excellent study on the politics of preferential treatment, as practised by the colonial administration in Bengal, has been published. Fortunately for Sekhar Bandyopadhyay, his book got finished before the 'Mandalisation' of Indian society took place. It has been possible to take a scholarly, detached and unbiased look at the subject.

Of course, it is not the first book on the subject. A limited number of studies have been published in the past, particularly on caste associations in South India and (by Marc Gallanter) on the changing legal framework. It stands the author in good stead that he has absorbed the secondary sources comprehensively. He has furthermore delved into archival material and has recovered, from government sources and from the files of caste associations, interesting material which should go a long way in helping us to inquire into the real motivations behind positive discrimination policies.

The wide canvas—government and the various backward castes in a mega-state over a span of half a century—has prevented the author from making a systematic search and utilisation of the archival materials of the various caste associations. This shortcoming, however, does not diminish the importance of this contribution.

Caste associations, it is admitted, have never played the important role in Bengal which they played in South India and Maharashtra. In the latter case there was a joint connecting the aspirations of the backward caste elite with the spirit of pro-

test against social humiliation and material deprivation of the community. The associations, far from being vehicles of progress and democratic politics, as the Rudolphs have suggested, in fact were vehicles of material rewards through council policies and petitions. The more these concessions were forthcoming under the benign state patronage, the less necessary it became for the leaders to continue their mobilisation of the caste community.

In Bengal, the process of patronage started in fact before the process of mobilisation and framing of caste identities could proceed beyond its embryonic stage. The intentions of the colonial administration to create a loyal leadership with a caste-based mass appeal thus clearly misfired.

The author has marshalled solid evidence to conclude that the administration from the mid-nineteenth century on increasingly realised the divisive potentiality of caste and religion, and engaged administrators like Hunter and Risley to do an ethnological mapping of the presidency as a resource base for effective social control. During the first decades of the twentieth century, the caste dichotomy was successfully turned into a political dichotomy. "the civilian ethnographic perception of a system of ritualised ethnic division of an antagonistic character thus became a reality—largely as a result of British appointment policies, constitutional and electoral arrangements, political and administrative innovations" (p 53).

Considerations of expediency prompted the government to take these measures, but the fact that it took till the middle of the 1930s for these policies to become firmly established (without actually really threatening the hold of the Rarhi Brahmins) indicates that the divisive scheme was not paramount in colonial policy. Considering the denouement of the various policy initiatives, one is left with the view that the caste-isation of politics was at least as much due to the stubborn refusal by the highest caste 'bhadralok' to allow any infringement on their exalted position in the social and political structure.

For example, when in 1932 two members of the Central Legislative Assembly introduced the Untouchability Abolition Bill, the government of Bengal, after hearing its Hindu members, advised refusal of consent to the introduction of the bill, and actually hushing up of any discussion on the civil rights of the depressed classes. At least one

civil servant suggested to the government that it would be politically preferable not to follow the high caste Hindu members and to have a public discussion since this would split Hindu society into warring groups. The fact is that the government did not follow this advice, until much later when it became politically expedient.

Bandyopadhyay is hence, in our opinion, imprudent in his indictment of the British colonial administration. There is some tendency to overstate the reach of government policies (e.g. pp 80/81: "offering all conceivable facilities to the members of the Scheduled Castes"; and p 82: "the government system of patronage distribution became dependent on caste-identity") and a tendency to understate the citadel mentality of the upper caste Hindus in not granting any of the privileges to the members of the other Indian nation.

In the introduction and conclusion, and at a few places in the main text, the author, it is fair to add, balances his approach. He observes that the continued exclusion of the Namasudras, Mahishyas, Tilis, Sahas and Rajbansis from the socio-economic privileges and the newly-aroused spirit of self-respect filled them with a sense of alienation from the better privileged higher castes and from their political agitations.

His overall conclusion, hence, reads as follows (p 203, emphasis added): "The colonial policy of protective discrimination *only contributed further* to this development... The colonial regime appeared in their consciousness to be their most trusted friend—nay their 'liberator'. Such a different perception of history, in which the colonial rule appeared to be more egalitarian than the traditional regimes of the Hindu and Muslim rulers, stood in sharp contrast to the practice of glorifying the pre-colonial past by the nationalists."

Protective discrimination, when it finally materialised for a small section of the depressed classes, then called forth the denunciation and condemnation by upper caste Hindus, some of them no doubt well meaning. They argued that the alien government, for ulterior motives, was politicising caste and was reinforcing it as a cleavage factor in society. A perfect example of a self-fulfilling prophecy: the cleavage was brought about as much, if not much more, by the unwillingness of the upper caste leaders, many of them in the nationalist movement, to concede some (symbolic) concessions.

The parallel with the recent Mandal agitation is all too obvious.

Bandyopadhyay acknowledges the philanthropic urge of the government, but gives it relatively less weightage, probably because he overestimates the degree of upward caste mobility in Bengal and underestimates the extent of real cleavage, exploitation and caste oppression. The social and economic struc-

ture underneath is hardly touched for the simple reason that the archival sources did not provide material on this aspect. The abundant archival material on other aspects, however, makes up more than adequately for this void.

Upward mobility was definitely on the cards, and the chapter on Caste and Social Mobility gives a good deal of information, but it was a mobility restricted to the uppermost families within the extensive caste—the maharajahs, zamindars, big jotedars and wealthy traders. The gap between these elite folks and the caste base was probably so vast that an integrated movement was hardly possible, the more so since the caste associations in Bengal hardly ever were a protest movement.

'Depressed Class' politics, right from the start, was aimed at the promotion of the agricultural and business pursuits of the

well-off sections, with some fall-out in terms of charity and endowments for educational uplift. They could hardly ever lose "their early protestant character" under the impact of government patronage, for, unlike in southern India, they were loyalist movements to start with and to end with. They were hence never in a position to attract a mass following and carve out vertical support structures along caste lines. Ultimately, the poor rural population went along under the banner of the Krishak Praja Party of Fazlul Huq in the eastern territories and the Kisan Sabha in the western territories.

Only a more detailed study, along the lines of Robert Hardgrave's study of the Nadars in Tamil Nadu, would explain the peculiar dynamics of politics in Bengal, sidelining the caste associations in the decades to follow. Sekhar Bandyopadhyay, with an excellent study, has brought us up to this stage.

labour productivity, reflecting incidence of technical progress.

SICK MAN OF ASIA?

India's relative position *vis-à-vis* comparable developing countries has deteriorated over the seventies and eighties. The data from the review presented in the accompanying table are pertinent in this connection.

While the comparisons with China and the NICs are useful, South-east Asia (Indonesia, Malaysia, Philippines, Thailand) appears to have overtaken the NICs, China and India, over the last two or three years, in the rate of growth of exports and of real GDP per head. India's inability to achieve a breakthrough has earned it the notoriety of being described as "the sick man of the region" (*The Economist*, May 5, 1990).

The beginning of the decade of the 1990s does not seem to augur well for Indian economic development. International economic and political developments have marginalised the significance of India and China. In international business and industrial fora, inter trading and inter-investment amongst United Europe of 1992 (to be united further with Eastern European countries by 2000), the North American bloc (USA and Canada and Mexico), linked to other Latin American countries, and the Asia Pacific rim (Japan, the Dragons—Taiwan, Hong Kong, South Korea and Singapore—and South-east Asia—Indonesia, Thailand, Malaysia and the Philippines), are alone increasingly analysed, discussed and built up. China and India have been added to the laggards of Sub-Saharan Africa. China, of course, will always be a natural market and investment outlet for Japan. Sub-Saharan Africa could, hopefully, emulate at least India in agricultural development. This leaves India to muddle through as best as it can, hopefully using the potential of SAARC. On the other hand, this benign neglect may be a welcome development and lead to introspection and internal restructuring.

PERCEPTION: WORLD BANK VS UNIDO

The World Bank group and the United Nations agencies are perhaps an exception in this milieu of emerging neglect of the Indian sub-continent. The World Bank published last year its report on 'Recent Developments and Medium Term Issues in India'.

The perceptions of UNIDO and the World Bank as to the causes and consequences of recent industrial growth are basically similar. While the UNIDO study goes more into branches within the industry sector, the World Bank study relates the industry sector to the other economic and social sectors. The broad conclusions of the two studies are summarised below.

World Bank

In manufacture, a growing awareness has developed that the performance of manufac-

Indian Industry: Stagnation or Growth?

S Nanjundan

India: New Dimensions of Industrial Growth, Industrial Development Review Series, United Nations Industrial Development Organisation (UNIDO), published by Basil Blackwell, Oxford 1990, pp xxiii + 253, \$79.95 (North America), £ 20 (developing countries), £ 50 (other countries).

UNIDO has over the past 10 years or so published 55 country and regional reviews covering more than 85 developing countries as non sales (or free distribution) publications. These reviews have presented an analysis of the country's industrial development, both as a service to those within UNIDO and other international agencies concerned with industrial policy, planning, project development and implementation and as a ready source of information for governments, financial and industrial enterprises, research institutions and other agencies connected with aid. Having gained experience and strengthened its data base and information flow, UNIDO has now launched a new review series of sales publications for a wide range of international readership associated with industry, finance, trade, business, research and governments. India is the first country covered in this series; fourteen other developing countries are to be featured in forthcoming reviews.

The data contained in the review are analysed and interpreted by this reviewer as follows: Growth of India's GDP (annual average 4 per cent to 5 per cent) and of its MVA (annual average 7 per cent to 8 per cent) during the eighties, have been insufficient to reverse the structural retrogression of the preceding decade and a half. The share of industry (manufacturing, construction, electricity, gas and water supply) in GDP was 20.67 per cent in 1970-71 and 21.91 per cent in 1985-86 (at 1970-71 prices). While between 1970 and 1980, gross domestic capital formation (GDCF) and gross domestic savings (GDS) as percentage of

GDP at current market prices increased by 6 per cent, these ratios have remained stagnant over the eighties: GDCF (22.8 per cent in 1980-81 and 22.5 per cent in 1987-88), GDS (21.2 per cent in 1980-81 and 20.2 per cent in 1987-88). As regards the composition of manufacturing value added (MVA), structural changes have been slow or static or even retrogressive. Between 1977 and 1986, the share of food products in MVA increased from 8.3 per cent to 7.9 per cent; of textiles from 20.1 per cent to 15.6 per cent; of iron and steel from 7.4 per cent to 6.2 per cent; of wearing apparel from 7.0 per cent to 5.8 per cent; of footwear from 1.4 per cent to 1.0 per cent; and of transport equipment from 5.9 per cent to 5.6 per cent. The shares of leather products (0.3 per cent), furniture (0.3 per cent to 0.4 per cent), rubber products (1.2 per cent), non ferrous metal (0.7 per cent to 0.8 per cent), fabricated metal products (2.5 per cent) and professional and scientific equipment (0.4 per cent) remained more or less the same. Increases were mainly in industrial chemicals (from 4.5 per cent to 6.1 per cent) and electrical machinery (from 5.0 per cent to 8.6 per cent). Furthermore, the share of value added in gross output decreased from 23.2 per cent in 1975 to 18.6 per cent in 1986, which is indicative of import cost escalation and of increased 'kit culture' or assembling from imported components. Of 28 ISIC categories of manufacturing, 8 showed negative growth of value added per employee during 1975-85. Notable exceptions, as in the case of increase in shares of sub-sectors in MVA—were in industrial chemicals and electrical machinery, where there was a 5.5 per cent increase in

turing between the 60s and the end of the 70s did not generate the growth, employment and foreign exchange that the economy required.

The growth was slow and the combined productivity of capital and labour also rose slowly. The technology used often was outmoded and the goods produced often did not match world market standards of quality and price. India's share of LDC (less developed countries) manufactured exports, once among the highest, fell substantially.

The causes of this less than hoped for performance are generally recognised to lie in lack of internal competition, import competition and export rivalry. The licensing system, reinforced by controls on large firms (MRIP) and preferences for small scale industry and public enterprises, tended to maintain a seller's market and reduced incentives for cost cutting and quality control.

The complicated and case by case nature of licensing and import controls diverted entrepreneurial talent from cost cutting, innovation and quality improvement to dealing with the government. Though many of these problems persist, they have been reduced by recent policy changes.

Over the longer term, attaining at least a 5 per cent per annum growth rate will depend on continued improvements in productivity.

The investment rate will need to be maintained or even increased from the current high level in order to further 'drought proof' agriculture, modernise the capital stock and provide the necessary infrastructure. To finance this investment, India can largely rely on its own high savings rate.

Although India's recent performance deserves some congratulation, there is little room for complacency. Industry has done well but agricultural performance will need to improve.

With reasonable incentives, Indian exports could expand rapidly even in a slowly growing world market, because at the moment India's exports are too small to have much effect on the market.

UNIDO

The 1980s have witnessed a new era of industrial growth. A quantum leap in industrial output has been accompanied by a new accent on modern technology. Although limited structural change has taken place within manufacturing, the base of Indian industry has widened considerably with the public sector playing the pivotal role in the production of coal, steel, machine building, ship building, non ferrous metals, fertilisers, and electronic items apart from power generation. The private sector for its part has revealed its potential for massive investment in response to periodic activation of capital market. Large investments in the automobile, petrochemicals, food processing, engineering and other industries, with foreign participation and an inflow of funds from non resident Indians have continuously accelerated the pace of expansion.

The bright picture of Indian industry, however, is not without its blemishes. The number of large, medium scale and small enterprises that were sick increased from 93,282 in December 1984 to 159,262 in June 1987. Management deficiencies, inaccurate market forecasting, inefficient use of working capital,

labour unrest and cost escalation are cited as key factors affecting industrial performance.

A fall in the share of value added in gross output from 23.2 per cent in 1975 to 18.6 per cent in 1986 is indicative of input cost escalation in industrial production, adversely affecting the price competitiveness of products. Imported inputs are becoming increasingly expensive in the wake of the decrease in value of the Indian rupee against key currencies. In general, there has been a fall in the non wage share of value added, reflecting an increase in wages with no proportionate improvement in productivity.

The new policy of the government attempts to lower the level of protection, with a view to promoting a competitive environment that should reduce industrial concentration and discourage unfair trade practices. Infant firms are expected to become competitive in the domestic and international markets.

With the share of manufactured exports in total exports increasing from 50.3 per cent in 1970-71 to 63.6 per cent in 1987-88, India's export profile has undergone significant changes. Exports of textiles, garments, gems and jewellery, handicrafts, leather goods, engineering, marine and chemical products have risen spectacularly in the 1980s. The fact that Indian firms are capable of supplying complete plants for manufacturing sugar and cement, a significant proportion of machinery for large plants in pulp and paper, boilers for industrial use and power generation, and the technology needed for chemical industries, demonstrates the country's notable achievements in the development of heavy industries.

Apart from the fact that the strong domestic market pull tends to improve the relative profitability of internal sales as compared to exports, a host of other constraints, such as high cost of production, low productivity, substandard quality, inefficient marketing initiatives, etc., inhibit the export drive. The inflow of foreign assistance is yet to produce a favourable balance between imports used and exports achieved. A major cause for concern

is the rapidly rising import bill of foreign firms playing a catalytic role in the development of new industries, modernisation has become highly capital and import intensive.

The response of the Indian industry to the impetus stemming from the liberalisation policy has changed the character of manufacturing activities. However, there has been overcrowding in several areas and some industries are unable to function profitably. The break even points of some new projects have gone up because of heavy initial outlays. In any event, the broad base of the industrial economy can be utilised to greater advantage with proper emphasis on cost effective methods, energy saving devices and constant upgrading of technology.

A faster pace of industrial expansion is within the realm of possibility given a major policy initiative to improve enterprise efficiency levels. Attention should be paid to redeployment of labour and capital from enterprises that are not financially viable to work in the long run. For such a strategy it would be essential to supplement wage and productivity agreements with extensive retraining facilities in order to allow easy movement of the workforce from sick enterprises to more promising ones.

The present liberalisation initiatives are justified in terms of exposing firms to a competitive environment where efficient firms thrive. But industrial concentration should be reduced to help improve the distribution of employment and income. While the extensive subcontracting and ancillarisation programmes have been helpful in fostering medium and small industries, the enterprises concerned have not grown to the stature which they should have attained because of continuing dependence on support from larger firms and failures on the part of the managements of medium and small producers to take advantage of the emerging opportunities in a developing phase. It is thus desirable that the ancillarisation policy should be reoriented with a view to increase its impact on the upgrading of technological and

TABLE INTER-COUNTRY COMPARISON OF SELECTED INDICATORS

| Indicator | Unit | Brazil | China | India | South Korea | Mexico |
|--|-----------------|--------|-------|-------|-------------|--------|
| Population growth (1980-87) | Per cent | 2.2 | 1.2 | 2.1 | 1.4 | 2.2 |

managerial ability of small- and medium-scale enterprises.

The weak correlation between output and employment reflects the increasing capital-intensity of production, implying that improving productive employment opportunities require further upgrading. Apart from a revamping of the national educational system and training facilities, the evolution of a set of monitoring and performance criteria should contribute significantly towards an enhancement of skills.

It is contended that the incentive system for small-scale industries has performed inadequately and would gain from restructuring. The Indian government is conscious of the vital role this segment of Indian industry could play in generating employment, ensuring industrial dispersal and eradicating poverty. The development of achievement-oriented criteria requires an identification of the product groups and locations in which the small-scale industries could function most efficiently.

Since the emphasis will be on improving general standards of living and eradication of poverty, the industries producing essential goods will have to grow significantly. There may be a boom in the industries producing essential goods such as sugar, textiles, processed foods, home appliances, footwear and various other items in daily use. There is a need to double or treble the capacity of these industries in the next decade.

The petrochemical, heavy chemical, automobile, cement, textile, electronics, food processing, leather and engineering industries are expected to grow rapidly in the private sector. In the heavy chemical, automobile and textile industries surplus capacity could be utilised to step up production.

The magnitude of the task facing the private sector in the Eighth Plan will be evident from the fact that the outlay on projects in various industries is expected to be higher by at least 70 per cent. Nearly 50 per cent of this can be met from internally generated resources, including provisions in respect of depreciation charges, and the balance of 50 per cent or Rs 125 billion of the annual outlay will have to be financed from external sources.

A larger inflow of foreign investment could supply the requisite technology and improve the quality of various products.

In considering the prescriptions of UNIDO or the World Bank for rejuvenating industrialisation in India, the specific nature of the malaise in India should be fully taken into account. Liberalisation, foreign investment and more competition may not do the trick in India, in the absence of measures to generate domestic demand. It has been shown in the review (Table II 6, p 28) that domestic demand accounted for 96.4 per cent of growth in manufacturing output during 1963-81. Export-led industrial growth is not a feasible strategy for India. Besides agricultural and rural development, measures to improve the distribution of incomes are necessary to push demand. India's industrialisation has been characterised not only by the lack of export culture, but also by an orientation towards short-term profits, 'kit-culture' and 'make-do' culture, and

an absence of the 'zero-defect' culture and of the urge for technical perfection and quality consciousness. Agricultural and rural development, management training, business ethics orientation, technology and research development, etc, may be more important than direct foreign investment and export promotion. The National Front government's initial enthusiasm for poverty-oriented and rural-oriented development makes more sense than it is generally given credit for.

SOME COMMENTS

A review of the kind prepared by UNIDO with multiple objectives and differing readership is bound to have limitations, especially when it relates to one of the most closed economies in the non-communist world, highly and bureaucratically controlled to the greatest detail in most aspects of industrial development. Firstly, the controlled nature of the economy renders the data and information on policies, plans and targets out of date soon after publication, no matter how much care had been taken by the authors. Much has happened since January 1990 and policies, plans and targets are as yet emerging and frequently changing. This affects the useful investment information given in the Annex, for example, on taxation and fiscal incentives, licensing requirements, and even contact points for investors (since some Indian Investment Centres abroad have recently been closed down). It also affects chapter VI: 'Contours of the Eighth Plan and Sectoral Prospects'. Secondly, arising from the highly controlled nature of the economy, the role of black money, and the parallel economy generated by it, has been growing, some estimates of it amounting to even 50 per cent of GDP. This fact distorts the meaning and significance of official data which relate to the organised sector. In the case of industry, there is a further complication arising from the role of the informal sector for which no reliable data is available.

Despite these limitations the review is fairly objective and takes account, wherever possible, of data on small-scale industry, e.g. cloth production p 54, growth of small scale industry p 34. It is unfortunate, however, that

a number of printing and other errors have crept in; e.g. exchange rate of 12.61 in June 1989 (xiii); population growth 2.1 per cent in Basic Indicators III and 1.8 per cent in Basic Indicators I; value of industrial output of Rs 5.34 billion, instead of Rs 534 billion in Basic Indicators II; first line of Table II.3, p 21, figures for total manufacturing have shifted to left.

The analysis in the text of the review has not been related to the technical co-operation projects of UNIDO. The latter are listed in Annex XIII. In the case of steel the pioneering role of UNIDO in initiating the production of sponge iron is mentioned (p 61). There is no mention, however, of the effect of the UNIDO project for enhancing productivity in the cement industry on this subsector (p 101). The discussion on the ancillary base of the automobile industry (p 73) could have been related to its declining role in engineering exports (p 80).

In this reviewer's opinion, the country focus of UNIDO and the need to prepare such country reviews is a moot question, deserving serious consideration. While the World Bank/IMF and the United Nations Development Programme (UNDP) have necessarily to have a country focus (since they deal with all sectors and provide or earmark resources on a country basis), UNIDO being a sectoral organisation should be concerned with the sector and its branches and subsectors, and develop expertise on policies, technology, processes, structural and productivity questions, efficiency criteria and methods and industrial management. Inter-country and branch studies on these aspects rather than country studies *per se* would appear to be more useful. Without detracting from the usefulness of the study under review it is the view of this reviewer that UNIDO's limited resources could be more optimally utilised through inter-country sector and sub-sector studies, including policy and evaluation studies related thereto, rather than by carrying out country studies *per se*. It goes without saying, however, that some studies of country industrial development potential may well be undertaken at the request of governments as part of the technical co-operation programme.

Money and Monetary Policy in LDCs in the 1990s

Warren Coats
Deena Khatkhate

In this article an attempt is made to expand on and update the authors' earlier review of key issues concerning money's role in economic development by treating more extensively topics touched on in the original article that, with the benefit of hindsight, deserved much fuller discussion and by adding several topics that intervening developments and experience have brought to the fore. In the former category, this paper discusses:

- (a) the information gathering and processing, and risk assessment and management aspects of the financial system;*
- (b) the insights of public choice theory into the difficulties of actually obtaining welfare enhancing policies from highly centralised economic systems and the related problems of rent-seeking behaviour associated with several types of government intervention in economic activities; and*
- (c) the implications of openness and capital mobility for monetary and interest rate policies*

In the category of new issues, this paper discusses:

- (a) increased interest in 'buffer stock' models of the demand for money,*
- (b) the renewed debate over the most appropriate monetary anchor, and*
- (c) the problems associated with the liberalisation of repressed financial systems*

TWELVE years ago the key issues concerning money's role in economic development were summarised in an introductory chapter to a collection of articles on that topic.¹ The central theme was that a country's monetary policy and its monetary system are very important to the pace and nature of its economic development. At that time there was a newly developing consensus that inflation is primarily a monetary phenomenon, and that inflation and macroeconomic instability are generally harmful to growth. Of particular relevance for LDCs it was argued, is the role played by money (and the financial system) in allocating saving to its most productive uses. It argued that low or negative real rates of interest and directed credit policies both interfered with the functioning of the financial system and thus with the efficient allocation of saving.

These views have now become the conventional wisdom of the 1990s. However the focus of the debate has changed in several respects over the intervening decade in response to new objectives, institutional and political developments, new analytical insights and further experiences across countries at different stages of development.

In this article, an attempt is made to expand on and update the earlier review by treating more extensively topics touched on in the original article that, with the benefit of hindsight, deserved much fuller discussion and by adding several topics that intervening developments and experience have brought to the fore. In the former category, this paper discusses

- (a) the information gathering and processing, and risk assessment and management aspects of the financial system
- (b) the insights of public choice theory into the difficulties of actually obtaining

welfare enhancing policies from highly centralised economic systems and the related problem of rent seeking behaviour associated with several types of government intervention into economic activities and

- (c) the implications of openness and capital mobility for monetary and interest rate policies

In the category of new issues, this paper discusses

- (a) increased interest in 'buffer stock' models of the demand for money,
- (b) the renewed debate over the most appropriate monetary anchor, and
- (c) the problems associated with the liberalisation of repressed financial systems

I

Role of Financial Sector

The earlier review stressed the importance of macroeconomic stability because it was needed for money to perform its vital role as a unit of account and a means of payment. It also stressed the importance of positive real rates of interest on financial assets (e.g. deposits) because they encouraged a larger share of saving to flow to investments via the financial system. Macroeconomic stability and positive real rates of interest contribute to the financial system's ability to allocate saving to the most productive investments at the lowest possible cost, thereby raising the level of income and its rate of growth associated with a given rate of saving. The efficiency of investment generally has been more important for a country's economic growth than has been its rate of saving (or investment). However, macroeconomic stability and positive real

rates of interest probably raise the rate of saving as well.

The above explanation of the financial system's contribution to growth, though correct, now seems to be overly simplified and unlikely to convey the full extent of the financial sector's role. The extent of economic specialisation, the foundation of economic development, is limited both by the (information and transaction) costs of trading and by the limited availability of investment financing. An efficient financial system reduces the information and transaction costs of trading and extends the availability of finance and lowers its cost. Market allocation of resources, including savings, has almost always been more efficient than government allocation. This reflects more than the differences in incentives facing decision-makers in private enterprises and government bureaucracies discussed in the next section. It also reflects the inability of centralised decision making to effectively utilise the complex mass of information on individual preferences and capabilities that can only be known in small part by any individual. The decentralised decision-making of market economies has evolved so as to better capture and utilise such information [Hayek (1945) and (1988)].

More indirect, impersonal, and complex economic arrangements and relationships are more risky, however. An agreement to repay in the future is more difficult to enforce than is an agreement to exchange assets now. The expertise and the contractual forms and arrangements that develop in the financial sector (e.g. the nature of specific financial instruments) are meant to reduce costs and to evaluate, allocate, monitor and minimise risk.² In addition to providing an efficient pricing and payments mechanism,

one of the most important contributions banks make to economic growth is to develop expertise in assessing creditworthiness. By collecting and analysing the information needed to determine the most profitable loans, including the prospects for repayment, and by monitoring the activities of borrowers, financial intermediaries increase the efficiency of resource use. In addition, access to a variety of financial instruments enable economic agents to pool price and exchange risk.

When bank credit is allocated at below market clearing interest rates, the allocative and risk management expertise of banks are replaced by political and bureaucratic mechanisms. Over time, the development of project and risk assessment expertise and mechanisms by lending institutions are discouraged, the lack of which can be a serious problem for financially repressed economies attempting to liberalise. In addition to lowering the productivity of investment, these policies have generally weakened the financial viability of the affected financial institutions to the extent that a staggeringly large number of them are now insolvent. The combination of these effects is a huge amount of economic waste.

II

Lessons of Public Choice Theory

The below market clearing interest rates and a somewhat directed credit policy discussed in the earlier review and common in many LDCs interfere with the financial sector's ability to allocate its most productive resources in the best way. The adverse consequence of the rent seeking opportunities created by below market interest rates is only limited in the free sector. Directed credit policies like other non-market allocation mechanisms create opportunities for personal gain that do not contribute to the overall productivity of the economy. The behaviour tends to be directed towards the free sector. Directed credit policies like other non-market allocation mechanisms create opportunities for personal gain that do not contribute to the overall productivity of the economy. The labour resource expended might have been more productive in other uses. The extraction in some areas of rent seeking and the corruption it sometimes encourages might contribute to the allocation of corruption in other areas and to a general decline in public trust in government.

Rent seeking opportunities also create constraints on both within and outside of government to limit their elimination. The interests of these beneficiaries of the present arrangements are often more direct, focused and intense than those of the general public that would benefit from reform. This fact can make the adoption and execution of reform difficult. It is just as true that a government be within inability to reform itself. The most unique and dramatic example of the difficulties of reform are currently in progress in the Soviet Union in Eastern Europe. Soviet president Gorbachev has demonstrated a strong skill at developing, encouraging and then managing internal political competition between ideological

and interest groups as the engine to force reform of the Soviet system.

The refinement and clarification of economic theory and especially the accumulation of evidence from years of experience with various policy approaches, have been essential and often decisive factors behind political support for economic reform. They provide the understanding of the consequence of policy from which a consensus can be formed on what is in the general public interest. Such consensus can then be used to oppose the often better placed special interests that are protecting the *status quo*. The recently expressed desires of the majority of the citizens of centrally planned economies to convert their economies to market based systems has a great deal to do with the failure of the centrally planned economies to deliver what was expected of them even after a long period of time and the current intellectual consensus on the superiority of market over centrally planned systems. One of the many dangers of partial reform is that the remaining rent seeking opportunities continue to support and encourage the special interests that benefit from them which then tend to resist or even reverse further reform.

III

Increased Economic and Financial Integration

As noted in the intellectual and political factors discussed above, growing economic and financial integration has been an increasingly important force behind economic and financial liberalisation over the last few decades. Technological advances in information processing and dissemination (computers and telecommunications) increased freedom of trade and financial liberalisation in the industrial countries have made policies that in autarky virtually impossible. Efforts to maintain and fortify the insulation required to enforce non-competitive prices, such as below market interest rates, have become increasingly hard to implement and to justify.

The increased worldwide integration of markets has improved resource allocation and economic efficiency but as indicated above has limited the policy options available to authorities in both developed and developing countries. The significant increase in international capital mobility, for example, has reduced the ability of national authorities to conduct domestic monetary and fiscal policies independently of external considerations even with flexible exchange rates. The increased ease with which capital flows internationally means that it is even more difficult and costly than before to exert direct control of interest rates and the allocation of credit even in the absence of capital flight to external markets. Added to the existing domestic (or external financial markets on lending and corruption) tending to undercut

such policies. These developments suggest that domestic interest rates now need to conform more closely than before to international levels. It is worth reviewing here the implications of capital mobility for domestic monetary and fiscal policies under both fixed and floating exchange rates.

Perfectly mobile capital renders the domestic money supply endogenous in nominal as well as real terms for (relatively small) countries that fix the exchange rates of their currencies in terms of some other currency. The fixed exchange rate makes the domestic price level exogenous, while freely mobile capital makes the domestic interest rate exogenous. This makes it impossible for the monetary authorities to change permanently the domestic money supply from the nominal quantity the public wishes to hold at the exogenously determined price level and interest rate.⁶

Given output growth, an increase in the quantity of money will depress domestic interest rates, leading to a capital outflow. If capital is perfectly mobile, no interest rate differential can persist across national boundaries and the capital outflow will continue until the initial interest differential is eliminated, i.e. until the domestic increase in the money supply is exactly reversed.

Allowing exchange rates to float restores to the central bank the ability to control the domestic nominal money supply, because the domestic price level becomes independent of the world price level. With highly mobile capital, however, floating exchange rates cannot restore domestic policy independence from the foreign sector because domestic policies that create a demand by foreigners for domestic assets (or vice versa) affect exchange rates, which affect the allocation of domestic resources.

Perfect capital mobility ties the level of domestic real interest rates to that of the world. Temporary differences in the level of domestic and international interest rates, such as might result from an unexpected change in the domestic money supply, cause exchange rate changes that lead to real resource transfers which in turn will eventually eliminate any real interest rate differential. The exchange rate changes imply changes in the relative prices of tradable and non-tradable goods which helps establish (or preserve) external and overall balance but can also cause a reallocation of resources between these sectors.

The mechanism by which capital mobility links interest rates and exchange rates may be summarised as follows. Capital flows internationally to the extent that savings are invested across national boundaries as a result of current account deficits or surpluses, i.e. to the extent there are net transfers of real resources across national borders. With freely floating exchange rates, the inducement for capital to flow internationally as a result of a change in relative interest rates is offset by exchange rate movements, capital flows will accrue only after exchange rate changes have brought

about current account adjustments.

An increase in the domestic money supply that reduces domestic interest rates relative to foreign rates, for example, would raise the premia in the forward exchange market of the domestic currency in terms of other currencies sufficiently to eliminate any financial gain from investing in foreign assets with higher interest rates. As a result of this increase in forward premia, the spot purchase and investment of foreign exchange, and the forward repurchase of the domestic currency would result in the same yield as would investing in domestic assets at the lower interest rate. However, investors prepared to take the risk could buy the foreign exchange spot and hold foreign assets uncovered by future commitments to reacquire the domestic currency, if they believed that the forward premia overstated the likely appreciation in the future spot exchange rates of the domestic currency. If this were the market's general view, speculation would immediately lower the spot exchange rate until it was expected to appreciate to the same extent as implied by the forward premia.⁸

Through these channels, market forces would tend to eliminate any net advantage from shifting financial assets across national borders, so that the public would be satisfied holding the existing stock of assets at the new interest rates. The depreciation of the spot exchange rate in the low interest rate country, however, would result over time in the current account surplus needed to realise the desired net capital outflow.

It can be seen in this simplified account that while floating exchange rates with capital mobility allow divergent inflation rates and nominal interest rates and therefore domestic control of the nominal money stock by the central bank, they do not isolate the domestic economy from the world economy, nor allow domestic monetary policy to operate without regard for the foreign sector. The freer capital is to respond to interest rate differences, the more efficient long-run resource allocation will tend to be, but the larger will be the exchange rate effects (and hence real economy effects) of such differentials. If these interest differentials and exchange rate effects are in fact temporary, but are not correctly perceived as such by market participants, they could impede the efficient allocation of resources by causing unnecessary and costly short-term reallocations between tradable and non-tradable goods sectors.

The resource reallocations resulting from exchange rate changes are costly, often involving a temporary increase in unemployment, idling of capital equipment, and heightened political strains that are associated with any redistribution of costs and benefits in a society. Moreover, frequent changes in exchange rates can cloud resource allocation decisions and lead to reallocations that prove to be mistaken; exchange rate movements that are expected to be temporary can lead to political support for protection in the form of trade and capital con-

trols. These costs of resource reallocation in response to exchange rate changes are the basis of the often expressed desire for exchange rate stability, and are simply a specific example of the general case against macroeconomic instability.

Artificially low real interest rates require capital controls to restrain the capital flight (in search of higher yielding and/or less risky investments) that normally accompany them. While capital mobility is not perfect in developing countries, the authorities' ability to control capital movements is increasingly limited by the proliferation of financial instruments internationally and the ease with which they can be obtained or traded. This, and an increased understanding of the shortcomings of 'low interest rate' policies and of the repressed financial sectors that result from the more extreme versions of such policies, have diminished the interest of authorities in adhering to them.

Fortunately, the policies needed to avoid capital flight, e.g. realistic exchange rates, acceptable fiscal deficits, attractive domestic financial assets, a healthy, competitive financial sector - and economic and political stability are the same policies that are needed for efficient resource allocation in general. Authorities wishing to liberalise their domestic economy's financial sector and the international movement of capital, should liberalise their domestic financial sector first in order to minimise the prospects of capital flights [Edwards (1984)].

IV

Estimating Demand for Money

A major theme of the earlier review was the recent move away from many of the conclusions of earlier short-run focused Keynesian models. The attack on Keynesian theory by Milton Friedman and others in the 1960s was further refined in the 1970s, primarily by efforts to incorporate behavioural assumptions into macroeconomic models consistent with those used elsewhere in economics (microeconomic foundations). Studies of earlier hyper-inflations, as well as an increasing number of contemporary ones in Latin America and elsewhere, supported monetarist models and revealed that Keynesian theory had little of interest to say about inflation. A growing understanding of the role of expectations in macroeconomic models advanced by Friedman (1968) and Ed Phelps (1967 and 1970) helped explain (in fact they predicted) the empirical failure of the alleged trade-off in industrial economies between inflation and unemployment (the 'Phillips Curve').

Major theoretical developments during this period resulted from refinements of the implications of forming expectations of the future values of important economic magnitudes in ways consistent with the information available to agents and their understanding of how the economy works (rational expectations). In some respects, however, the important insights and theoret-

ical refinements derived from the assumption that agents form expectations rationally have gone too far, especially, but not exclusively, in the underdeveloped economy context. While present treatments of rational expectations focus attention on the importance of information, they tend to abstract from the costs of obtaining it. In fact, the key functions of money (and of financial systems) of reducing the costs of transacting (including those of obtaining information on market opportunities) tend to be overlooked or down-played by current treatments of rational expectations [Laidler (1990)].

The 'buffer stock' view of money and its implications for empirical estimates of the short-run demand for money [Coats (1982a) and Laidler (1990)] attempt to correct the tendency of rational aspects models to ignore the role of money in reducing transaction costs. It has particular relevance to underdeveloped economies where market integration is incomplete, financial assets other than money are rather limited, and transaction costs are relatively high. The approach says that changes in the quantity of money (that are not themselves induced by changes in money demand) will to some extent be willingly absorbed into money holdings, which serve as a buffer stock to reduce the cost of transacting, including the costs of adjusting to changed circumstances. If the increased money stock proves permanent, then money demand will ultimately adjust fully.

In most models, money demand adjusts via changes in income, interest rates and the price level. The long-run independence of income and (real) interest rates from the quantity of money implies, however, that a permanent change in the quantity of money ultimately is fully reflected in adjustments in the price level. The long-run properties of buffer stock models are no different than those of traditional money demand models, but in the short-run they imply smaller adjustments of interest rates (and income) to changes in the money stock [Coats (1982a)]. As noted above, this result assumes that the change in the quantity of money was independent of the demand for it.

The money supply is 'independent' of its demand as a result of the relationship between the extension of credit and the creation of money by the banking system. An increase in bank reserves (e.g. as a result of a foreign capital inflow or of central bank financing of the government) leads banks to increase their lending (or purchases of financial assets). Lending rates may need to be adjusted to encourage the public to borrow what banks wish to lend. Additional deposits (money) are created as a by-product of bank lending. The interest rates that clear the credit market will not generally also clear the money market in the long run, i.e. the increase in the money supply that results from the increases in bank loans, and the associated interest rate, will not generally be the same as the increase in long-run money demand from that interest rate. The buffer

stock approach reconciles the discrepancy in money and credit demand in the short run and assigns the determination of the interest rate primarily to credit markets. Some of the apparent shifts in money demand over the last two decades found in conventionally estimated money demand functions for the US have been explained by the buffer stock approach.

Monetary Anchors

The establishment of price stability has become an unquestioned objective of macro-economic policy virtually everywhere. This is in sharp contrast to the views held by many economists and policy makers in earlier decades and is welcome. There remains considerable uncertainty, however, over how best to achieve and preserve price stability.

At the time the first review was written, the use of money growth rate rules or targets to anchor the price level had not yet come into vogue. Money growth rules of one sort or another were embraced in the very early 1980s by many industrial countries for several compelling reasons:

- (a) the link between inflation and money growth (the long run stability of the demand for money) had been empirically established beyond a reasonable doubt for a wide range of developed and developing countries;
- (b) the short run variability of money demand made the outcome of monetary fine tuning unreliable;
- (c) the experience of the 1960s and 70s suggested that discretionary monetary policy tended to have a rather strong inflationary bias for 'public choice' reasons, which could be avoided by replacing discretion with rules (the time inconsistency problem);⁷ and
- (d) the adoption of monetary rules meant the abandonment of exchange rate rules or targets and the grudging acceptance of floating exchange rates was relatively widespread by the early 1980s.

Several things have led to the more recent abandonment of monetary rules in many countries and the search for alternatives monetary anchors. One is that the demand for money proved less stable than some had expected. Monetarists such as Friedman, had always focused on the long-run stability of the demand for money and had warned that the unusually close relationship between money and the arguments in its demand function during the 1960s and early 70s was fortuitous and not likely to last. Contrary to the impression given by some critics, the long-run stability of money's demand has remained pretty much intact though some predictable drifts has occurred in response to the very dramatic growth in the range and nature of financial instruments that resulted from technical advances in information processing and dissemination and from regulatory liberalisation. Unpredictable short-

run variations in the demand for money, however, can be relatively large and troublesome for overly rigid monetary rules.

There is a special problem in adhering to monetary growth rules in developing countries, reflected in the use of government deficit limits as performance criteria in adjustment programmes financed by the IMF. In LDCs, which typically lack well developed financial markets, governments are limited to borrowing from their central banks to finance their deficits. In this context monetary policy and fiscal policy merge. Monetary growth rates cannot be kept to non inflationary rates unless the government's borrowing requirements are kept to low levels.

The short run instability in the demand for money, combined with a growing disillusionment with floating exchange rates, has increased interest in a fixed exchange rate as the monetary anchor. The phenomena of exchange rate overshooting described above in Section III explains why real effective exchange rates have been more volatile than was originally expected. Fixed rates are probably more conducive to freer trade, more rapid growth and greater efficiency in world wide resource allocation than are floating rates. The rub, of course, is that fixed exchange rates require subordinating domestic monetary and fiscal policy to external balance and most countries simply are unwilling or unable to do so. Under these conditions floating exchange rates are clearly preferable to fixed ones.

For countries prepared to play by the rules of a fixed exchange rate regime (sometimes called the gold standard rules), however, the fixed rate becomes the monetary anchor of the system. A country's money supply must be allowed to match whatever amount is demanded at the price level implied and imposed by the value of whatever the domestic currency has been fixed to. This makes any instability in the demand for money irrelevant. It is no longer necessary even to estimate it. Simply supplying or redeeming domestic money for foreign currency at rates implied by their values in terms of the one to which the domestic currency is fixed will insure that the economy has whatever amount of money it wants at that rate.

Another reason for interest in fixed exchange rates as monetary anchors is the potential for a fixed rate monetary system to give quick credibility to anti inflationary efforts. Renewed interest has arisen from the efforts of the centrally planned economies of Eastern Europe and the USSR to establish market based economies and monetary systems that integrate their economies more closely with existing market economies and to establish the convertibility of their currencies needed to support that integration. Similar interest arises from countries attempting to re establish macroeconomic and price stability after periods of high inflation.

Reducing monetary growth to rates consistent with stable prices causes very high real rates of interest and contraction of real out-

put until the public is convinced that prices are and will remain stable. The ability to reduce inflationary expectations quickly depends on the credibility of a non-inflationary monetary (and fiscal) policy. It has been argued that a publicly announced monetary growth rule with a consistent fiscal policy would help establish credibility and reduce the expected rate of inflation more quickly than waiting for the development of a non inflationary track record, which might take many years. Experience in this regard has been disappointing. The monetary rule embodied in a fixed exchange rate (or redeemability in terms of a commodity basket) with full convertibility supported by an adequate stock of reserves (or whatever the redemption asset might be) and a consistent fiscal policy, potentially could establish credibility more quickly. If the policies and the commitment to the policies are credible, the prices of tradable goods will be known to be stable from the very first instance because they can always be imported at a relatively stable price in terms of the local currency. The use of fixed exchange rates in this way has been an important feature of most stabilisation programmes in Eastern Europe.

The choice of the currency to which the domestic money is fixed determines the behaviour of the domestic price level measured in terms of the domestic currencies. Countries generally fix their currency's to others that have low inflation rates and thereby 'import' relative price stability. A system of fixed exchange rates relies on the good behaviour of the central bank that issues the currency the country's money is fixed to. The US dollar and the German mark have frequently been selected for this purpose because of the track records of the Federal Reserve and the Bundesbank in keeping inflation of their currencies low. Those records, however, have been far from perfect and the question has been raised whether countries couldn't do better.

Recent proposals to achieve zero inflation rates by fixing the value of money to a basket of commodities rather than to another currency answer the above question in the affirmative (Lats (1989)). In its broadest outlines such a system would work like a traditional fixed exchange rate system or the gold standard. Domestic money must be supplied and redeemed on demand at its fixed value in terms of an independently defined unit of account (an amount of foreign currency, a quantity of gold, a basket of commodities, etc.). The system would differ from these earlier systems in two important respects. While having a gold standard's advantage of protecting the value of the unit of account (and hence of the medium of exchange via the redeemability requirement) from political influences, the proposed system would not impose the relative price changes of a single commodity such as gold or silver on the price level. By defining the system's unit of account as a basket of goods, the quantities of which could be ad-

justification for the power against the broadest possible price index as suggested by Irving Fisher at the turn of the century [Fisher (1913)], the unit of account would have an almost constant real value day-to-day as well as in the long run. The other major difference with earlier monetary systems based on commodity standards is that money would not be redeemed directly for its unit of account. It would be redeemable indirectly for the commodity basket; i.e., it would be redeemable for something (a commodity or financial instrument) equal in current market value to the basket. Indirect redeemability eliminates the need to hold expensive and cumbersome inventories of all of the items in the valuation basket.

This 'new' technique of indirect redeemability has actually been in use for many years. Two examples, should suffice. If Austria's shilling is fixed in price to the German mark (DM), it is still possible and in fact common, to exchange (redeem) shilling for US dollars (or some other currency). The amount of dollars received per shilling will have the same market value as the fixed amount of DM to which shilling holders are entitled, i.e., the amount of dollars received will just enable the redeemer of shilling to buy in the market the amount of DM implied by the fixed shilling price of DM. As indicated, this example of indirect redeemability has been practised for centuries. A more recent example is provided by the SDR and the ECU, the assets of the IMF and the EC valued on the basis of currency baskets. While exchanges (redemptions) of SDRs or ECUs may be, and sometimes are, made for the appropriate amounts of all of the currencies in their valuation baskets, they are more often exchanged for an amount of a single currency that will just buy in the market the appropriate number of units of the entire basket.

An important challenge for any monetary system is to strengthen the incentives for, or constraints on, the system to adhere to the rules of the system adopted [Coats (1989)]. The failure to do so in the past has led to painful devaluations, and the abandonment of fixed exchange rates (even, eventually, to the abandonment of the gold standard). No system is insured to this risk, but systems based on an independently defined unit of account, because they are more transparent and less subject to manipulation, are likely to be more resistant to violations of their rules than others.

VI

Phasing of Financial Liberalisation

The truly newest topic since the original review was written concerns how to get from a repressed to a basically free market economy with the least damage and with political support intact. The totally unforeseen and considerably more difficult task of

creating market economies out of centrally controlled ones is an extreme version of this topic. This is a vast and complex topic about which there is much yet to learn. In this update of the original review of monetary policy in developing countries, the reasons for and objectives of financial sector reform and the lessons for designing successful reforms gleaned from the experiences of countries that have attempted them are revisited.

It has been common for developing countries, especially those that rely heavily on central economic planning, to tap their financial systems' resources and to direct them in accordance with their development plans. Controlled interest rates and government directed credit allocation are among the commonly used tools of central planners. Such policies have stunted the development of financial systems and invariably reduced the efficiency with which saving has been invested (to mention but one of the functions of financial institutions). The growing recognition that economic development requires greater scope for market allocation has its counterpart in the financial sector as well.

The superiority of market allocation of saving, which is the heart and soul of the financial system, and the basis for the financial sector's importance for economic development, is now well established. Many countries now recognise that their intervention in credit allocation has had an unfavourable impact on both financial and industrial development. The evidence from country experience also suggests that directed credit programmes have not been efficient tools for income redistribution or for overcoming imperfections in the real goods markets.

These lessons have prompted an increasing number of countries to liberalise their financial systems. The experiences of these countries vary. The liberalisation of financial systems in some countries led to financial collapse and the return to controls. In some others it succeeded, though in varying degrees, in improving the quality and lowering the cost of financial services and in raising growth rates. Some preliminary lessons can be gleaned from recent experiences.

Financial reforms generally include, *inter alia*, the freeing of interest rates; elimination of directed credit allocations; removal of barriers to entry into the market of new, or departure of existing, financial institutions; elimination of restrictions on the activities into which any given institution may enter; the removal of discriminatory taxes on financial transactions; the improvement of information available to borrowers and lenders in the making of their financial decisions, and the assurance of a supportive legal, regulatory and administrative structure, including the improvement of the prudential regulation and supervision of financial institutions, an adequate bankruptcy law and the effective and efficient enforcement of debt contracts.

One of the most important lessons to be learned far enough in implementing the above policies is the continuation and further entrenchment of weak and/or inefficient financial institutions, the continued misuse of resources, and slower growth and lower living standards than necessary. The cost of moving too quickly could be politically unsustainable levels of unemployment and loss of income resulting in the failure to achieve lasting reform and regression back to moré controls. In short, the manner and pace of reform seems critical for its ultimate success. The lessons of experience with financial liberalisation are tentative—some lessons are clearer than others.¹⁰

(1) MACROECONOMIC ENVIRONMENT

The first and strongest lesson is that financial liberalisation is very difficult, and unlikely to succeed, without a considerable degree of macroeconomic stability. The rocky liberalisations in Argentina, Brazil, Colombia, Mexico, and Uruguay and the temporarily derailed liberalisation in Chile in the mid-1970s through early 1980s were undertaken in the midst of serious inflation (generally 100 per cent per annum or more reflecting their governments' need to finance expenditures by borrowing from their central banks. Large government deficits, and rapid inflation invariably were accompanied by resource wasting, over-valued exchange rates.

Inflation has a number of pernicious effects. The informational content of prices is reduced so that the economy becomes less efficient. Investments, in fact long-term commitments of all types, become more risky and are therefore reduced. Additional resources are absorbed by efforts to overcome or adjust to the distorting effects of inflation. The real returns on financial assets are reduced and the profitability of financial institutions weakened. Both of these effects reduce the financialisation of saving which further reduces economic efficiency and growth.

Financial reform itself involves changes in relative prices that need to be assessed and absorbed by economic agents. When they take place in an environment of general price instability it is much more difficult to determine appropriate interest rates and to interpret those that result. Experience suggests that without macroeconomic stability it is very difficult to achieve the level of interest rates that are well aligned with the real sector's productivity, whether interest rates are market determined or regulated. Successful financial liberalisations either began in an environment of relative macroeconomic stability or addressed macro instability first. In addition, the continued health and viability of a liberalised financial sector requires the continued maintenance of a reasonable degree of macroeconomic stability.

A related lesson, seen repeatedly all over Latin America, is that once monetary virtue is lost, it cannot be regained easily or

without significant cost. The opiate of inflation, so seductive and pleasant in the beginning, loses its kick through time, requiring larger and larger doses just to continue its pleasurable stimulation. An addicted economy cannot function efficiently, but it cannot withdraw from its addiction without considerable pain. The failure to restrain government expenditures within the limits that can be financed without inflationary monetary growth, therefore, begins a very dangerous process. By reducing the attractiveness of financial assets, inflation reduces the tax base, particularly the base relevant for the inflation tax, and hence reduces government revenue, which, in the absence of improved fiscal discipline, further increases the need to borrow from the central bank. This increases inflation further and further until fiscal discipline is rediscovered (or there is monetary collapse) at which point a terrible price is paid to re-establish price stability.

A government's rediscovered commitment to price stability is not quickly believed, hence inflationary expectations are slow to adjust—once lost, government's credibility is hard to re-establish. As a result, real interest rates rise to high levels, and aggregate demand falls more rapidly than prices, temporarily increasing unemployment. Investment and growth are therefore low to recover after a period of inflation.

(2) INSOLVENT INSTITUTIONS

The second lesson is that liberalising insolvent financial institutions will not generally make them healthy again. Many financial institutions in developing countries are insolvent. Financial liberalisation generally reduces the earnings of financial institutions during the adjustment period. Until a restructured, healthier system establishes itself, financial liberalisation causes considerable strain for many banks and other financial institutions. To withstand these strains they need to be viable to begin with.

Insolvent institutions generally do not allocate resources in an efficient manner as the objective of their lending is to minimise or cover over their own portfolio losses in the hopes that they can recoup them in the future. Experience shows that insolvent institutions generally continue to make losses and therefore continue to waste valuable resources. They should be closed or restructured at the very beginning of any reform and steps taken to reduce the prospects that the practices that lead to insolvency will re-emerge in the future. These steps include the elimination of excessive priority lending, unrealistic interest rate ceilings on loans, and excessive directed credit, and the establishment of adequate prudential regulation. Because insolvent financial institutions are often the victims of the arrears of insolvent borrowers, closing or restructuring the offending firms (often state owned enterprises) will also be necessary.

(3) REAL SECTOR ENVIRONMENT

This leads to the third lesson, which is that increased market allocation of credit will not generally improve the allocation of resources in countries with a distorted price structure. In fact, market allocation of credit under these circumstances may increase misallocation by allowing finance to respond to incorrect price signals. For example, the overvalued exchange rate in Chile in the early 1980s continued to favour the non-tradable sector, leading among other things to excessive real estate development. By postponing the adjustment of relative prices between tradable and non-tradable goods the ultimate adjustment was made larger and more disruptive. In the subsequent crisis, real estate was one of the sectors hit the hardest. This, in turn, contributed to widespread defaults on bank loans and the collapse of the banking system. Trade and other real sector liberalisation should proceed or at least coincide with financial sector liberalisation.

Liberalisation of the real sector, however, creates additional stresses in the financial sector. Structural adjustment is meant to cause a reallocation of resources from the protected but less productive firms and activities to more productive uses and this often bankrupts or impairs the viability of these firms. Stress in the real sector can hardly avoid reflecting itself in the financial sector from which it has borrowed. Those countries that liberalised their financial systems during periods of rapid relative price changes, such as generally occur during stabilisation and structural adjustments, experienced actual (*ex post*) real interest rates often considerably in excess of the return to investment. Such excessively high real rates are symptomatic of distress borrowing.

Full liberalisation of bank interest rates and lending policies encounters two problems in this environment. One is that the bank management skills necessary to assess credit risks and properly control bank exposure in the new liberal environment generally takes time to develop. This exposes banks to unfamiliar and difficult to assess risks if their activities are not limited. The other is that those banks that do encounter difficulties may be tempted to continue lending to bankrupt or overly risky customers in order to maintain the appearance that outstanding loans to distressed firms are still viable. For a bank that has already lost its capital, gambling on risky long shots (betting the bank) is the only hope left to it. In the environment of significant corporate distress encountered in Argentina, Chile, the Philippines, Turkey and Uruguay, real interest rates were raised to unsustainable levels, which distressed firms willingly paid in order to avoid admitting insolvency in the hope that things would improve in the future.

Thus major structural reforms should be completed prior to complete financial liberalisation. Inefficient public enterprises and

highly protected domestic firms that would not be viable without public subsidy and trade protection should be restructured before financial liberalisation. In these early phases of reform, interest rates should be set at modestly positive real rates (reflecting the rate of return on capital), but should not be left fully to the market.

(4) PRUDENTIAL REGULATION

A fourth lesson is that when financial institutions are free to set interest rates and enter new lines of business, it becomes more important for investors, be they stockholders or depositors, to have accurate information on the condition and activities of these institutions. It may also be necessary to impose some prudential limits on their lending. In their effort to free the financial system of repressive economic regulation (and taxation) some governments failed to provide adequate prudential regulation (e.g., market value accounting, reporting, and capital standards, and lending and portfolio concentration limits) and were unprepared or unequipped to properly monitor bank behaviour on behalf of depositors. The liberalisation of the banking system in the absence of effective prudential regulation and supervision allowed banks to engage in imprudent lending and fraud, and led to widespread financial distress in the Southern cone. Privatisation of banks in the Southern cone without establishing adequate prudential regulatory framework also led to the heavy concentration of bank loans to their affiliated firms when they became part of industrial groups after privatisation.

(5) PACE OF REFORMS

A final lesson concerns the pace of reform. Although there are exceptions (e.g., New Zealand), most successful liberalisations were implemented gradually. Since financial reforms change the rules of the game, rapid implementation may impose losses on otherwise viable firms that entered into contracts and arrangements under the old rules with the expectation of their continuance. As already noted, a gradual liberalisation also allows time for financial institutions to develop the skills needed and to adapt to the new competitive environment. Undue delay, on the other hand, incurs the cost of perpetuating the inefficiencies of the repressed system. And the longer the period of government control, the more serious the shortcomings become. The lesson is that the authorities must anticipate how reforms and the consequent changes in relative prices will affect different groups. Both from the standpoint of equity and making change politically acceptable, it may be necessary to provide some form of transitional compensation to those most adversely affected while maintaining the incentive effects of the reforms. The appropriate balance among these considerations will depend on the initial degree of repression and other aspects of the economic environment already discussed.

The issue of the appropriate pace of reform has arisen again in the context of the conversion of centralised or command economies to market economies. The reform under way in Eastern Europe and potentially in the Soviet Union have no historical counterparts from which to learn. It is clear that the expertise and infrastructure of capitalism will take many years to develop. However, the macroeconomic, legal and regulatory environment in which private enterprises are established and developed, could and probably should be reformed as quickly as possible.

(6) TRANSITIONAL CONTROLS

As discussed above, complete liberalisation may not lead to equilibrium interest rates in countries with serious macroeconomic instability or in countries without adequate competition in financial markets. In countries in which these conditions have not been established, the government may need to manage interest rates to avoid serious misalignment and greater distortion in resource allocation. In those cases, the government should adjust the level of interest rates to reflect changes in inflation, cost of funds, and exchange rate movements. Countries with open economies need to pay close attention to the level of domestic rates as compared to international rates adjusted for expected exchange rate changes. Preferential interest rates should be phased out and the structure of interest rates should be set to allow different margins for loans of different maturity, risk, and administrative costs.

When substantial progress has been made in reforming industry and the financial system and when the economy is stable, the government can move toward more complete liberalisation of interest rates. Some countries have first set ranges on deposit and lending rates allowing banks to set specific rates within the ranges. The ranges were widened and ultimately removed as liberalisation progressed. Unfortunately, very few countries have succeeded in controlling interest rates in the manner prescribed above. Successful examples are Korea, Japan and Taiwan.

VII

Conclusion

Over the period since the original review was written, a consensus has developed that money plays a very important role in facilitating economic development and efficiency. It is now clear that the importance of a well developed, healthy, competition and market based financial system is even greater than suggested in the original review. Healthy and efficient financial institutions capable of allocating saving to the most productive investments and of prudently managing the risks involved cannot be built overnight and require a liberal but supportive environment. A supportive environment includes stable prices, accounting systems

and standards that depict the true conditions of firms, legal systems that clearly establish and enforce lender's rights (e.g. for collateral and foreclosure), and 'regulatory' or supervisory agencies that focus on the soundness and honesty of financial firms rather than on where they allocate saving. An increasingly integrated world economy has made it more costly and difficult to shelter the allocation of resources from market forces. It is clearer than ever that all economies benefit from market-related interest rates, exchange rates and resource allocation. Establishing and maintaining a healthy, stable monetary system is not and will not be easy but it is important for the pace of development.

Notes

[The views expressed here are the authors' own and do not necessarily reflect the view of their respective institutions.]

- 1 This chapter was first published in *Economic and Political Weekly*, November 17, 1979 (Volume XIV, No 46). The book *Money and Monetary Policy in Less Developed Countries* was published by Pergamon Press in 1980.
- 2 These aspects of the financial sector's contribution to economic growth were expanded upon in the *World Development Report 1989: Financial Systems and Development* to which both authors contributed.
- 3 The Savings and Loan and banking insolvencies in the United States have other causes. These are primarily the consequences of excessive risk taking without effective supervision encouraged by deposit insurance (moral hazard), regional (state) limitations on the activities of individual banks, and other restrictions on the nature of the financial services bank may provide.
- 4 If the objectives of the directed credit policy were ill advised in the first place, activities that circumvent and thwart those objectives might improve the social welfare, but to a more limited extent and at a higher social cost than would unrestricted market allocation. See Gordon Tullock (1967) and Jagdish Bhagwati (1982).
- 5 For evidence that there is considerable capital mobility even for many countries generally considered relatively closed, see Haque and Montiel (1990).
- 6 The real quantity of money is basically demand-determined in any event. This observation is not meant to deny that the rate of growth of nominal money supply, by determining the rate of inflation, influences the cost of holding money, and hence is an important determinant of the demand for real money balances.
- 7 Borrowing abroad for the purpose of financing the purchase of foreign goods, of course, results in an immediate current account adjustment (and therefore capital flow) with no effect on exchange rates (except as might result from changing foreign perceptions of credit-worthiness, etc).
- 8 This is the overshooting phenomenon in the Dornbusch sense. See Dornbusch (1976).
- 9 A so-called political business cycle could be observed in many industrial countries as a

result of governments' attempts to exploit the short-run Phillip Curve to increase employment in periods preceding major elections. The long-run effect of these increases in aggregate demand was an increase in inflation. See Kydland and Prescott (1977).

- 10 The following draws heavily on Khatkhate and Cho (1989) and Coats (1990).

Optimising Customer Service in Telecom Operations

Beyond Holding Companies and Protocorporations

S K Bhattacharyya

The Athreya Committee was set up last year to recommend an appropriate organisational structure for telecom operations. This article reviews the recommendations it has made, the objections which have been raised and the pros and cons of the alternative proposed and concludes by proposing a third alternative model.

IN December 1990, the Union communications minister appointed a committee to recommend an organisational structure to make the telecommunications operations more effective and efficient consistent with the objectives of the national telecommunications strategies and policies. The committee was headed by M B Athreya, a distinguished management professional. The members of the committee included Sam Pitroda, the chairman of Telecom Commission, N Vittal, secretary, department of electronics, V Krishnamurthy, former SAIL chairman, M P Shukla, managing director, Mahanagar Telephone Nigam, H P Wagh, member (services), Telecom Board, P V Desai, controller general of accounts and O P Gupta, a leading trade unionist. The committee was required to finalise its recommendations by early February 1991. Several specialists in the management field were puzzled by the move which assigned the task of designing the organisational structure of a large and complex technology driven operations to a disparate group of experts with no particular common professional or experiential linkage or expertise in the area of designing organisational structure.

Within the very short time available to the committee, it met and heard a number of senior officials of department of telecommunications, user ministries, business associations, representatives of customers, and managers' and employees' associations and unions. It is to the credit of the committee that it met the deadline of early February and that the summary recommendations arising from the report was available to the public and the press by first week of March 1991.

As was to be expected, the divergent and disparate background of the committee members led to differences of opinion. A majority of the committee members recommended the setting up of an 'umbrella' holding company with four subsidiary regional corporations for the western, southern, eastern and northern regions. The committee has also recommended the creation of a long distance communication related corporation based at Hyderabad. It has also been recommended that the Telecom Commission should continue as the policy-making and regulatory body, while the holding company and the subsidiary

regional corporations function as autonomous bodies charged with the responsibility of effective and efficient telecom operations. The committee has also recommended the creation of a Telecom Finance Corporation to raise funds from the market. An important recommendation of the committee was that a centralised training institute be set up at Ghaziabad by clubbing together the regional training institutes into an autonomous body. Telecommunications Consultants India, Indian Telephone Industries and Hindustan Teleprinters were recommended to be placed under the supervisory and administrative control of the Telecom Commission.

Predictably the member of the committee representing the Telecom Commission, the controller general of accounts and the trade union representative opposed the recommendation relating to the creation of the holding company and the formation of regional autonomous corporations for telecom operations. P V Desai, the controller general of accounts presented a new concept called 'protocorporation', which would be in place for three to five years, before switching over to a corporate organisation. According to him, such protocorporations would function within the governmental structure but be guided by three basic considerations, namely, they would function (i) As genuine customer oriented work culture based organisations, (ii) With growth and profit orientation and (iii) Without doles or subsidies from the parent organisation or government.

This intermediate stage of a protocorporation based structure—a concept which is conspicuously missing from all management literature relating to private as well as public sector business enterprises—was in the opinion of Desai, necessary to build up the required financial reserves. Such reserves were seen to be needed to meet the additional requirements of cash expenditure which would have to be incurred as interest and financial charges after the corporate structure was brought into place. This somewhat unique concept is based on the premise that if more financial and operational powers are granted within a governmental set up, the telecom employees will be concerned about customer service and satisfaction in order to generate surplus for

the creation of reserves notwithstanding the fact that neither their compensation nor their performance would be based on the earning of such surplus. If past history is any indication, such surplus creation is likely to take place in a governmental set up essentially by increasing the administered price, i.e., the telecom tariff. It is unlikely that such action will either be seen as providing excellence in service or generate satisfaction amongst customers. Since the protocorporation concept is basically without substance (and structural merit) it was sought to be camouflaged by accounting gimmickry. It was assumed that the additional charges that might come about when telecom operations function under a corporate set up would be accounted for by what was termed by Desai as 'proforma' entries in various reserve funds (which will be later used for meeting the additional cash requirements at the corporate stage) while any charges such as interest on loan, etc., will be made by way of notional book entries without any requirement of actual payment of cash.

If the authors of the Generally Accepted Accounting Principles (GAAP) prevalent in the industrialised countries of the West or members of the International Accounting Standards Board were confronted with the Desai plan, they would most probably, have severe problems in comprehending the accounting innovation suggested and in trying to absorb the shock of traditional financial accounting norms being replaced by expediency driven simulation based accounting.

When gameplaying of this kind replaces genuine analysis and exploration of basic issues and objectives for conducting such an organisational exercise, it is only to be expected that substance will be replaced by shadow and sleight of hand tricks will pass off as organisational innovation and will focus on pedestrian varieties of managerial acrobatics.

At this stage, it is perhaps useful to go back and examine the basic objectives which were specified at the time of the constitution of the Athreya Committee. These were:

(i) Formulating an appropriate organisational structure for the management of telecom services in the country with a view to upgrading operating efficiency and customer services,

(ii) Development of infrastructure of telecom services to meet the growing needs of industry, commerce and administration.

(iii) Improvement of operational productivity and introduction of changes for technological upgradation.

(iv) Establishment of an effective regulatory framework for telecom services.

(v) Improvement in the industrial harmony and quality of worklife in telecom operations.

(vi) Raising of adequate resources to meet the massive expansion programme of the telecom sector and

(vii) Fulfilling the commitment of providing telecom services in rural areas and meeting other social objectives.

A close and detailed examination of these objectives would reveal that several of these objectives essentially relate to operational considerations while others relate to resource generation, technology upgradation and regulatory tasks for ensuring the attainment of national objectives with the required commercial and operational efficiency. It should also be clear that these two streams of organisational objectives have distinctive structural design considerations even though they relate to the same continuum of telecom operations. The complexity in organisational design in such operations primarily arises on account of the fact that the objectives which underpin such performance have considerations often related to the requirements of time, resources, funds and priorities in operations. Therefore their design requirements are distinctive in the context of conflicting demands in terms of allocation of funds, tariff pricing of services, surplus generation (versus development) requirements, short term revenue considerations which are at variance with long term capital expenditure allocations. For example, the quality of telephone service can be significantly improved by scrapping Stowger exchanges and replacing them by electronic exchanges. But such a step will require such a large outlay of funds that significant future development and expansion will not be possible, leading to some improvement now but chaos later. The need for such temporal balance is perhaps best illustrated in the case of some other public service operations, i.e. railways which have been starved of capital expenditure on account of the totally unrealistic tariff structure addressed to satisfy politically sensitive constituencies like the huge population which commutes from the suburbs to metropolitan city centres. The result is that the system is truly creaking at the joints.

The painless (and expensive) solution in such a situation is to opt for structural palliatives like the umbrella holding company, which was conveniently adopted by the committee. As has been evident for quite sometime—almost in a Pavlovian manner since the days of the Arjun Sengupta Committee report—it is assumed that any complex organisational problem will disappear if there is an umbrella holding company

which acts as the benevolent but firm Godfather who will provide enough leeway to the children but ensure that they behave themselves (and come up to parental expectation). The utter lack of structural efficacy of this alternative without the required organisational strategies—which tie and bind them—and the operational culture and systems which insure that they function effectively has been apparent for several years. Yet the emotional attraction of prescribing an umbrella holding company is a sure all for organisational ills is so extensively prevalent that neither the political overlords or the omniscient bureaucrats are willing to look at this phenomenon of structural failure in the eye. The umbrella holding company has the implicit merit of permitting all operations below to be run on a decentralised basis and accordingly delegating a portion of power to operating levels relating to operational planning, resource allocation, decision making and control. Decentralisation has become such a virtuous cult that it is assumed that it is a panacea for all organisational ills. There is very considerable evidence that decentralisation is extremely beneficial for achieving organisational effectiveness and efficiency when it is clearly related to those operations and activities at the delegated level which determine the success of the operations of the enterprise. This dimension related to decentralisation has also to be related to such contextual factors like:

(i) Ability to make quicker decisions and provide expeditious responses based on local knowledge and understanding.

(ii) Greater knowledge and insight about the matters to be decided upon because of the operational involvement in such activities and localised presence.

(iii) Access to information which is available at the locus of such decentralised decision making.

(iv) Availability of prior experiential knowledge which allows decentralised decision making on the basis of guidelines.

(v) Better judgement relating to the level of risk involved in it.

(vi) The implications of the current decisions on the future financial health of the organisation and continuing success of the enterprise.

It should be reasonably clear that there are several aspects relating to strategies, policies, systems (and even operational planning) and decision making involving activities which are of such magnitude or involve such risks that they have implications for long term health and success of the enterprise which cannot be decentralised. In such a situation it is clear that the strategic and policy aspects of organisational functioning need to be centralised. The managerial dimensions which will bind decentralised operational decision making, with centralised strategy and policy formulation and implementation are:

(a) Mutually agreed target setting—both for financial and operational performance.

(b) Performance reporting in relation to targets both for the period under review as well as the cumulative period from the beginning of the operational plan or budget.

(c) Data relating critical variables and related effectiveness indicators (e.g. average time taken to respond to customer complaints and system faults, waiting period for application for new line, response time for operational services provided, trunk call maturity time, idle PC (%) percentage, settlement time for disputed bills, etc.) and

(d) Periodic personal meetings and discussions for two way information sharing and briefing as well as identification of alternatives for shifts in current policies and procedures.

The concept of an umbrella holding company and autonomous regional corporations, therefore, fall prey to the unsubstantiated and unwarranted assumptions about the efficacy of decentralisation unless the context and validity of such decentralisation is determined with reference to the distinctive criteria for organisational effectiveness in the telecom service based operation.

Decentralisation is indeed a vital necessity but it must be related to organisational aspects where such decentralisation is relevant, beneficial and appropriate. It must also be related to what is often referred to as critical determinants of operational success—i.e. those resource allocation and implementation decisions which ensure organisational success. In the telecom context such operations would probably relate to response to customer complaints, expeditious resolution of transmission and communication problems, prompt settlement of disputes and settlement of claims, allocation of funds, equipment, etc. It is a human power where a critical choice of determination on the basis of relative organisational requirements for activities etc. The Ashree Committee seems to have been so preoccupied with the form of the structure that it has lost sight of the *purpose*. The information base that has been lost sight of and missed in a debate about ideological issues like privatisation versus government department based operations and in recent concepts such as centralisation versus decentralisation.

If one accepts the premise that the telecom operations are essentially meant to provide communication service to customers for purposes of communication between point A to point B most effectively at the best economic cost in the context of customer need for facilities, timing, etc. it is not clear why an umbrella holding company provides the required response. One must ask the following question: which are the organisational strategies which telecom operations must adopt in the unique locational and customer need contexts to satisfy different customer segment needs? This is the basic *raison d'être* for telecom operation. In such an event if these customer group specific strategies can be identified following

the classic recommendations of Alfred Chandler—the structure should be designed so as to ensure that it becomes an effective tool for implementing the chosen strategies. While it is not feasible to identify such strategies in relation to telecom operations in any significant detail in this paper without a detailed exploration of the variables which underpin such strategies, it is possible to identify the broad-order objectives which need to be achieved by such strategies. These are

(a) Availability of telecom service—both by way of local and trunk services in a free and abundant measure be it at the customers' home or office or in public call offices at airport or other such public places,

(b) The time taken to locate and communicate with the respondent party,

(c) Quality of service in terms of speed of service, and clarity and ease of communication

(d) The economic price for such services consistent with the cost of rendering such services on the one hand, the benefit derived by the customer from such services (dependent on the duration of the call, time of the day, when the call is made, logistics of transmission of the call, distance of destinations involved, etc.) on the other

(e) Variety in terms of services provided to respond to the distinctive needs of the customer keeping in view the manner, mode, timing, process of communication adopted by the customer, and

(f) Expedient response to the problems encountered in terms of functioning of the customers' facilities, transmission, responses from the exchange, problems of locating the called party, billing, settlement of claims (including excess billing), etc.

It was Raymond Corey and Steve Starr who in their path-breaking book on organisational design for marketing driven and service based organisations pointed out that the structure of such corporations should not only be related to providing the most effective and efficient service but should be differentiated in terms of customer segmentation such as the size of operations of the customer, unit value of transaction, distinctive needs of the buyer in relation to his operations, specialised customer needs required to be served, etc. Corey and Starr illustrated their proposition by many examples such as IBM defying organisational wisdom and structuring their operations neither according to the hardware categories or software classifications, but on the basis of the customer group sought to be served, in structuring its organisation. The net result was that IBM divisions follow such unusual structural modules (or profit centre based operating divisions) as government operations, education and scientific institutions, business corporations, individuals, etc.

The author and his colleague Ishwar Dayal used—while they were at the Indian Institute of Management, Ahmedabad—a similar model for restructuring the very large

operations of the State Bank of India at the time of the transition to social banking by moving from a deposit-and-loan based structure or domestic or international operation based structure to a customer group structure related to five distinct categories of bank customers, i.e.

(a) Personal banking customer,

(b) Commercial and institutional customers,

(c) Agricultural banking customers,

(d) Small industries and small business customers, and

(e) International banking customers

However the organisational design problem of structuring such service enterprise operations is a complex matter beyond merely identifying customer groups. It is also required to identify both on consideration of strategic and policy control as well as on economic cost and operational effectiveness—common services and managerial functions to be assigned to the identified customer segment modules in the organisational structure. The 'eager beaver' proponents of the cure all profit centre or strategic business unit concepts often recommend with missionary zeal that all customer segment based profit centres must have the entire range of services and functions such as accounting, personnel, maintenance, R and D, purchase administration under them individually in order to have the level of autonomy necessary for making such structures effective. In their view only then will accountability be matched by authority and access to resources. Unfortunately this prescription suffers from an emotional hang up and has all the problems which usually result from blindly believing old wives' tales. In fact neither mechanical decentralisation nor routine allocation of services and functions are necessary unless a detailed examination and analysis is carried out as to which services and functions are critical to the success of that customer group's operations and are therefore, required to be structurally placed within the customer group module. Those who have extensive experience of designing organisational structure for service enterprises know that the requirements of such services and functions vary hugely. They are dependent on the nature of the service provided and the context of the requirement for effectiveness and efficiency in providing such services. The support functions and services which require to be provided in cargo customer module in an airline structure are vastly different from those in a corporate banking module in a bank structure. In other words there is no simple rule which will be universally applicable to all service organisations either regarding decentralisation or allocation of directly available functions and services. They have to be related to—as has been highlighted earlier—the critical needs of specific customer groups. It is clear that in the telecom context the structure must admit of another dimension, namely, the regulatory requirement of a public utility service

with all its connotation about investment, dispersion, tariff, linkage with equipment and accessory suppliers, co-ordination with external agencies, particularly foreign governments and telecom agencies.

The Athreya Committee model does not at all attempt to explore these very basic and critical issues in relating customer servicing needs to organisation structure criteria possibly because the compulsive requirement of resolving the ideological debate relating to privatisation and government department-based operations, and managerial merit of decentralisation versus centralised operation became matters of such obsessive concern and anxiety that the basic assumption that telecom services exist primarily to serve the needs of the customer was perhaps never identified as the basic structural reference point. It is, therefore, natural that the further step of grouping these customers in terms of their distinctive needs, unit size of operations, specialised requirements of communication, requirements of newer services and products and transaction volume (and revenues) in different operational segments as differentiating criteria never arose.

CUSTOMER SERVICE BASED STRUCTURE

If these criteria were in fact applied, it would immediately be apparent that there are basically three customer segments whose needs are significantly different so as to merit structural differentiation and accordingly, would need to be structurally spaced in the organisation design. These are: (a) individual customers, (b) business customers, and (c) government and administrative bodies/departmental customers.

It is entirely possible—and appropriate—to further sub-divide each category of customers in sub-categories such as: (a) domestic local operations, (b) domestic trunk and STD operations, (c) international trunk operations, and (d) other services (including telex, fax, etc.)

There can be many structural problems—as is the case with several service organisations—in relating such a customer segmentation configuration to the operational context. There are preponderant needs of combining the customer segment operations in terms of common functioning, e.g. common exchanges, transmission lines (overhead and underground), switching lines and other services. In addition, of course, there are common considerations relating to personnel policy administration, human resources development, fund raising, common administrative facilities at locations, capital expenditure sanctions, technology acquisition, government and regulatory agency related relationship, etc. which would need to be administered and managed from a common organisational perspective. Yet it is entirely possible and necessary, to transit from a purely locational structure, recommended by the Athreya Committee to a customer-based structure to optimise the efficiency and effectiveness of telecom operations. Dramatic evidence of the need,

... vividly provided in March 1991 when British Telecom changed its organisational structure from 27 common districts serving business, domestic and international clients to a new customer-based structure which differentiated the 7 million lines-based business customers from the 18 million lines-based domestic customers operated with the support of a worldwide network and guided and managed by common group headquarters and selected zonal offices.

The question which will need to be answered in this context is what will be gained by a customer-market centred organisation. The first and foremost of these will of course be the homogeneity of the structure in terms of the common tasks of serving a specified group of customers, e.g. business customers, individual customers or institutional/administrative customers. The requirements of services of these three groups are so widely different that by tailoring the structure to the customer segment, the understanding and insights about customer requirements which are so critical to customer servicing will emerge. This will lead to several other benefits such as specialisation, expeditious response to problems and, most importantly, identification with the customer. Such a structure would then be able to deal with the operations on an 'entrepreneurial' basis by constantly endeavouring to optimise its performance. Such optimisation will have to be backed up by provision of required support function and services to the customer segment structure based on the test whether such support functions and services are truly critical for the effective and efficient servicing of the customer group's needs. On similar considerations the authority for planning, resource allocation and implementation of action plans would need to be delegated to the customer segment structure for responding to the needs of the customer group. The affiliation with a specific customer group will also lead to a mutuality of purpose which is clear in its objectives and goal of subserving the customer group. The operations would then be uncluttered by the need to simultaneously respond to requirements of other customer groups who have other distinctive needs, often at variance with the primary group of customers, and leading to conflicts of time and resource allocation and determination of priorities of managerial action.

It is, however, necessary to understand that the effectiveness of a customer group-based structure is substantially dependent on how efficiently a common network of exchanges and transmission facilities meet the needs of all the customer divisions. This is indeed a complex question because such an operational set-up would not be structurally affiliated to any customer division and would, therefore, have to determine priorities in serving these divisions as also the economic costs for providing such services. In relation to the first issue

... support to a customer division, it would be important to develop from the very beginning ground rules regarding such operational priorities in terms of time and resource allocation. Even in a functional organisation these ground rules are essential and are usually dealt with by using electronic equipment which are programmed to deal with problems of prioritisation based on instructions incorporated in their memory as the basic logic in dealing with such prioritisation problems. To give an illustration, non-linear programming models of optimisation between transatlantic international calls are swiftly handled and prioritised thanks to the linear programming (LP) model logic incorporated in their relay and switching systems. This has been accomplished notwithstanding the immense complexity involved, including the fact of several international telephone companies at different locations being involved as active participants in carrying out the complex task of international communication.

The problem of pricing of operational services between various divisions is much more complex. No matter which structure is specified, a transfer price for operational services would have to be worked out after taking into account the relative volume, duration, complexity of transmission and administrative and technical support required. However, what has emerged reasonably clearly in structuring telecom operations is that the exchange and transmission operations should not be constituted as profit centres as any build-up of profit in their financial and cost accounting format cannot only be an extremely complex task but would also substantially vitiate the process of rational decision-making. This will happen due to such notional profits obscuring the managerial economics of the transaction primarily because such operational profit would be a national amount or a shadow price unrelated to actual financial cost in carrying out the switching and transmission operations.

The questions that has to be addressed is that if in the Indian telecom context, a customer-based structure is to be adopted, what would be the specific dimensions of such an organisational design. In the first place, each of the three customer divisions would, no doubt, have a common regional office in the west, south, east and north regions so that they could interact at a common operational level to resolve any problems of co-ordination. These regional set-ups would be the extended operational arm of the corporate office for simultaneously providing the integrated organisational perspective in the differentiated customer-group based operational structure. However, the concept of tailoring the structure to customer needs would mean in practical terms that the branch organisations of the three divisions need not be at the same location. Such locational decision would have to be based on the optimal

... considering the size of the customer division's customers. The span of operational control of the branches of the three divisions should be determined by the dispersion of the customers in the specified territory or district.

The operational division responsible for the transmission and exchange operations would be basically concerned with the physical dimensions of the communication, switching and transmission operations. Given this specification, the need for making the changes in the location of the major exchanges, or transmission and relay stations or maintenance divisions would not be significant. It is worth repeating again that the operations division would not be a profit centre and the reference point for its performance would be in terms of physical parameters of operational efficiency and ef-

activities (for which predetermined targets of operational performance will have to be jointly agreed upon and specified).

The national headquarters or corporate office in this scheme would be staffed by the heads of activities of not only the three customer divisions and the operational division, but also the functional departments relating to personnel, finance, planning, projects, research and development, etc. While the corporate functional departments would be basically concerned with the formulation of their respective functional strategies, policies, procedures and systems, the administration of such functional activities in the customer-based divisions as well as the operating division would essentially be accomplished by providing functional support to these divisions on the basis of their specific requirements of such support service functions. In this scheme, the functional managers assigned to the customer divisions or the operating division would be a part of their respective division organisations. They would be responsible for ensuring that the administration of their functions is carried out in relation to the division's operations in conformity with the functional strategies and policies specified by the corporate office procedures and systems. In such an organisational design, the functional managers in the divisions will report functionally to the heads of functional activities in the corporate office but be operationally or administratively responsible to their divisional managers.

ROLE OF TELECOM COMMISSION

This still leaves the requirements of organisational design of regulatory and policy functions regarding telecom operations open. These functions would essentially be performed by the Telecom Commission in the ministry or a regulatory set-up in the Central government. In actual practice, the Telecom Commission represents the government in planning, monitoring and guiding the operations of the National Telecom Corporation (referred to earlier as the corporate office for telecom operations). The Telecom Commission would also have the responsibility for the following:

- (a) Formulating the telecom strategy in the longterm;
- (b) Ensuring that operational, technological, financial and personnel policies flowing from the longer term telecom strategy are also clearly formulated and reviewed from time-to-time to ensure that they are in alignment with the national needs of effective and efficient telecom communication requirements;
- (c) Ensuring the availability of equipment and accessories for carrying out telecom operations (which will include supporting and sponsoring the design, technology and manufacturing of such telecom equipment and accessories both in the public and in the private sector);
- (d) Raising resources for the longer term

funding needs of the National Telecom Corporation;

(e) Providing support to the upgradation and induction of technologies which ensure that telecom operations are carried out taking advantage of developments in technology and equipment which make them truly effective and efficient; and

(f) Ensuring the technical and managerial training and development of telecom personnel, so that both their operations and management are carried out at the highest level of effectiveness and efficiency.

It will be seen that in the proposed structure the role of the Telecom Commission is envisaged essentially as a regulatory body which oversees the constant development of telecom facilities in the country to meet the communication needs of its population, administration and business. The Commission will also have the longer term responsibilities regarding technology development, financial resource generation and human resources development which would be the pressing needs for the continuing effectiveness and viability of telecom operations. Translated into specific terms, the Telecom Commission, representing the ministry of communications, would be a major (say 51 per cent) shareholder in the proposed National Telecom Corporation (along with individual investors who might wish to subscribe to the shares of that corporation). The Telecom Commission would also have under it fully-owned subsidiary corporations charged with the responsibility of the longer term organisational requirements of an effectively run telecom operations. These would be:

- (a) Telecom Finance Corporation;
- (b) Telecom Research and Development Corporation;
- (c) National Telecom Training Institute; and
- (d) National Telecom Planning Organisation

The first three organisations would be profit centres offering their professional services to the National Telecom Corporation (and their respective regional set-ups) for a fee. They will act as the specialised bodies in their respective areas of functioning and would be free to provide such services to other telecom organisations outside the country, to telecom-related organisations in the public and private sectors and to carry out advisory and consulting activities in their own respective fields.

The National Telecom Planning Commission would essentially be concerned with preparing the longer term telecom strategic plan which takes into account the requirements of the users, the operational and technical requirements for future telecom operations, the need for financial resources, equipment and personnel in formulating the long-term corporate plan for telecom operations.

CONCLUDING REMARKS

While the above structure is not offered as a panacea it needs to be seriously considered as an alternative structural model which focuses on customer servicing as the key reference point for organisational design while recognising the distinctive needs of operational and regulatory planning and control. The debate can then shift from the meaningless squabble about relative merits of privatisation or functioning as government-based corporations or as protocorporations. It will also steer clear of the emotional debate on the merits of centralisation or decentralisation in operations, and proceed to blend the distinctive requirements of customer servicing, technology-based operational efficiency, and policy planning, monitoring and control as distinct, but necessary, parts of a total organisational design for telecom operations.

INTERNATIONAL JOURNAL OF DEVELOPMENT PLANNING LITERATURE

A QUARTERLY JOURNAL PUBLISHED SINCE 1986

Editor S Bhagwan Dahiya

CALL FOR PAPERS

The International Journal of Development Planning Literature invites research papers from authors for publication in this Journal. The Journal aims at to publish (a) Original Research papers on any aspect of development, (b) a comprehensive and balanced review of the recent literature in some subfield of development planning, (c) one or more essays giving reactions of generally recognized leading development planners to his (or her) recent professional reading, and (d) when appropriate, a review article on some particularly outstanding book. Authors should send three copies of their papers to.

Notes forming Part of the Accounts for the Period ended 31st March 1991

- The branch was formally opened to the public on 8th October 1990 and hence there are no figures pertaining to the previous year
- Infrastructural expenditure towards setting up of the branch amounted to Rs 14 077 538 89 of this an amount of Rs 7 886 107 09 incurred during the period from 16th June 1989 to 8th October 1990 has been charged to the Profit and Loss Account for the period ended 31st March 1991. The balance amount of Rs 6 191 431 80 has been capitalised
- No provision for taxation has been made as the taxable income is nil
- Principal Accounting Policies
 - The accompanying financial statements have been prepared on the historical cost basis and conform to the statutory provisions and practices prevailing in the country
 - Transactions involving foreign exchange
 - Monetary assets and liabilities have been translated at the exchange rate prevailing at the close of the year. Non monetary assets have been carried in the books at the contracted rates
 - Income and expenditure items have been translated at the exchange rates ruling on the date of transaction
- Investments
 - Investments in Government and other approved securities in India are valued at cost
 - Advances
 - Advances have been stated net of Bills re-discounted
 - Fixed Assets
 - Premises and other fixed assets have been accounted for at their historical cost
 - Depreciation has been provided for on the straight line method at the rates specified by Head Office. In respect of subsequent additions depreciation is provided for the relevant quarter in which the additions are made
 - Staff benefits
 - Contribution to the Gratuity Fund (pending approval of the authorities) has been made as per actuarial valuation report
- Remuneration paid to the Chief Manager, India
 - Salary, bonus and allowances
 - Perquisites evaluated in accordance with the Income Tax Rules

Auditors' Report on the Indian Branch of Barclays Bank PLC under Section 30 of the Banking Regulation Act, 1949

We have audited the attached Balance Sheet of the Indian Branch of Barclays Bank PLC as at 31st March, 1991 and the relative Profit and Loss Account of the Indian Branch of the Bank for the period from 8th October, 1990 to 31st March 1991, signed by us under reference to this report. In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and the Profit and Loss Account, together with the notes attached thereto, are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act, 1956. The accounts are therefore, drawn up in conformity with Forms 'A' and 'B' of the Third Schedule to the Banking Regulation Act, 1949.

We report that subject to and read with the foregoing remarks

- (1) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purpose of our audit and have found them to be satisfactory.
- (2) The transactions which have come to our notice have been, in our opinion, within the powers of the Indian Branch of the Bank;
- (3) In our opinion, proper books of account as required by law have been kept by the Branch so far as appears from our examination of those books maintained and produced to us at Bombay.
- (4) The above mentioned Balance Sheet and Profit and Loss Account of the Indian Branch of the Bank dealt with by this report are in agreement with the books of account.
- (5) In our opinion and to the best of our information and according to the explanations given to us, the Balance Sheet and Profit and Loss Account, together with the notes thereon, and read in particular with Note 2, regarding infrastructural expenses, give the information required by the Companies Act, 1956, as amended in the manner so required for Banking Companies, and on such basis give a true and fair view in the case of the Balance Sheet of the state of affairs of the Indian Branch of the Bank as at 31st March, 1991 and in the case of the Profit and Loss Account of the loss of the Indian Branch for the period ended on that date.

Political Economy of Struggles for Democracy and Human Rights in Africa

Yash Tandon

Western popular and journalistic literature often ascribe the quite evident failure of bourgeois democracy in Africa to the 'African' tendency towards dictatorship and one-partyism, or simply tribalism. African politicians on the other hand, argue that it is the European 'democrats' who for a century or more smashed all existing pre-colonial institutions and practices of tribal democracy and instituted unbridled authoritarian rule. Some African countries turned to the Soviet Union and China for a different model of democracy, only to learn that in later years what existed in practice was yet another variant of dictatorship. For Africa, therefore, there are no more models of democracy. For once African masses must work out their own system of governance.

IT is often forgotten that John Stuart Mill the father of western liberal democratic theory, was not in favour of universal suffrage. He was against giving vote to those who were illiterate and who did not pay taxes. Even amongst those who qualified for vote should not, he argued, have equal vote for those who were better educated and therefore more capable of political judgment, deserved more votes than those less educated. A century and half later Ian Smith of the then Rhodesia was to use the same argument to deny franchise to Africans. By Mill's standards Ian Smith was a 'liberal democrat'. Or was he? What has changed—the theory or the reality?

The neo-classicals from Adam Smith onwards argued that the capitalist free market system maximised 'utility' for all, and everybody got his or her due as the market tended towards an equilibrium until, a hundred years and a few fiascos later, the English political economist Keynes showed that theoretically equilibrium could be reached at any level of unemployment and that the utility was not automatically maximised or equalised. The state, he argued, had to intervene to correct the disequilibrium which was the natural tendency of capitalism (and not equilibrium). Clearly the reality had changed, free competition was already history and Keynes was writing in a period when pricing in the world market was no longer set by competition but by the few monopolies who financed and controlled commodity production and marketing.

Bourgeois democracy reached its highest theoretical peak with social democracy. The free market, this theory admits, will not equalise utility for all, there will always be those who are 'disadvantaged' by the system, and therefore the state must intervene to provide them 'welfare', a chance to 'equalise' access to material (and social) goods. The Scandinavian countries are today regarded as the models of 'social democracy'. Now however, there are increasing complaints that the system encourages parasitism—the lazy and the socially marginalised feeding on an increasingly small section of the active working population. In Margaret Thatcher's Britain they are reverting to 'privatisation' of the social services, away, that is, from the hitherto respected tenets of social

democracy. Social democracy, thus, has its own limitations, but above all a lack of considerable significance for the Third World—Western social democracy, let us be clear about this, thrives on the backs of the severely exploited peoples of the Third World. Social democracy, in other words, is no less imperialist than its more 'honest' liberal democratic variant.

Both these variants of bourgeois democracy—liberal democracy and social democracy—are paraded in Africa as 'models' to emulate, but neither of these has succeeded in taking roots—and never will. Liberal bourgeois democracy will not take roots because there is no African bourgeoisie that is strong enough to fight against imperialist hegemony whilst at the same time keep at bay the threat of working class takeover where imperialist hegemony weakens. As for social democracy, that was a peculiar compromise between certain class forces at a certain time in Europe's industrial development: the objective conditions for which do not exist in Africa (or, for that matter, in the rest of the Third World).

Western popular and journalistic literature, in their simplicity and naivety, ascribe the quite evident failure of bourgeois democracy in Africa to the 'African' tendency towards dictatorship and one-partyism or simply to tribalism (the catch all root cause of all problems in Africa). African politicians, on the other hand, argue that the European 'democrats' have no moral authority to preach them about 'democracy' when for a century or more what they did in Africa was to smash all existing pre-colonial institutions and practices of tribal democracy and institute unbridled authoritarian rule.

Some African countries turned to the East (the Soviet Union and China) for a different model of democracy—workers' democracy. At least this is what they thought. 'Marxism-Leninism' was offering them, only to learn two or three generations later that what existed in practice in these countries—at least in later decades after the socialist revolutions—was yet another variant of dictatorship, the dictatorship of state or bureaucratic bourgeoisie. The awakening was all the more shocking because of its suddenness and because the existing dictatorial rul-

ing cliques in these countries, forced by a groundswell of opposition from below, themselves acknowledged their own 'historical crimes'. Over a period of barely six months in 1989/90, Eastern European regimes fell like dominoes, and erstwhile 'Party loyalists' fell over one another in an indecent haste to distance themselves from past practices, an inward guilt transformed into an external witch hunt with the 'Party' as the main culprit. In Hungary, for example, the Communist Party committed suicide and was reborn, Sphinx like, as a 'social democratic' party.

For Africa, therefore, there are no more models of democracy. The situation is excellent. For once African masses must work out their own systems of governance.

Of course, African masses are not likely to be allowed by powerful global economic forces and local political interests to think out their own solutions. There is too much at stake. At the political level all the current dust blowing about one two or multi-party system (and the condemnation of African countries for their tendency to one partyism) is a nice piece of political propaganda for the bottom line is the preservation of the capitalist system and western dominance of Africa. Yesterday, for example, it served French interests to back one-party rule in Africa and they were actively involved in smashing all opposition to one party rule; today it no longer serves their interest and they now talk about political pluralism. The preservation of western hegemony is a shared value of all the ruling oligarchies of the West, no matter whether the party in power is 'liberal' democratic or 'social' democratic. What is not politically acceptable to them is for the masses in Africa to seize power and control their economies: this is the single biggest obstacle to democracy in Africa. The collapse of workers' democracies in Eastern Europe has added grist to the mills of bourgeois democrats of all hues. The only game in town they say, is free market capitalist democracy.

This essay argues that democratic rights are never conceded from on top by the ruling oligarchies, that they are always won by the oppressed and exploited people themselves as a result of intense struggle against

the ruling oligarchies, and that therefore the only route for the African masses to expand their democratic rights (because by securing political independence from colonial rule they have already won partial rights) is to continue in their opposition to the present capitalist rule in their countries. However, there are obstacles on the way, not insurmountable in the long run, though in the short run quite formidable.

DEMOCRATIC RIGHTS AS A DIALECTICAL OUTCOME OF PEOPLES' STRUGGLES

There is a debate going on, initiated in Africa first but now joined in by scholars and human rights activists in the West, as to whether it is correct for western nations to make judgments on the character of the regimes in Africa on the basis of western value systems. Those who say it is not correct to do so argue that Africans can be understood only within their own cultural context, and therefore judgments about Africa derived from western values are apt to be at least misleading if not downright dangerous and chauvinistic. The opposite is argued by those who say that there are certain principles that are universal by which to evaluate the performance of governments in relation to their populations, and therefore all deviations from these principles must be universally condemned.

Like all debates on such fundamental philosophical issues a simplistic rendering of the alternative perspectives robs reality of its complexity and contradictoriness. The debate becomes all the more obscure because of political undercurrents.

In the rejection by African democrats and human rights activists of 'Western' values there is an anti-imperialist undercurrent. It is part of the rejection of the dominance of the west over Africa. The same argument—i.e., that Africans must be judged by their own value systems—in the hands of Western democrats and human rights activists, however, becomes a patronising deference to violations of human rights by Africans as if to say that African actions must be judged by a 'lower' standard of morality. Africans find this patronising attitude highly objectionable. Torture or the taking of human life pains African conscience as much as it does a Western heart. The fact that there is more torture and killing in Africa than say in Western Europe is a reflection of the historical and current economic and political realities of the two continents (and a reflection, in fact, of the historical relations between the two continents), and not a reflection of the implied 'lower' standard of African morality.

To be sure, every society has its own value systems, but to lapse into cultural relativism as an excuse for condoning violations of human rights and detractions from democracy is dangerous and unacceptable.

In all this philosophical muddle amidst a dynamic and contradictory reality, what is at least clear is that throughout his or

the lower classes have never won a single democratic right (the right to vote, the right to organise into a trade union, the right to form a political party, the right to free expression, the right for their children to education, and so on) without intense struggle on the part of the oppressed and exploited peoples. Western scholars and human rights activists sometimes forget their own history. They think that these rights, having been won in the west by their struggling masses, can now be 'parachuted' on to the soil of Africa without the African masses having to struggle for them.

The 'liberal relativists' amongst them apply variations of the theory of cultural relativism to patronisingly 'explain' African detractions from democracy and civil liberties; the 'universalists' stubbornly cling to western models of democracy and the theory that "rights are inherent in the individual"—a 'natural rights' theory—to make one-sided and abstract (i.e., out of context) judgments on African political realities. Contemporary organisations like the Amnesty International and the recently founded 'World Watch' and 'Africa Watch' are examples of 'universalists' who are judgmental about the Third World but who are silent about violations of human rights by the First World.

Both the liberal relativists and the universalists in the west are guilty of two 'crimes'. First they are guilty of forgetting their own history, and of failing to draw the right conclusion from it, namely, that democratic rights are won through struggle and not 'given' or 'parachuted' from outside. The second crime is that they abstract African reality from its total historical and economic context; they myopically concentrate on the 'current affairs' journalistic perspective thus losing the historical perspective, and they focus purely on the political rights (freedom of speech, etc) leaving out the economic rights (right, in particular, to a just reward for labour).

No 'Amnesty International' existed challenging the rule by Europe over Africa as a violation of the 'inherent' rights of nations to political independence. Every inch of the way, from the diplomatic fora of the League of Nations and the United Nations to the battlefields of Algeria and Kenya, the people had to fight for these rights which were only *post facto* recognised by the imperialist powers as 'inherent' in colonial peoples.

Political independence of Africa was not a gift from heaven. It was an outcome of struggle, although the intensity of the struggle and the degree to which it penetrated to the levels of the lower classes varied from country to country and from time to time. For example, for a certain period in Kenya (in the 1950s) the struggle was extremely intense and involved what amounted to partial insurrection by a section of the lower peasantry (the Land and Freedom Army of the Mau Mau), whilst in other countries (such as in neighbouring Uganda) the struggle, though intense, was less violent.

In the later years of the struggle for independence, the imperialist powers became even more stringent in conceding independence than during the 1950s and the 1960s. We are talking here of the Southern African countries. This was largely because of the presence of the white settler communities in these countries (which introduced the racial factor into the equation, thus complicating the responses of the imperialist powers), and the perceived strategic interests of the United States still fighting the 'cold war' in Africa against the threat of Soviet penetration. Because of the presence of the whites it was necessary to find a settlement that accommodated the interests of the whites with those of African nationalism. The Lancaster House Settlement of Zimbabwe negotiated in 1980 was the classical test case. In addition to 'solving' a problem which agitated both imperialism and the nationalists and which delayed Zimbabwe's independence for nearly two decades, the Lancaster Settlement provided a formula which was later 'successfully' applied to Namibia, and which is being 'worked out' in relation to the prize nation—South Africa.

Negotiated settlements, even those that came after years of bush war, were an accommodation between the conflicting demands of nationalism and imperialism. In practically every case, the African petty bourgeois classes that expressed the nationalist sentiments of the masses, split along tribal or religious or regional lines, and the colonial powers offered their 'mediation' to patch up these differences to put in power a rough-and-ready alliance of petty bourgeois factions who, with the backing of 'development aid' or even standing colonial armies (as mainly in Francophone Africa), continued to maintain the system of imperialist exploitation of the lower classes. Those who did not fall in line (for various reasons), such as Nkrumah and Lumumba, were couped or killed.

What we have witnessed in Africa over the last thirty years (that is since 1957 when the first black African country got its independence from colonial rule) are different (sometimes apparently 'progressive', sometimes utterly retrogressive) forms of neo colonial petty bourgeois 'democracies' arising out of forced and partial responses to demands from the lower classes—the working classes.

The demands from the lower classes have been incessant (without let-up even for a single day), and remarkably consistent and almost unchanging in content (e.g., demands for food and shelter, demand for employment, for land reform, for better prices for crops and lower prices for consumer goods at the economic level, and, at the political level, rights to participation in national policy making) throughout the period since the imposition of colonialism. The colonial powers themselves were either rigidly unresponsive (especially the weaker colonial powers such as Portugal) or partially respon-

demands. Even with those which were partially responsive, their efforts all the time, however, were to ensure that the concessions were made to the lower classes only when there was very little choice left, and even then to make as little concession as possible in order to maintain the system of exploitation which is what brought them to Africa in the first place. That situation continues to prevail in post-colonial Africa. There is an intense struggle between on the one hand the masses who desire democratic freedoms and economic justice, and on the other hand international corporate capital whose only interest is profit, notwithstanding clever public relations exercises to camouflage it.

MAIN OBSTACLE TO DEMOCRACY: CORPORATOCRACY

There is much talk these days about the definition of 'development'. A lot of this discussion is purely abstract, for indeed there are only two definitions of development, no matter how differently they might be presented for the sake of argument. There is first the corporate capital's definition of development which is economic and aimed at 'modernising' the economies of Africa to fit them within the overall structure of the international economy where the rule of capital is paramount. Any opposition to this is either firmly squashed or co-opted; for example, if there are people in the rural areas of Africa not yet fully integrated into the 'market economy' then they must be brought within its 'modernising' orbit, and if there are peasants still using their own local crop seeds and hand hoes, then they must be 'taught' how to use tractors and the 'fantastic' yields that can be realised through using the hybrids. The results of this strategy of 'development' are, for the bulk of humanity in the Third World, disastrous, as we shall soon see.

As opposed to corporate definition, the masses define development in terms of life itself in its totality. Life is not neatly compartmentalised into 'economics', 'politics', 'culture', etc.

Life is one whole. It has to do with the total well-being of humanity in harmony with nature. In trying to control both nature and man (labour) western capitalist civilisation has brought resistance from both nature and labour, as well as from all marginalised and oppressed communities in the world. Whilst the skies are bursting through the ozone layer in protest against the industrialising 'modernisation' of the capitalist world, at the human level the workers, the oppressed peasants of the Third World, the minority communities, the women, the deprived children—all of whom constitute the majority of mankind—are in revolt against this aggressive rule of capital over man and nature. In other words, the definition of development is opposition to the rule of capital and building parallel structures and institutions outside the control of

It is important to put our vision of this dialectic in such broad terms, because only in these broad terms can we appreciate the limits to democracy in Africa. Concretely, the collision course between democracy and corporatocracy is defined in Africa by these conflicting conceptions of 'development' held, on the one hand by corporatocracy and its chief agents, the IMF and the World Bank, and on the other by the masses of Africa.

The corporate strategy, however, is the dominant strategy of 'development' in Africa, as indeed in the whole world. In the case of Africa, the IMF/WB have designed African strategies over the last thirty years and used all the powerful tools at their command, including direct pressure from capitalist countries, to force African countries to adopt these strategies.

Over these 30 years these strategies have failed abysmally. Every time conclusive evidence has mounted showing the failure of these policies, the World Bank has shifted gear and introduced a new set of measures. In the 1960s and the first half of 1970s the strategy was 'import substitution' until it was found that the bills for importation of proprietary technology and know-how (i.e. technology and know-how owned by corporate capital and hence purchased at very high cost) was higher than the predicted savings through reducing importation of finished products, and one African country after another fell into serious indebtedness with the providers of capital. Then, in the latter part of 1970s and the decade of the 1980s the strategy shifted to 'export promotion'. This too, we now know, is failing, although the WB has not given up on this yet.

In pursuance of this strategy the IMF/WB have tightened their 'adjustment' screws on Africa. This involves radical restructuring of the economy in order to remove its 'inefficiencies'. Some of these alleged inefficiencies are: (i) low productivity of African labour; (ii) low capitalisation of industrial and agricultural production; (iii) a low rate of saving and therefore of investment; (iv) a high demand for social service investment leading to reduced net investment for the 'productive' sectors of the economy; (v) a mass consumer demand pushing for higher wages leading to inflationary pressures; (vi) corruption in high places; (vii) a tight import programme against inputs for modernising industry and agriculture; (viii) low producer prices that act as disincentive to agricultural production; (ix) a lax fiscal and monetary policy that act as a disincentive to investment; and so on so forth.

In line with this one-sided and economic analysis, the IMF/WB have suggested a package of 'reforms' to recondition the economies of Africa to make them 'more efficient'. The package makes extremely high demands for sacrifices by the people. The 'social cost' of the restructuring exercise is astronomical. Some of these costs have been

publication, *Adjustment with a Human Face* had this to say about the social effects of the SAP on Third World countries:

The analysis above has shown that among IMF-assisted countries improvements in current account balance were recorded in 56 per cent of countries in the 1980s, but in almost 60 per cent of these countries growth deteriorated or did not improve in the first programme year, and real investment levels also declined or stagnated between 1980 and 1983 in almost 60 per cent of the countries with Fund-assisted programmes. With falling output and, at best, mixed evidence about changes in income distribution in many developing countries, *the number of people in poverty in many 'adjusting countries' increased* (emphasis added).

The authors go to say:

Alternatives must be found. The urgency of finding new solutions is especially pressing when considering the *poverty-inducing effects* that the current approach tends to have, and the *direct negative effects* that some macro-economic policies have on the health and nutritional status of the poorest, and of children in particular, unless they are accompanied by *compensatory measures*...¹ (emphasis added).

Thus there is clear evidence that the IMF/WB strategies have been anti-people.

The one 'social cost' no one mentions is the pressure that the exercise in restructuring puts on the democratic rights of the people. It is clear that no government in Africa (or anywhere) can demand such enormous sacrifices from the masses of the people without setting into motion waves of resistance. In Zambia, for instance, there were food riots in the copper towns of Ndola and Kitwe in 1988 when the government, in following the restructuring exercise at the behest of the IMF, raised the price of bread putting this necessary item out of reach of the bulk of the working people, leave alone the teeming unemployed. Similar revolts (now called 'IMF revolts') are a frequent occurrence in other parts of Africa as well as in other places in the Third World.

What is the answer of African governments to these 'IMF revolts'? Obviously, the governments have very few options. They must please the IMF if they want IMF's seal of legitimacy which is a condition for procuring the capital that the IMF says these countries badly need for their capital-starved industries. On the other hand, they cannot allow anarchy in the streets and factories. The governments have to either displease the IMF or hit at the people. The threat from the IMF is organised and immediate (for all loans can be immediately stopped, as indeed happened in the case of Zambia in 1987) whereas the opposition from the people is disorganised and it manifests itself in the very long run. Therefore, governments find it easier, in the short run, to hit at the people than at the IMF.

And this is what most African governments have done. They have been forced to throw the burden of 'restructuring' on to the

masses. When the masses have revolted they have been cracked down. This has cut deep into the civil liberties of the people. The masses find that the very parliaments (or national assemblies) to which they have sent their elected representatives are endorsing the decisions of the executives (often one-man presidential executives) to adopt IMF/WB SAPs. The parliaments have thus ceased to be the organs through which to protest at the governments. So the masses have no choice but to take to the streets. Parliamentary democracy has given way to street democracy.

AFRICAN NEO-COLONIAL REGIMES IN POWER

Though the struggle for the democratic right to independence in Africa was broadly based, its outcome was not to put in power the lower classes but a section of the petty bourgeoisie—the teachers, the traders, the professionals, the educated, the 'progressive' farmers, and the emerging businessmen.

To be sure, successive regimes in independent Africa have made some changes in the political landscape, bringing in new classes or new fractions of the petty bourgeois classes, and significantly the army in many cases into positions to exercise power but these overall have not changed the economic landscape. If anything the imperialist control over the economies of Africa has increased though the forms by which this control is now exercised are no longer what they used to be in the 1960s and 1970s. Instead of direct control exercised through ownership of assets in the legal sense the control mechanisms are more varied and more subtle: management contracts, marketing deals, controls through technology and know-how, and so on.

The neo-colonial regimes which speak in the name of the people as a whole may in some cases be voted into power through duly held western-style elections, or they may have been ushered in power through military coups. The difference between the two ways of coming to power is important for African democrats: just in our view accept the first with all its weaknesses and reject the second. But what is important at this point of the discussion is that as long as the economic reality remains neo-colonial, both kinds of regimes objectively serve imperialism and the extent to which the masses win democratic rights and economic well-being can only be a result of their struggles from below.

There are, for sure, differences between one African regime and another. But, in general, recent history shows that African petty bourgeois regimes are prepared to be even more ruthless and brutal than the colonial governments they replaced. Whereas the stronger colonial powers (such as Britain and France) could afford to make concessions here and there without effecting their overall strategic and economic interests, the petty bourgeois regimes that have come to

power since independence have very little margin of manoeuvre. Why?

Because, speaking in a general way, the petty bourgeois class owns nothing. Its 'ownership' of property, such as it is, is only as a servicing arm of international corporate capital. It services imperialism while it whines for a bigger share. Since it cannot accumulate private property for capitalist reproduction on its own behalf, it accumulates personal wealth for consumption.

The petty bourgeoisie are also the most insecure class in history. They either hide behind a stronger force that protects their petty interests (as in developed countries of the West) or, if put into the seat of government (as in African countries), they try (with varying degrees of success) to monopolise all instruments of state power in their 'petty' (but dangerous) hands, as well as to control all avenues of speech, information and even of thought and ideology in their shallow, narrow and short-sighted petty bourgeois minds.

If they lose power they lose all. Members of this 'governing class' could, overnight, lose all the personal wealth they might have accumulated through ill means; they could land themselves in jail, or they could, if lucky, escape into exile, and live to fight for coming back to power, or, finally, dissolve into obscurity. The petty bourgeois dictators of the 'Third World' are a pathetic lot—you can take your pick from "Emperor" Bokassa to the 'puppet' Marcos—the range in between and at both extremes is varied and colourful.

Fearfully insecure as they are, especially when they are in the seat of power, the petty bourgeois classes show their timidity—especially when forced in a tight corner—through exercising the instruments of power with the utmost ruthlessness not only against the lower classes but also amongst one another. This explains why the incidence of violation of human rights have intensified in almost every African country barely a few years after the gaining of political independence. The Amnesty International has amply documented the continuous devaluation of human rights in Africa.

Insecurity about losing power breeds fear. Fear leads to intolerance towards all opposition whether it comes from political parties in opposition or to workers organising into independent trade unions, or students daring to challenge the sacred shibboleths of, in most cases, one-party rules. The petty bourgeoisie are really the 'emergency regimes' (i.e. those who use arbitrary and emergency regulations) left behind by colonial powers, and they use state authority with even greater crudity and lesser inhibitions. The monopoly of power that the petty bourgeoisie want to exercise does not allow for any alternative voice to appear independent of control by those in power.

The question might be raised as to whether we are not being too cynical, rashly judgmental and uncaringly sweeping in our blanket condemnation of African regimes?

Aren't there some governments better than others? Is it not too simple a generalisation to describe all regimes in Africa as 'petty bourgeois'? Haven't changes come about in the class composition of those in power over the last 20 or 30 years of independence? Have not new classes come into the process of decision-making? Haven't some old classes died away (e.g. a feudal landed gentry) giving place to new classes?

It is a hallmark of academic scholarship to create classes where none exists or where some exist only as a shadow of their former historical selves. Such is the case, for example, with the so-called 'landed oligarchy', or 'the modernising elite' or 'the reformist bourgeoisie'.

There is no so-called 'reformist bourgeoisie'—whatever that means—in Africa. If it means a bourgeoisie that aims to 'modernise' the economy to bring it more in line with contemporary western models, then such a 'bourgeoisie' does exist but it is not 'reformist' in any real sense, for whatever 'reforms' they have introduced (a 'democratic reform' here and a 'liberalised economy' there) is in order to accommodate pressure from the grassroots since their objective mission (no matter how carefully disguised) is to restructure or rearrange the political alliances to make the masses even more subservient to the rule of corporate capital. It is often forgotten that the secular movement of contemporary history is not the creation of 'national' capital (and thus of a 'national' bourgeoisie) but of centralisation of capital into the hands of ever larger and ever fewer international agencies of private corporate interests—mostly American, European and Japanese.

As for 'landed oligarchy' this one does not exist in Africa either. If it does in caricature, it is a mere shadow of its pre-colonial past long shorn of its power and glory in the service of the colonial state and the economy. The 'bourgeoisie' on land is 'landed' all right, (that is, by definition—i.e. they exist 'on land'), but it is not part of the ruling 'oligarchy'. Those on land, rich or poor, are all at the mercy of industrial and bank capital to whom they have mortgaged their land, their crops, cattle, and their lives.

Desperate scholarship has always sought to discover 'new classes' and new 'class alliances' to justify their PhDs and research grants. But all they have ended up with are 'discoveries' of new tribal affiliations in a pattern of changing alliances, or new 'fractions' of the petty bourgeoisie now in civilian attire, now military. So the only 'new' classes that have ushered themselves into the seat of decision-making are social groups belonging to the same petty bourgeois classes. These, to give but a few prominent examples, are

- (a) An increasing bureaucracy in the top echelons of the state
 - (b) A professional elite
 - (c) A military elite
 - (d) A comprador business class
- Excluded from these decision-making,

power structures have been:

- (a) A petty bourgeois 'nationalist' business class
- (b) An increasing number of unemployed college graduates
- (c) Masses of the unemployed in the rural and urban areas
- (d) The lower ranks of the military
- (e) Women (except the wives of those in power)
- (f) The poor and middle peasantry
- (g) The working classes in all sectors of the economy—agricultural, industrial and service

We have found that even the petty bourgeois nationalist business class, though a part of the independence 'accommodation' is now increasingly marginalised. The so-called 'emergent' African businessmen have remained submerged as governments and international credit institutions have tried—and failed—to lift them up from their morass of debt and extended family obligations. Unlike other parts of the Third World, the African urban propertied class was never allowed during the colonial period to develop. It was always either the Indians (as in East Africa) or the Lebanese (as in West Africa) or the whites and Indians (as in Southern Africa) who were encouraged to occupy middle positions in the transmission belts linking the African peasant, miner and worker with corporate power in Europe. So the African businessman has never really emerged as a strong economic or political force. It is the institutions of the state and the professions which hold better hopes for the African petty bourgeoisie to accumulate personal wealth rather than the world of business (barring a few exceptions here and there, of course).

Above all, the only classes which can bring about a fundamental change in the whole political and economic system—namely, the landed and industrial working classes—have not participated in policy-making anywhere in Africa. In some cases, such as in Burkina Faso under Sankara, in Ghana under Jerry Rawlings and in Uganda under Museveni, certain populist regimes claimed (or claim) to speak on behalf of the people and to have transferred decision-making powers to the 'grassroots', but a close scrutiny of these would show not only that what was transferred to the grassroots was insubstantial but also that they were used to prolong and camouflage the continuing exploitation of the peasantry and the workers by international corporate capital. In no country in Africa does the IMF fly its banners higher than in Ghana today.

If we appear to be summarily dismissing the petty bourgeois regimes in Africa, it is because, after over a generation of independence of most of Africa, there is very little to show by way of the masses enjoying even bourgeois democratic rights, and the right to a decent meal and a safe shelter.

The petty bourgeoisie are the class caught between on the one hand the big bourgeoisie (international corporate capital) and on the

other hand the working classes. They rule by scraping and bowing before the first and hitting at the second.

However, the immediate threat to petty bourgeois rule, at least in Africa, are not the working classes but other factions within their own class who are out of power and who, whilst out of power, champion the cause of free press, plurality of political parties, openness of economy and an independent judiciary and who, when in power, behave exactly in the manner of the ousted faction. So the faction that is in power shows no mercy to those of its class who wait in the wings to seize power at the first opportunity—now openly known in Africa as 'the opportunists'.

Normally, the petty bourgeoisie are loath to hold elections, but they have sometimes to accommodate grassroots pressure for an occasional confirmation of hard-won independence and loyalty to a (fragile) constitution. The ruling party then first holds a 'party congress' at which leaders are chosen 'by acclamation' and then brought to the people to be 'elected'. The key determinants of electoral victory are

- (a) Appeal for ethnic support,
- (b) A monopoly of state information apparatus,
- (c) Willingness to gerrymander the elections and to use the 'Party youth wingers', and the army, if necessary, against the opposition,
- (d) Populist slogans and
- (e) Playing on the fears and general ignorance of the population.

Practically everywhere in Africa dissent is generally not tolerated by those in power. Or at best, the limits to tolerance are very narrow. There is an extremely low threshold for tolerance of dissent, and the reasons for this we have already described above, namely, the fear to lose power, for unlike in the fully developed capitalist states, when you lose power in Africa you lose all.

Nonetheless, two kinds of dissent may be identified: (a) Critical dissent, and (b) Oppositional dissent. Critical dissent comes from those who have neither the intention nor the capacity to challenge the government or to overthrow it. Its intention is to influence the government to make reformist changes in policy or practice. Oppositional dissent, on the other hand, comes from those who would want to overthrow the government.

But the boundaries between the two, however, are not always clear. Those involved in dissent may think they are being 'helpfully or constructively critical' of the government in order to strengthen the progressive forces that there may be amongst those who hold state power, but the state may not think it that way, they may think that those who are involved in 'critical' dissent may in fact be involved in 'oppositional' dissent. Often both forms of dissent are clamped down without discrimination, leading dissent to its third form—underground and illegal dissent, or to its fourth form—dissent in exile.

How then are civil and political rights guaranteed in such a situation?

The liberal as well as social democratic bourgeois tradition has it that the civil and political rights are guaranteed by certain jealously guarded institutional means that have emerged out of long and bitter struggles of the masses against authority. These are the countervailing forces against excessive abuse of state power, and they include

- constitutional protection of these liberties,
- a free and independent press,
- a free-thinking intellectual fraternity,
- a free and independent trade union,
- multi-party system,
- an independent judiciary,
- periodical accountability to the voters through elections to the parliament, and
- a free and independent church as an interpreter of alternative morality to state's interpretation of it.

Having listed these, we must immediately caution that in times of crisis the bourgeoisie in western 'democracies' are apt to abrogate or set aside some or all of these safeguards to individual liberties and protect what is dearest to the bourgeois heart—bourgeois property. And it is not just in war times only that these safeguards are 'set aside'. Margaret Thatcher (but not she alone) has shown that these things can be done even during peace times too.

But in Africa these countervailing forces to state power as guarantors of civil liberties do not exist—or are extremely fragile where they exist in some form—and they have no solid roots in society. The colonial period made sure that whatever traditions existed in the distant past were torn into shreds and replaced by unchallenged authority. All civil rights are a gift from the state. It can give, and it can take them away. Those replicas of democratic institutions (such as the Constitution, the parliament, the independent judiciary, multi-party system, etc., etc.) which were hastily assembled on the eve of independence have not acquired civic roots to counter against a century of colonial authoritarian tradition deeply embedded in the body politic of the African state.

However, it is not true to say, as some do, that there is absolutely no 'free press' in Africa. There isn't a particular kind of free press—a press that consistently and steadfastly articulates the views of the lower classes about the nature of their oppression and exploitation, but some kind of 'free press' does exist. Theoretically, the press has two sources of power.

(a) The 'rightist' press has as its source of power a firm footing in finance capital. And it does, from time to time, hit at the excessive abuse of power by governments in Africa for fear that such abuse could have a destabilising effect on the climate of investment and profit-making.

(b) A 'leftist' press has as its source of power the barely audible voice of the weak and the disinherited. Few newspapers dare

act as their spokesmen, and so a few intellectuals of left inclination bring out periodicals and journals which are tolerated by the state because these periodicals are generally dismissed as being 'academic' or 'intellectualist'. They generally have a limited circulation, and pose no real threat to those in power, although, of course, the state will clamp down on such journals if they go beyond a certain threshold of tolerance.

The rightist press is found in every African state, often owned and financed from outside, and usually championing the cause of 'free enterprise' whilst condoning every instance of crackdown on the working classes daring to ask for a fair return to labour or, failing that, daring to withdraw their labour in 'illegal' strikes.

In most developed countries in the West it is the working classes and left intellectuals who form the backbone of the opposition to the ruling capitalist oligarchies. In Africa, the left intellectuals are weak and divided. Often they have mortgaged their integrity to official 'Marxist-Leninist' or 'socialist' parties in the vain hope that they would "influence the state from within". Some of them are engaged in the universities or in the media, and play an important role in the conscientisation of the broad masses of the students and the working classes, but their impact as yet in Africa (compared for instance, to Latin America and the Far East) is still marginal.

As for the working classes and the trade unions, they too are generally weak and divided. Many of the unions and confederations of unions in Africa are ideologically confused as a result of massive infusion of American trade-unionist and European social democratic finance, literature and 'workshops' that aim at depoliticising the working class struggles. As for governments that claim to be 'socialist' or 'Marxist-Leninist', they attempt to put the unions under the umbrella of the ruling parties on the alleged grounds that the workers are their allies in ushering in the socialist millennium. However, whatever the political or ideological hue of the government in power, labour strikes in Africa are generally difficult, either made illegal by law or made impossible by administrative encumbrances. The 'free' enterprise belongs to the arena of free withdrawal of capital if there is inadequate profit, not to the arena of free withdrawal of labour-power if there is not a fair return to labour.

Thus the trade unions, the students, the leftist press, the independent judiciary, etc. are recognised either in their obscurity or in their utter passivity.

Only three 'institutions' have retained varying degrees of independence in post-independence Africa: One, the churches² because of their international connection, although they too are under pressure to conform; two, the army, itself part of the instrument of oppression but often able to stand aside from the 'governing' elite and threatening to take power for themselves; and three,

local agents of international financial corporate power, which we have discussed earlier. However, all these three have shown in practice that they scream to high heaven in protest against governments only when their own narrow interests or narrowly conceived value systems are threatened, and they join authoritarian forces to clamp down on the working classes and radical intelligentsia (sometimes justified as fighting 'communism') whenever the ownership of property of the big bourgeoisie is threatened.

NEW AGENDA OF DEBATE

Reality is fastidious. It confounds the best theoretician. The debates of the 1970s and the 1980s on the question of democracy and development have already been outpaced by events. The most destructive of past theories and past illusions have been the changes in the Soviet Union and the Eastern European countries. These events have destroyed, once and for all, the myth that socialism can be achieved from on top by an intellectual vanguard seizing state power at the behest and on behalf of the workers.

The second reality is the failure of all the strategies offered to Africa by Harvard-or-Sussex-trained so-called 'experts in development theories' who thought they had the answers to Africa's problems in their word-processors. These foreign and foreign-trained experts simplify African reality and turn it into an economic abstraction. In September 1990, Adebayo Adedeji, the Executive Director of the Economic Commission for Africa, himself a well known economist and also trained in the West, finally came down to state the truth that conventional economists have misled Africa for the last three decades. The theories of the western economists have failed, and so, as we have seen, the practices of world institutions such as the World Bank and the IMF who speak on behalf of international corporate capital.

These events have cleared the decks of the reigning theories on development and democracy banded about Africa for the last thirty years. In the mid-to-late 1980s the concerns of the dominant ideologists have shifted thrice. The first shift came around 1986-87, when the World Bank ideologists finally acknowledged that the social cost of the Structural Adjustment Programmes (SAP) was very high, and that something had to be done to mitigate its effects. The second shift came a couple of years later when the WB and many other donor agencies decided that the so-called non-governmental organisations (NGOs) might be better agencies through which to channel aid than the central government agencies, though, of course, the latter could not be ignored. And the third shift came with the appearance in 1989 of the World Bank's Study, *Sub-Saharan Africa: From Crisis to Sustainable Growth*, which, for the first time, put the political aspects of 'governance' on the agenda of the World Bank in addition to its con-

ventional economic agenda.

Our earlier quote from the UNICEF Study *Adjustment with a Human Face* talks of the high 'social cost' of the Structural Adjustment Programme. Normally, of course, capitalism is not concerned about 'social costs' of profit maximisation, but in the mid-1980s it did look as if the masses in Africa were abandoning parliamentary methods of protest and taking to the streets. Something therefore had to be done to pacify this groundswell of political opposition. Hence was born the idea of 'adjustment with a human face'. Let the World Bank speak for itself:

The Bank seeks to assist governments in identifying ways and means of mitigating adjustment costs and to modify the design of the policy and institutional measures accordingly. During the implementation of the adjustment programme, the government and the Bank need to monitor closely any negative impact of the programme on the most vulnerable sections of the population and help to develop compensatory programmes, targeted on the affected groups as required³ (emphasis added).

So the task of masking the ugly face of adjustment became an urgent agenda for corporate capital expressing itself through the World Bank.

The first major experiment at this 'masking' was undertaken in Ghana. According to WB's own reports, since the adoption of the WB-induced Economic Recovery Programme, about 75 per cent of all households in Ghana dipped below the poverty line, and the death rate had risen dramatically. Ghana's Finance Minister, Kwesi Botchwey, warned at the New York meeting of the IMF that no recovery programme could succeed if it pushed a long-suffering people into rebellion. It was to forestall such a possibility that the Ghana government, at the behest of the IMF/WB, introduced the Programme of Actions to Mitigate the Social Costs of Adjustment (PAMSCAD). PAMSCAD instituted four sets of measures. First, food-for-work jobs, mainly for the urban poor; second, more credit for small-scale farmers and miners and to concerns that employ women; third, special funds to community self-help projects that "create employment and address the needs of vulnerable groups"; and finally, a 'basic needs' strategy through financing projects in water, sanitation, health care, nutrition and housing. Immediately Ghana introduced PAMSCAD, it received pledges of US\$ 85 million (\$1 million more than it asked for) from a variety of western donors and UN agencies.

Whilst the WB was celebrating the 'success' of PAMSCAD and considering introducing similar measures in other parts of hard-pressed Africa, things continued to deteriorate in Ghana. In an interview with the BBC, Adebayo Adedeji spoke against adopting the Ghana model. "You can take each of the indices in the social sector, one by one", Adedeji said, "and compare Ghana of today with Ghana of 20 years ago. It is

but a shadow of what it used to be." This was echoed in early 1990 when Jerry Rawlings, at the aid consortium meeting in Paris, expressed his disillusionment with PAMSCAD.

That more or less killed PAMSCAD in Ghana, but not yet WB's attempt to try the same experiment out in another country in Africa, and the country chosen was Uganda. In 1988, once again at the behest of the WB, the Uganda government introduced the Programme for the Alleviation of Poverty and the Social Costs of Adjustment (PAPSCA). What made Uganda attractive was the acclaimed success of its 'Resistance Council System'. The system was born during the guerrilla days of the present ruling party in Uganda when it was fighting against the rule of Milton Obote. This, the RC system, introduced a hierarchical structure of decision making from the village level onwards to higher levels. What was attractive about the system was its promise of 'direct democracy' at the village level. Here, finally, it was said, was the answer to creating a development organ that went down directly to the grass roots and was accountable to the people. Of course, this experiment is going to be as illusory as the Ghanaian one.

The Uganda project fitted neatly into the second shift in the World Bank strategy—the idea of channelling aid through the NGOs. In a 1990 publication called *How the World Bank Works with Non Governmental Organisations*, the Bank explained thus:

Over the last generation there has been significant worldwide growth of NGOs, and their capacity to contribute to the development process has expanded. Meanwhile there is growing recognition worldwide that the public sector is limited in what it can do. As societies come to terms with these limitations, many look to citizens' organisations and non profit groups to assume a greater role.⁵

The emphasis on 'citizens' organisations' coincided with changes in Eastern Europe where too civic associations took the lead in challenging the domination of the old state apparatus. So it seemed a good idea to use grassroots civic organisations to channel aid to African countries where, above all, the public sector corporations were fast losing their credibility and coming under a massive attack from the WB and donor agencies for their inefficiencies.

The third shift in the World Bank's strategy came around 1989 when the Bank squarely faced what it called the problem of 'governance' and of accountability of African governments to their populations. The 'Crisis to Sustainable Growth' document of the WB, after having laid out some of the economic measures of 'structural adjustment' and measures to improve the management necessary to improve the delivery system, goes on to add:

None of these measures will go far nor will much external aid be forthcoming, unless governance in Africa improves. Leaders must become more accountable to their peoples. Transactions must become more transparent, and funds must be seen to be properly ad-

ministered, with audit reports made public and procurement procedures overhauled.⁶

The WB's demand for 'good governance' and 'accountability' had since been echoed by many bilateral donor agencies, some of whom, like Britain, have come out openly to accuse African governments of corruption and mismanagement.

All that is left now for us is to explain this latest turn of events where you have the odd spectacle of the World Bank the arch exploiter of African labour, preaching democracy.

PARADOX OF DEMOCRACY

We argued earlier that democracy and development are never 'given' as 'concessions' by the ruling oligarchies. These are always fruits of victories won by the people engaged in intense struggle against these oligarchies. What has happened in Africa is that the people at the grassroots level are becoming increasingly conscious politically. They had fought for independence but they have now realised that political independence from colonialism was only partial victory, for whilst it created some political space for them to exercise their right to vote, long denied them under pretext that Africans were not 'civilised' enough to qualify for the vote, the post independence era, if anything, has tightened the noose of neo colonialism even more securely round their throats.

African governments have few options. As a class they have no property. As individuals incapable of accumulating private capital they can only indulge in personal consumption. Above all, they have very little leverage against the dictates of international finance capital at whose behest they 'make policies' for economic 'development', now based on 'import substitution', now on 'export promotion'—in an endless cycle of illusions. All the time, however, international corporate capital continues to declare massive profits in their annual reports. Part of these profits go into the extraordinary (and, one might add, foolish) forms of consumption of the people in the West, which 'dirty habit' is now beginning to take its toll on the forests of Europe and the ozone layer. However, apart from their worries about the ozone layer and (until the Gorbachev turnaround) the possibility of nuclear war, the populations in the West are almost completely depoliticised, and their concerns for the poverty in the Third World is spasmodic and constitute an irritant to be removed from their TV screens by occasional handouts of 'relief' to the destitute or, to use the WB vocabulary, the 'vulnerables' of Africa.

Naturally, the bulk of African masses get no relief from these measures. Instead, over the years the standard of living of the masses of African people has declined. The economic immiserisation of the African population, caused by the intensification of exploitation by corporate capital, is at the root cause of the spate of civil wars and internecine violence in Africa, presented in the Western

media as expressions of 'tribalism'.

In sheer desperation, African masses have taken to the streets. As we said earlier, the parliaments in Africa do not provide adequate organs for protest against governments' policies, for these policies in any case are not made in Nairobi, Lusaka, Accra or Dakar but in Washington, London, Bonn, Paris and Japan. So in which arena do the African masses fight for their democracy? Naturally, in the streets of their capital cities and in the mining towns.

The paradox of 'democracy' is that every slave master eventually turns his whip against the slave supervisors for allowing things to deteriorate so badly that the slaves are in revolt. This is what the World Bank and the donor agencies are now doing with African governments. Their call for 'accountability' and 'good governance' is but a call for the governments in Africa to discipline themselves, not to be self indulgent, and to begin to listen to the reasons why the slaves are revolting and to make sure that things do not seriously deteriorate so badly that there is a groundswell of revolutionary upsurge from below throwing the whole edifice of the present international system into jeopardy. We started out by describing the demise of extant democratic models in Africa—both of the left and of the right. We suggested that this was a positive development since for the first time since African countries became independent, there are no models of democracy to emulate and so African masses can begin to think for themselves. We argued, however, that this was not going to be easy because there are powerful global and local interests in Africa who are simply not interested in democracy or to give it a more current description: empowerment of the people.

Democracy, however, cannot be separated from economics. The demands by the grass roots for democracy have arisen out of the increasing immiserisation of the masses of African populations. The masses have realised that the solution to their low wages and low crop prices does not lie in economics alone. The task before them is essentially political. The politics of struggle against the present international system has arisen from the economics of the system, but the remedy for the crisis does not lie in economics alone. What the world economic crisis has brought to the fore is the politics of struggle by the oppressed and exploited classes against those the financial oligarchy who own and or control the means for the exploitation of the world's productive resources for exclusive consumption by a very tiny percentage of the world's population.

The first concrete step to the dismantling of this system is thus the further extension of the democratic rights of the people of the Third World beyond the formal act of political independence. Of course, these democratic rights are not likely to be defended and made effective by those who wield social power in the Third World countries. These classes have acquired a vested interest

in not rocking the boat, which is why reformist solutions presented by such as Willy Brandt and social democrats are so appealing to them. They cringe from mass politics, and clutch on to these reformist solutions even when these have demonstrably failed to 'reform' the system. What this means therefore is that the struggle to exercise the right to democratic freedom must also be spearheaded by the working classes themselves, just as they spearhead the struggle for a fair return to their labour in the sphere of production.

The bulk of the producing classes in Africa are peasants, and a vast majority of these are poor, even destitute. The politics of land is therefore the politics of those who labour on land for the control of cattle, of water, of cultivable land, of the forests, the fish, the air and, above all, for the control of the institutions that make decisions. The peasants are daily crushed by the demands of corporate capital (in the form of hybrid seeds, fertilisers, pesticides, tractors, rising diesel prices, state credit and state marketing boards) and all the intermediate classes that benefit from this form of exploitation. In one study we carried out in the Zambezi Valley in Zimbabwe we found that less than 10 per cent of the value produced by the peasants in the Valley is retained in the Valley for the benefit of the people; over 90 per cent seeps out in the form of expenditure on inputs, repairs, and maintenance, transport costs and interest on borrowed capital. We also found that all the main resources in the Valley—fish, forest and wildlife—are commercialised as concessions in the hands of big companies, whilst the peasants themselves are prevented, by law, from using these resources. They have to subsist by producing cotton and maize—neither of them indigenous to the area.

Where there is oppression, however, there is also opposition. The peasants in the Valley that we know, as indeed peasants everywhere in Africa, are waging a war of survival and resistance. It takes many forms. At the economic level, the peasants 'cheat' the state and the marketing boards; they cheat the laws that prevent them from hunting and fishing; they collaborate with lower level state officials who are closer to them on the ground to undermine the dictates of higher level desk-bound autocrats, who, since they never leave their desks, do not know what is happening on the ground. People have to survive first. Then they can organise themselves. They use traditional institutions—such as spirit mediums—in order to legitimise their acts of defiance (subtle, not open defiance) against state authority. They illegitimise certain agricultural practices imposed upon them as 'taboos'—as has happened in some areas against the practice of using fertilisers. They use traditional medicine and, in some cases witchcraft, to cure illnesses, 90 per cent of which, in any case, are either psychosomatic or socio-somatic, incurable by western medicine. Hence the peasants are on the one hand

'modernising' under pressure from the state and on the other hand 'traditionalising' their strategies to gain control over their resources and decision-making structures.

Of course, it would be wrong to romanticise the struggles of the peasants, and it would be wrong to separate their struggles from those of the workers in factories. In another study of five industrial trade unions in Zimbabwe we have found that the dichotomy between 'workers' and 'peasants' is a false dichotomy—a theme we cannot get into here.

The point is that certain clever agents of the World Bank and corporate capital have done research into the rural areas of Africa, and have discovered the new social forces that are emerging on the ground. They may yet not be formidable. They are as yet isolated and unorganised. And yet, who can say, in a global movement of awakening of oppressed peoples everywhere, from the ethnic minorities in Europe to the indigenous peoples of America and Canada, and the forest peoples of Africa, Asia, Brazil and Australasia, there may yet be a new social movement gathering force at the grassroots level. It is not without reason that

the World Bank is increasingly focusing on the 'grassroots' so-called 'non-governmental organisations'. That is the terrain of battle for the 1990s. That is where the struggles for democracy and human rights are being daily waged... and, we are witness to some that have been won, even if, for the time being, ephemerally. That process has still to be recorded.

APOLLO TYRES LTD.

CORRIGENDUM

Further to our corrigendum dated 14.3.91 under sub-section (4) of section 23 of the Monopolies and Restrictive Trade Practices Act, 1969 for approval to take over the whole or part of Gujarat Perstorp Elektronik Ltd published in the News papers the following changes may be noted.

| 1. (iv) Capital structure of | Share Capital | Authorised (Rs.) | Issued Subscribed & Paid up (Rs.) |
|--|--|------------------|-----------------------------------|
| b) the undertaking proposed to be taken over | Equity Shares of Rs.10/- each | 100 Lacs | 70 |
| | Initial paid-up Equity Share Capital shall be Rs.940 lacs. Apollo Tyres Ltd. proposes to acquire 45,59,000 Equity Shares of Rs.10/- each amounting to Rs.455.9 lacs. | | |
| (vi) Consideration for the take over | Rs.455.9 lacs by subscribing 45,59,000 Equity Shares of Rs. 10/- each. | | |

Dated this 18th day of June 1991

For APOLLO TYRES LTD,
(PN WAHAL)
COMPANY SECRETARY

Regd Office 6th Floor, Cherupushpam Building, Shanmugham Road,

NOTES AND SCHEDULES TO FINANCIAL STATEMENTS AS AT MARCH 31, 1991

1 Principal accounting policies

(a) General

The accompanying financial statements have been prepared on the historical cost basis and conform to the statutory provisions and practices prevailing in the country

(b) Transactions involving foreign exchange

Monetary assets and liabilities have been translated at the exchange rates ruling at the close of the year

Income and expenditure items have been translated at the exchange rates ruling at the date of the transaction

Profit or loss on outstanding forward contracts have been accounted on an accrual basis

(c) Investments

Investments are valued at the lower of cost or market value

(d) Advances

Provisions for doubtful advances have been made to the satisfaction of the auditors. The provision has been made based on management's estimates of potential exposure and taking into account guidelines issued by the Government of India and the Reserve Bank of India

Advances are shown net of Bills Rediscounted under the New Bill Market Scheme of the Reserve Bank of India

(e) Fixed assets

Fixed assets have been accounted at their historical cost

Depreciation has been provided on the straight line method at the following rates per annum:

| | |
|-----------------|-----|
| Furniture | 10% |
| Vehicles | 20% |
| Computers | 25% |
| Other equipment | 20% |

(f) Staff benefits

The Bank has entered into an Employees Group Superannuation Scheme with Life Insurance Corporation of India (LIC) for providing pension benefits to employees. The Bank also makes a provision for any additional liability not covered by the LIC Scheme

(g) Taxation

The balance of profit disclosed in the Profit and Loss Account is after provision for taxes on income in accordance with statutory requirements

CREDIT LYONNAIS

2 Schedule of Particulars of Advances required by the Banking Regulation Act, 1949

| March 31 1990 | PARTICULARS | March 31 1991 | | | |
|------------------|--|------------------|--------------|--|----------------|
| 27 378 436 60 | (i) Debts considered good in respect of which the Banking Company is fully secured | 8 716 13 98 | | (v) Debts due by the directors or officers of the Banking Company or any of them either severally or jointly with any other persons | 8 089 930 41 |
| 15 310 836 18 | (ii) Debts considered good for which the Banking Company holds no other security than the debtor's personal security | 714 3 953 | 1 304 882 60 | (vi) Debts due by companies or firms in which the directors of the Banking Company are interested as directors, partners or managing agents or in the case of private companies as members | Nil |
| 161 117 369 82 | (iii) Debts considered good secured by the personal liability of one or more parties in addition to the personal security of the debtors | 2 35 886 730 62 | Nil | (vii) Maximum total amount of advances including temporary advances made at any time during the year to directors or managers or officers of the Banking Company or any of them either severally or jointly with any other persons | 8 349 477 84 |
| Nil | (iv) Debts considered doubtful or bad not provided for | Nil | 1 304 882 60 | (viii) Maximum total amount of advances including temporary advances granted during the year to the companies or firms in which the directors of the Banking Company are interested as directors, partners or managing agents or in the case of private companies as members | Nil |
| 201 826 635 61 | Total advances | 25 446 334 4 | 143 98 195 | (ix) Due from Banking Companies | 487 224 453 82 |

3 Remuneration paid to the Chief Executive Officer in India

| March 31 1990 | March 31 1991 |
|---------------------------------------|------------------|
| Salary to the Chief Executive Officer | 496 603 |
| Perquisite and other allowances | 85 69 |
| Total | 581 29 |

4 Prior year comparatives

Figures in prior year are for the period from March 23 1989 to March 31 1990

Auditors' Report on the Financial Statements under Section 30 of the Banking Regulation Act, 1949

We have examined the balance sheet of the Bombay Branch of Credit Lyonnais (incorporated in France with limited liability) as at March 31, 1991 and the related profit and loss account for the year then ended. Our examination was made in accordance with generally accepted auditing standards and accordingly included such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances. We have also obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our examination and have found them to be satisfactory.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949 and the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of the Companies Act, 1956, the financial statements are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act, 1956. The financial statements are therefore drawn up in conformity with Forms A and B of the Third Schedule to the Banking Regulation Act, 1949.

In our opinion, the accompanying financial statements give a true and fair view of the state of affairs of the Bombay Branch of Credit Lyonnais at March 31, 1991 and of its profit for the year then ended.

Furthermore, in our opinion:

- the transactions of the Bombay Branch which have come to our notice have been within the powers of the Bombay Branch of the Bank,
- the balance sheet and the profit and loss account are in agreement with the books of account and give the information required by the Companies Act, 1956 in the manner so required for banking companies; and
- the Bombay Branch has maintained proper books of account as required by law insofar as appears from our examination of those books.

From 'DEFENDUS' to Consensus

Jyoti K Parikh

A DEVELOPMENT focused End-Use Oriented Electricity Scenario for Karnataka published recently^{1,2} offers three major suggestions, viz, (a) Integrating energy conservation options in supply planning, (b) Consideration of decentralised energy options with 26,000 rural energy centres, and (c) Development focus while giving electricity connections

Are these suggestions viable? Is it possible to ensure co operation of the consumers or is the government required to intervene making for an even bigger government than now? Are the claims of saving 60 per cent of investment costs credible? This note comments on the first two abovementioned suggestions made in the article

Many of us non government organisation (NGO) professionals are unanimous about the need for integrating the demand side management (DSM) options into supply planning. DSM is a general term which includes conservation as one of the measures. Least cost planning approach has been around for a decade in the West, but has not yet been formulated for India. Therefore, the development focused end-use (DEFENDUS) approach is timely. However, is it ready for implementation in the Indian conditions? In answering this, the following conceptual, factual and institutional points are relevant

LEAST COST PLANNING

The least cost planning approach in the Indian context involves three (or four) actors—utility (existing plants) consumers, Central and State governments (new plants). DEFENDUS does not distinguish whose costs are being minimised. Mixing these costs may give unrealistic and unimplementable results for several reasons.

Typically, a consumer uses a much higher discount rate (18 per cent to 40 per cent) than a utility does (15 per cent). Central and State governments may decide to take other discount rates depending upon the aid, loan or other finances raised, but generally 10 per cent to 12 per cent. The investment comparison is made by the consumers not on the basis of what it costs the utility to invest in new plants, but what they save in electricity and demand charges and whether the savings pay back for the investment in retrofits at reasonably high discount rates (ranging from 20 per cent and up). No doubt, if consumers do not find it worthwhile, the government can finance them rather than the utility. But these calculations imposing an additional burden have to be accounted for.

The loan offers of Industrial Development Bank of India (IDBI) for conservation measures have not been taken up by the industries, partly because they add to their

liabilities, which does not impress their shareholders and reduces their borrowing ability.

It is for this reason, that DSM technologies are different than DSM programmes. The Indira Gandhi Institute of Development Research (IGIDR) is currently working on this. In a *consensus approach* a set of technologies should be put before the industries so that *their* ideas of least cost curve and the expected costs and benefits can be obtained.

In the West, there is two-actor negotiations. We have a three-actor problem, where the government is the third actor making it difficult to arrive at bilateral solutions practised in the West, where the utilities finance DSM projects. First of all, in India, utilities do not have any legal obligations to consumers to provide 'interruptions-free' electricity. Secondly, their pricing policy is politicised and dictated by consumer groups and politicians. Thirdly, on the other hand, the utilities do not have to raise much of the resources internally for investment in future plants. This makes it difficult to get the utilities interested in the DSM options because simplistically "they have no responsibilities to consumers and the investment for new plants is also not their responsibility". Therefore, in the 'four actor' situations, (when one includes State government and Central government as separate actors) it is the government that may have to negotiate directly and bilaterally with consumers, however, with the price that is set by the utilities. This is the institutional set up we have to keep in mind for the DSM. The best strategy will be to implement promotional (and punitive) policies where the consumers participate at their own will and do not expect the government to invest. A larger government role will eventually defeat the original purpose of DSM.

IGIDR has carried out an extensive survey of High Tension (HT) industries.³ In addition to differential discount rates and price considerations, the consumers also compare the efforts for conservation and DSM with other preoccupations they have, such as inventory management, reduction in delivery time, increasing capacity utilisation and so on, many of them also have just a much potential for cost savings as energy management. In response to our question "how much load will you shift for 30 per cent cheaper electricity at off-peak times", most of them said none! What could explain this partially is that the 'lost-plus' nature of pricing of outputs prevents them from taking cost saving measures.

As far as discouraging power intensive industries like aluminium is concerned,

especially on employment consideration, we have to bear in mind that such discretion does not lie with utilities in India (or perhaps anywhere) if the industry is willing to pay the price. Moreover, aluminium is a commodity required by poor or middle class in their households for cooking and construction and much of it is used by the power industry itself. So who is to manufacture it? In a centrally planned economy, it is the government which can take a decision whether it is worth importing it.

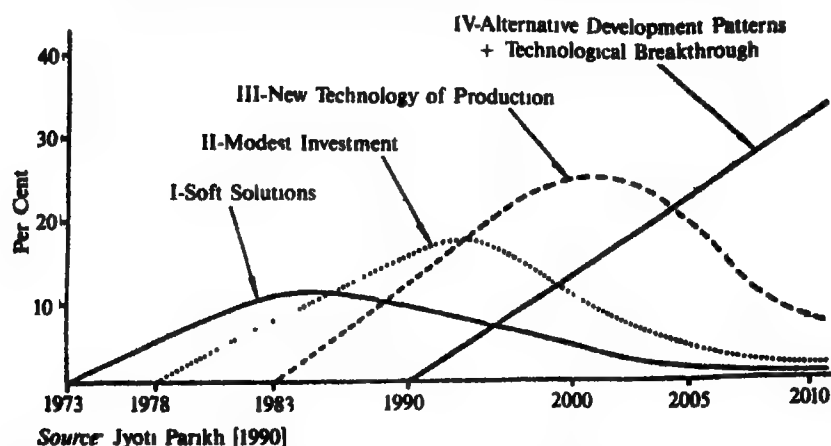

DEFENDUS would have to be less technocratic, working on dictates of energy efficiency, no matter, howsoever benevolent. It works on the same principles as the conventional system, namely implementation of a set of technologies. Such a concept like the DSM needs innovative ideas of management which are more participative. Consumers must have stake in the measures. For example, four major types of changes are already to be seen in the economy.⁴ All of these need to be encouraged, viz, (i) Soft (or managerial) solutions requiring no investment, (ii) Modest investment solutions requiring retrofits in the existing plant and equipment, (iii) New Technologies of production, (iv) Alternative way-of-life and societal change.

We will have to reckon with some energy inefficiencies in the system as trade-offs with other resources such as time, investment, water (irrigation), other inputs and so on which are always necessary to achieve overall production efficiency. For example, do we (or the authors of DEFENDUS) ride buses and trains because they are energy saving compared to cars and planes? If not, then why cannot the industries also be given a range of energy efficiency within which to operate? No doubt, energy audits must be compulsory for consumers beyond 2 MW load per connection, in view of national needs. However, having done that, the ultimate goals should be to lead to overall efficiency, while giving them a range options to choose from. It need not be a case of either motors or compact fluorescent lamps (CFL).

TECHNOLOGY FOCUS: MOTORS AND CFL

Narrow technocratic interpretation of end-use is taken here, instead of taking ultimate goal oriented end-use focus. For example, improvement in motors may not be possible, once the equipment is already installed. The best way to ensure this, is directly at the motor manufacturing plants. After that, one has to go in for overall process optimisation. For example, optimisation of cooling system will lead to more energy savings than changing motors in the air-conditioning plant. Often, it could have more to do with reducing leakages and improving cooling system design than changing motors. The same holds for heating systems, ventila-

FIGURE: SCHEMATIC REPRESENTATION OF DYNAMICS OF DIFFERENT DSM MEASURES, EXTENT OF THEIR CONTRIBUTIONS OVER TIME HORIZON

tion systems, crushing operations and so on. Giving them a freedom of choice will lead to more least cost strategies. This requires promotional policies and not 'technology fixes'.

The overall options for lighting systems may be considered. Why is CFL technology promoted before even trials are made in India? The CFL lamp (we have one in our house, purchased in UK) does not give light of uniform intensity in India. It could be that the manufacturing requires better quality control and frequency fluctuations may affect it more seriously than ordinary lamps. A \$ 15 lamp, if imported could cost Rs 600

unless duty (100 per cent) is waived. Therefore, unless the lamps are manufactured in India, imports of these lamps for households could hardly be justified. It appears far fetched to assume before successful trials of CFL that factories will be set up and lamps will be available in required quantities (But no harm in considering it a possible scenario). What is wrong with good old tubelights which are at least made in India and achieve considerable energy savings, if electronic ballasts and capacitors are provided. It could easily compete with CFL in India for some portions of the market. The portion needs to be determined from appro-

prate surveys.

Decentralised energy sources should be viewed also as supply technologies minus the transmission and distribution costs. The figures 19 and 20 giving unit costs of energy and power for energy efficiency centralised and decentralised energy schemes are valuable. What we also need are factors that determine upper limits for the contributions from each of the options. Though here, subjective judgment may enter. However, in the words of a CEA official "They neither provide power nor energy" needs some thought. Micro-hydel that we examined in Kerala gave power only during the rainy season, when the reservoirs were overflowing anyway.

Some of the renewable sources need to include storage, (especially those which do not use fuel)—such as solar and wind. They are subject to daily and hourly fluctuations and not available when needed. For example, watering at early mornings (no sun then) minimises evaporation losses and reduces water requirements. Every percentage point on loss of reliability has to be accounted for and costed. Alternatively, unreliable supply could be matched with demand where reliability has no premium such as windmills with overhead tanks. The efforts and costs of financing and maintaining some 26 000 decentralised rural energy centres appears not to have been given sufficient thought. It could be sizeable. However, in view of '100 per cent rural electrification' it may be worthwhile to consider renewables feeding the grid. More homework is needed for this.

CHART TYPES OF DEMAND SIDE MEASURES AND THEIR IMPLICATIONS

| Types of Conservation Efforts | Necessary Measures | Economic Criteria | Indicative Values of Possible Energy Savings (Per Cent) | Timeframe* |
|---|---|--|---|--|
| I Soft solutions zero or negligible investment | <ul style="list-style-type: none"> Turning off lights Guarding leakages Better understanding Vigilant management Education and co operation of labour | Justified at any price | 1 to 15 | Immediate from 1973 up to 1995 till the life of old machines |
| II Modest investment | <ul style="list-style-type: none"> Replacement of spare parts Updated boilers furnaces, motors Introduction of checking procedures | Savings of energy costs should cover investment at certain interest | Modest energy savings 10 to 30 | Gradual after 1976 onwards till the life time of current technology say 2010 |
| III Alternative process or technology of production | <ul style="list-style-type: none"> For newly set up industries of all types Large industries with large savings have already done R and D | The same as above (and below) New process and machines may not be more expensive than old, e.g. mainframe vs minicomputers | 20 to 50 | Begins in early eighties, could go on past 2010 |
| IV Different structural and technological breakthroughs | <ul style="list-style-type: none"> Replacing old way of life with Substitution of energy intensive materials such as steel, aluminium, Solar and other renewables Superconductors | Some of these changes are done for other purposes but the end result is reduced energy use | 30 to 80 | Also early eighties Would go on continuously |

Note: Role of microprocessors is all pervasive and could enhance the effect of the last three measures considerably.

* As shown by the experience of the developed countries

CASH FLOWS AND INVESTMENTS

Let us imagine a situation, where planning is actually done using DEFENDUS. Can such a system survive financially, despite being 'least cost'? With millions of households and agriculture consumers added, the share of consumption from well-paying consumers (viz industries) considerably reduced, the system load factor and revenue collection will be low in comparison to the costs, to get the required financial returns. It is seen from a number of examples, that SEB's profitability declines sharply when the shares of industrial and commercial consumption go down. It is unlikely that decentralised systems can be financed by households and agriculture without major price-hikes. DEFENDUS does recommend these price-hikes but the uproar that will emerge from such price-hike has to be reckoned with. Remember, they do not have connections at present because they cannot pay for it.

The investment requirements for DEFENDUS scenario are shown to be a third of other projections. The differences look exaggerated because of the absurdity⁴ of the other projections which have institutional origin. Inherent suggestions made by the DEFENDUS can be correctly compared by the authors themselves by comparing with or 'without' certain options. Any other comparisons cannot be taken seriously and do not do justice to the work put in by DEFENDUS. When all constraints are considered, it is doubtful that DSM options will save more than 5 per cent to 10 per cent investment costs. However, this should not be considered small. We have to think of nuclear and renewable options which have not contributed to this extent despite several decades of efforts. In addition, they will save fuel costs and corresponding environmental costs which is also very important.

A word about environmental priorities. The environmental gains from DEFENDUS should have been better expressed in terms of local pollutants such as fly ash, SO₂, NO_x as well as other effects such as radiation, submergence and so on rather than global pollutant like CO₂. Not many of us agree with the idea of imposing carbon tax on ourselves to solve the problems created by developed countries.

The departure from the conventional thinking is a major contribution of the DEFENDUS. How to make DEFENDUS a participative model is a challenge for the authors. It requires a management focus (see annexure 1) rather than a technology focus. A number of suggestions such as improvements in motors, use of CFL, decentralised energy sources and so on would require a very different kind of financing, management and promotional efforts and participation of consumers of a mix of decentralised systems where household and agriculture connections are increased dramatically, needs to be established in terms of cash flow from each consumer category. Prior to implementation, the financial viability of all

the suggestions made, requires careful analysis. One hopes that the authors of DEFENDUS would come up with more innovative options encouraging participation from the consumers and ensure the financial viability of their suggestions in a comprehensive way and in a long-term sense and not in terms of investment alone.

ANNEXURE: MANAGEMENT FOCUS— A CONCEPTUAL FRAMEWORK

Energy conservation activities could be grouped into four different categories. They take different amounts of lead time to be effective, resulting in varying degrees of energy savings and requiring different levels of investments. The chart indicates the lead times, extent and periods of effectiveness. These are based on the experience of the developed countries in energy conservation. The former two types concern the existing plants and equipment and the latter two new plants and equipment (figure). To the extent that energy conservation takes place through technical progress that is embodied in new capital, savings of type III and IV may be realised only when the new investments are made. But in a developing country like India, with more than 8 per cent industrial growth rate, this happens on a significant scale. The cumulative energy savings would be due to contributions from all the four measures in which the first two measures pertaining to existing industries dominate for the first 10 to 20 years the latter two subse-

quently. The share of each of the measures in a given country at a given time will not be easy to differentiate since all of them take place at the same time.

Notes

- 1 Amulya Kumar N Reddy, Gladys D Sumithra, P Balachandra, Antonette D'Sa, 'A Development-Focused End-Use-Oriented Electricity Scenario for Karnataka' in *Economic and Political Weekly*, Vol XXVI, No 14, April 6, 1991, pp 891-910.
- 2 Amulya Kumar N Reddy, Gladys D Sumithra, P Balachandra, Antonette D'Sa, 'A Development-Focused End-Use-Oriented Electricity Scenario for Karnataka' in *Economic and Political Weekly*, Vol XXVI, No 15, April 13, 1991, pp 983-1001.
- 3 Jyoti Parikh, S Modak, S O Deshmukh, C B Kagalkar, *IGIDR-HT Industries Survey in Maharashtra*, Discussion Paper No 43, January 1991, IGIDR, Goregaon (E), Bombay 400 065.
- 4 Jyoti Parikh, 'Energy Conservation in Indian Manufacturing Industries', *Journal of Productivity*, Vol 30, No 4, 1990, Reprint No 13, 1990, IGIDR, Goregaon (East), Bombay 400 065.
- 5 These inflated projections have institutional origin because these projections are further cut by the CEA, then by the ministry of energy, at the State and the Centre and then by the Planning Commission, not once, but several times. Arbitrary cushions are provided for these anticipated cuts. It is unfortunate that such meaningless exercises are carried out wasting everyone's time.

A little planning, a lot of love...
and even with small savings
your child can be
a lakhpati by 21!

**Invest in Unit Trust's
Children's Gift
Growth Fund**

Today, he's a little baby in your arms. Your presence is all he needs to feel safe and secure. But all too soon, tomorrow will be here. And he'll be stepping out into the world. Facing the harsh realities of life.

Why not plan your child's future now? Invest in Unit Trust's Children's Gift Growth Fund. Under this plan, with small investments made over a period of time, your child can be a lakhpati by the time he's 21.

Q. How should you invest to make your child a lakhpati?

A. If you invest in CGGF at the child's birth, here are some of the many options. (i) You can invest Rs. 1,100 at birth and then every year till the child is 15 years. (ii) You can invest Rs. 3,200 for 3 successive years or Rs. 1,900 for 6 successive years. (iii) You can invest Rs. 8,500 once and for all.

Q. Suppose the child is older?

A. There are plans for every age up to 15. The CGGF brochure has charts that explain it all. Please write in for it.

Q. Who can gift it to the child?

A. Parents, relatives, friends, companies or corporate bodies

Q. What is the minimum amount you can invest?

A. Rs. 500 and thereafter in multiples of Rs. 100.

Q. What are the returns on the investment?

A. 12.5% per annum plus a bonus dividend every 5 years

Q. Is there any facility after maturity?

A. Instead of withdrawing the amount, the child can put it in any other scheme of UTI available at that time

For free literature on CGGF, please contact any Unit Trust office or Chief Representative or Agent, or selected Hindustan Petroleum or Indianoil petrol pumps

Or mail this coupon for more information to any of the Unit Trust offices

AND AGRICULTURAL GROWTH**

GROWING...

For the year 1990-91, we at LIC made it our business to insure more lives than ever before To protect more futures than ever before

As a result, we succeeded in bringing more than 1 crore people under the protection of life insurance.

**Through 86,48,192 Individual Policies for a sum assured of Rs. 28,152.16 crore
And 11,823 Group Insurance Schemes for a sum assured of Rs. 3,392.05 crore.**

All this with the country going through a year of constant upheaval

GROWING...

Furthermore, what makes LIC's growth so exceptional is that it's a growth over an ever-increasing base, year after year Making LIC one of the largest financial institutions in India
But, as usual, we have set our sights even higher for the next year

GROWING

**LIC's new business reaches
an all-time high of
Rs. 28,152.16 crore.
Insuring over 1 crore lives*.**

June 29, 1991

Population and Agricultural Growth

The emergence of the agrarian class in India can be properly understood only in terms of the class structure and class relations not only of post-Independence India but also of the pre-Independence period under native and foreign economic and political powers

A-46

An analysis of the interrelationships between the components of population growth and the characteristics of agrarian change offer some interesting insights. Have prosperous regions experienced higher population growth through natural increase or immigration? What is the demographic picture of stagnation and decline?

A-63

Playing Safe

While the Ramamurti Committee Report on Education shows evidence of a certain independence of mind and boldness of assertion, the political circumstances in which it worked may have persuaded it to conform to conventions rather than stick out its neck

1605

What Now?

The Congress Party's internal cohesion is bound to be in question and its break up will remain very much on the agenda as part of the wider realignment of forces. Its validity as an all class all purpose party no longer holds

1589

The present crisis in the Congress Party and the political system has given rise to no talgia about the past and a yearning for a centrist ideological consensus along Nehruvian line. Is such an option available at all today?

1598

Many Gujarats

There is evidence of growing regional inequalities in Gujarat which, if left uncorrected, may lead to serious social and political instability in the State

1618

Impact of Technology

While the impact of the Green Revolution on the development of capitalist farming has not been as rapid as anticipated by some critics, technology induced changes have contributed to growing proletarianisation and casualisation

A-69

Election Fall-Out

Now that the Janata Dal has been reduced to a near insignificant political rump, it must examine the performance of its government at the Centre. Why did the party fail to live up to the high expectations it had raised?

1585

Congress Culture

Though grief was the ostensible excuse for the election related violence in Tripura directed by Congress(I) heavyweights including ministers and MLAs, the main aim was to eliminate all opposition

1588

Saffron Hues

The BJP's electoral gains in West Bengal are evidence of the fact that it has been able to establish linkages with rural social forces which could in time adversely affect the ongoing none too radical agrarian reforms

1592

The BJP is already preparing for the political battles of the next poll. It will not whip up strikes nor encourage agrarian unrest, but will focus on further alienating the middle class from the Congress(I)

1582

Labour Markets

Kerala's performance in the social sectors has indeed been creditable. But can the State sustain this pattern of development? An analysis of the relationships between wages, employment and output in the agricultural sector gives some insights

A-82

Going Nowhere

President Bush's enthusiastic education proposals have no chance of success because of the unwillingness of the government to devote resources to education

1593

LETTERS TO EDITOR

Protecting the Unjust

THE Union home ministry has decided to assign National Security Guard (Black Cats) for the protection of the chief election commissioner (CEC). It is a pity that the institution of the Election Commission has come to such a pass after 40 years of existence. Even during the worst days of Indira Gandhi, when the institution became almost a part of the executive, no such protection was needed for its chief.

For the last three months, the CEC has been acting strangely, to say the least. He seems to have got an impression that he is a super-government. In fact the CEC is only a figurehead of a vast and prestigious institution. He has no authority of his own. He is like the president of India. Even the local officers of the government act for and on behalf of the president, but the president has no authority to act on his own, except in rare cases. Similarly the CEC is a respected figurehead. He has to act through others.

The CEC has no authority to order a repoll, much less to countermand an election. Both the sections 52 and 58 of the Representation of the Peoples Act (RPA) make this very clear. Under section 52, if a candidate dies before the beginning of poll, the Returning Officer (RO) has to be satisfied of the same and then countermand the election. Under section 58, which is an amendment to the act passed in 1988, the returning officer can countermand an election if there is violence and malpractice. In neither case is the CEC in the picture. The only provisions in these sections are that the RO should inform the CEC of the developments. The CEC comes into the picture only when a new date and time is fixed for the countermanded poll. But T N Seshan, the CEC has been behaving like a king. He countermands election even without a report from RO; threatens to cancel (!) a notified election; and demands that such and such forces should not be deployed. If one commits such atrocities on an helpless people, I dare say that, leave alone Black Cats, even wild cats cannot save one.

Two Questions

BRINDA KARAT has claimed (May 4) that 'on all major issues facing the women's movement the CPI(M) and the left parties have taken an unambiguous pro-woman stand'. Being a citizen of West Bengal, I would like to raise two questions in relation to her argument.

Archana Guha, who was brutally tor-

tured in detention in the seventies, has been carrying on a sustained legal battle in West Bengal for some years. The case is still pending in the court. Meanwhile, a demand has been raised by APDR (Association for Protection of Democratic Rights) and concerned citizens in Bengal for suspension/punishment of the responsible police officers. In a pamphlet published by APDR (1987), it has been alleged that the main accused officer in the case has got promotion under the Left Front regime. What does this signify?

In her well known reminiscences (1989) of prison life in different jails in West Bengal in the seventies, Jaya Mitra has vividly portrayed the unbearable living conditions and inhuman treatment of women prisoners with special reference to downtrodden women. Also evident in her account is rampant corruptions in prisons. What sort of reform has been initiated by the Left Front government of conditions in the prisons that distinguishes it from the earlier regimes in West Bengal?

The protagonists of a left-democratic movement cannot remain silent on these questions.

ARIJIT KUMAR SEN

Calcutta

Assault on Dam Oustees

BEING a social worker, I am deeply involved in the movement against the Icha dam near Chaibasa, Bihar. Almost all the signatories of the letter published (EPW, May 25) are personally known to me. I can vouchsafe that all the arraignments made by them are more than 100 per cent correct. Fraudulence by the project officials and contractors apart, the tribals of the

to-be-submerged villages are being regularly harassed and cheated. Even today, a tribal youth is rotting in Seraikela jail with some false criminal charges.

I request the government to order a high-level judicial enquiry into the matters highlighted by the signatories, and bring the real culprits to book.

It should be noted here that, while on the one hand the tribals may perish due to non-rehabilitation, on the other, monetary monkey-tricking by the contractor-official machination may cause substandard construction of the dam and bring on a catastrophe.

Soviet Developments Anticipated

MUCH attention has been paid to the recent changes in the Soviet Union and Eastern Europe in your journal. These have been discussed over and over again from many viewpoints. But one finds a certain one-sidedness in the whole affair. Many regarded these changes as the 'restoration of capitalism' in the USSR and the East European countries—this aspect has not found attention. A lot of literature has been produced regarding the nature of the changes wrought by the Khrushchev-Brezhnev regime. We have reprinted one of these rare books, *Red Papers—How Capitalism Has Been Restored in the Soviet Union and What This Means for the World Struggle* (first published in 1974). Copies of the book are available from Post Box No 244, Patna-1.

No Room for Consensus

THE government has sought a national consensus on the economic policy measures it proposes to take. Admitting that "the economy is in a crisis", prime minister Narasimha Rao said in his address to the nation on June 22 that in dealing with the crisis "we should rise above sectional interests and partisan politics". The newly-appointed finance minister, at his first press conference three days later, similarly called for a general agreement on the tackling of the economic problems facing the country. The fact of the matter, however, is that, in the brief period the government has been in office, it is amply evident already that, even as it has talked about the need for a consensus, its approach to the problems facing the economy is nothing if not partisan, revealing which sectional interests it considers sacrosanct and which expendable. This is true not only of what has been disclosed so far about the specific economic measures the government intends to pursue or of its view of what causes have led to the present impasse, but even of its perception of the content of the economic crisis itself.

Official pronouncements on the gravity of the economic situation have sought to focus attention exclusively on the difficulties on the external payments front. Of course, the country is—has been for some time now—on the brink of external bankruptcy in the sense of being in danger of defaulting on its debt servicing obligations which have ballooned as a result of the borrowing spree indulged in by successive Congress(1) governments which were in office in New Delhi for all but one year of the decade of the 1980s. But in what sense is it any less a disturbing aspect of the performance of the economy that during this very period the pace of growth of employment has dropped off rapidly so that the numbers of those unemployed are currently at record levels? It is a well-documented fact that the rate of growth of employment in the so-called organised sector of the economy throughout the eighties was barely one-half the rate of growth of the workforce and that in manufacturing industry itself there was hardly any expansion of employment at all over this long period of years.

But it does not evidently suit the government to acknowledge this crisis—the relentless growth of the already huge mass of the unemployed and the underemployed in the country. This is not only because the threat of external bankruptcy is so immediate. It is more calculated than that. Very clearly, the one thing the government is least inclined to do is to talk about the series of policy changes, the

so-called economic reforms, introduced by the government of Indira Gandhi and speeded up under Rajiv Gandhi, which have been responsible as much for the slowing down of employment growth to a tiny trickle as for bringing the country to the brink of external bankruptcy. This was made clear by the finance minister's attempt at his press conference to suggest in all seriousness that the country's foreign exchange difficulties were to be traced to the steep decline in the quantum of concessional aid flows!

It is obvious why the government wants to keep attention away from the import-guzzling, employment-destroying patterns of investment and growth promoted in the eighties in the wake of the 5bn SDR loan from the IMF through the simultaneous relaxation of regulations governing domestic industry and of controls on imports. It is these policies which led to the boom in imports and, given the compulsion to borrow on progressively more onerous terms to bridge the growing gap between imports and exports, the sharp rise in debt servicing obligations. But what the government is proposing to do, once again under the garb of economic reform and restructuring, is to pursue precisely these same policies ever more vigorously with the IMF and the World Bank cracking the whip. Industry and business are to be rendered even freer to invest in and produce what they will, untrammelled by all considerations of social needs and priorities, and residual restraints on imports, both of the tariff and the non-tariff varieties, are to be dismantled further according to the time-table so helpfully chalked out by the World Bank in its report on 'trade reform'.

The government's calculation is a simple one in essence. If it can manage to convince the IMF and the World Bank of its bona fides in respect to pursuing these policies then these institutions will come forth with large fresh instalments of loans which in turn will raise the country's creditworthiness in the eyes of the international private bankers so that the government can in addition resume borrowing abroad commercially as well. So the continuing excess of imports over exports can be paid for, the mounting debt obligations can be met and the boom in the life styles of the top decile of the population can go merrily on. All the while, the real economic crisis will persist and intensify—unemployment will grow, economic disparities will widen and the threat of disruption and devastation of the economy once the flow of foreign funds, temporarily resumed now, dries up, will loom ever larger.

All told, there is not much room for a consensus.

KERALA

Polarisation Helps UDF

THE Left Democratic Front (LDF) in Kerala is no doubt rueing its decision to terminate the life of the State legislature before completion of its full term and opt for assembly elections along with the general elections. Following the elections the LDF, which had a strength of 78 MLAs in the previous house, has been reduced to 50 while the United Democratic Front (UDF) has increased its tally from 60 seats to 89 seats.

It is not difficult to see the source of the LDF's optimism which prompted its decision. As recently as January-February 1991, in the district council elections the LDF had swept to power in 12 of 14 districts indicating a lead for it in 93 assembly segments. On that occasion the LDF had polled over 64 lakh votes as against the UDF's 58.4 lakh votes and the BJP's 9.1 lakh votes.

The outcome of the district council elections had been influenced chiefly by three significant factors. One was the divisions within the UDF particularly between the Kerala Congress groups as also between the rival factions of the Congress(I). Equally important was the increase in the votes polled by the BJP. The Ayodhya issue was also of some relevance to the extent the Indian Union Muslim League (IUMI) alienated a section of the Muslim voters owing to the Congress(I)'s prevarication leading to some restlessness in the IUMI's attitude to the UDF. The IUMI's brief separation from the UDF only fuelled the LDF's optimism.

Where the LDF miscalculated was in assuming that once it had rejected the IUMI's overtures for an alliance the latter would not return to the UDF fold. And when the IUMI did rejoin the UDF, the LDF blundered once again in assuming that the League would be unable to carry with it a significant section of the Muslims.

Had the conjuncture not altered within the space of a few weeks the LDF's calculations would have been vindicated. Though the LDF has been removed from government it has not suffered any real loss of votes. In this election too the LDF has secured 64,62,739 votes which is 45.1 per cent of total votes polled whereas in 1987 it had polled 56,96,827 votes or 44.7 per cent. In effect what changed was the UDF's vote which went up from 55,59,447 votes (43.6 per cent) to 67,14,933 votes or 46.8 per cent of votes polled.

Precisely those factors which the LDF was banking on failed to materialise. The LDF's losses are primarily concentrated in Thrissur, Idukki, Kottayam, Idukki, Kollam and Thiruvananthapuram districts. In 1987 the presence of rebel UDF candidates contesting as independents had its effect on the outcome. Independent candidates in Kottayam, Idukki, Pathanamthitta and Ernakulam took 10.2 per cent, 10.8 per cent, 7.4 per cent and 5.8 per cent of the votes respectively as against the State average of 3.8 per cent votes

polled by independents. In 1991 not only did the number of independent candidates come down but votes polled by them fell from 4,43,197 votes to 2,17,812 votes bringing the State level average down to 1.5 per cent. It is reasonable to relate this phenomenon with the visible dilution of factional unrest in the UDF.

Another critical factor which worked to the detriment of the LDF was the decline in the votes polled by the BJP. In 1987 the BJP polled 8,22,058 votes from 127 constituencies. Since then the total strength of the electorate has gone up from 1.58 crore to 1.95 crore while the total votes polled has gone up from 1.28 crore to 1.43 crore. In keeping with this it was therefore not surprising that in the district council election, the BJP polled over nine lakh votes. But in the 1991 assembly elections, despite the turnout of 73 per cent being the same as in the district council elections, the BJP's votes have declined to 6,77,385 votes or 4.7 per cent of total votes polled.

It is clear that a shift, not necessarily organised, took place from the BJP to the UDF. To some extent this is attributable to the CPI(M)'s rough and ready methods. For instance in Kazakkootam constituency in Thiruvananthapuram where three RSS workers were hacked to death, the BJP polled only 2,000 votes this time as against the 10,000 votes it polled in 1987. The UDF's margin of victory this time was a mere 650 votes. Given that in a number of constituencies the UDF's victory margins ranged from 400 to 2,000, the role of the BJP and the absence of independents assume crucial significance.

As for the IUMI not only was its base revealed to be intact but it was able to retain its hold despite tacit alliances involving the BJP in the Badagara Lok Sabha constituency and the Beypore assembly constituency.

ENVIRONMENT

Fading Green

OF late ecological issues have acquired a certain glamour. Not only are there innumerable high profile conferences on the environment, but because of the growing never say die popular movement environmental causes are instant attention getters. And Kamalnath, now at the helm of affairs, will ensure, just as Maneka Gandhi did in her own inimitable way, that environment will always be in the news. If his first press conference (and subsequent pronouncements) are anything to go by, Kamalnath does not appear to have a clue about the major problems facing his ministry. Or at least that would be the conclusion to draw if one were not aware of Kamalnath's background. But it is hardly likely that this ex-industry man does not see the issues. The attempt, a very deliberate one, is to shift the focus away from conten-

tious issues, while at the same time projecting an overall concern for the environment.

In the past (and not only during Maneka Gandhi's tenure) the ministry had chalked up quite a few successes and had directly and effectively intervened to reject or at least stall proposals which were not environment-friendly. But now the indications are that the ministry will be effectively demoted while at the same time retaining its high profile (by such moves as taking up the Third World cause in UN conferences which, important as they are, do not immediately affect vested interests here). Kamalnath has categorically stated that the ministry will not reject environmentally unsuitable projects outright. Instead the authorities will be given an opportunity for 'self appraisal'. He wishes to bring to an end "this perpetual confrontation" between industry and environment. Clearly, this is all a part of the coming 'no rules' regime for industrial expansion.

Most disturbingly, the new minister has admitted that he has not given much thought to the Narmada issue. That this should have come at a time when several villages in Maharashtra are in danger of being flooded by the river waters because of the dam is an indication that the issue has already been settled as far as the ministry is concerned. And worse, his proposal to involve youth and students as "a kind of environmental police" to check "environmentally degrading activity" is ominous. Given Kamalnath's close links with the youth wings of the Congress, and given the kind of elements who dominate these groups, the suggestion of an "environmental army of sorts" must be immediately challenged. This is obviously meant to counter the growing environment movement.

ECONOMIC AGENDA

Not Political?

A Correspondent writes

THE induction of Manmohan Singh as the Union finance minister and his initial exercises in loud thinking on some of the crucial economic issues facing the nation have induced louder acclamation in certain quarters of his envisaged freeing of the economic policies from political embroilments. They all, however, overlook the fact that a separation of the two is not really possible. Indeed, in all his utterances Singh himself is displaying his predilections for a particular socio-political slant. Some of his predispositions may be easily identified.

First of all, he seems to have ruled out the touching in any way of the 'holy cow' that is the high level of military expenditure, even temporary cutbacks on which could help ease pressures on internal expenditure as well as the balance of payments. Singh, obviously, is not inclined to hurt the political Establishment, lining their own purses

through these huge transactions and banking in the glory of India's so-called 'medium great power' status

Then, he has positively ruled out cuts in imports of petroleum, the biggest single item in our import bills, although this measure, accompanied by a rationing of petrol, could be of great help in meeting the present foreign exchange crisis. Apparently, it is unthinkable for Singh and the present government to resort to this step as it would hurt the proliferating new rich and the expanding industry that caters to their fancy.

The most glaring omission in Singh's articulation so far is his silence on Rajiv Gandhi's NEP. The immense harm that this policy has inflicted on the Indian economy by the initiation and expansion of various luxury product industries ranging from oil to limousines, all with MNCs' participation and with high import contents is a well known fact.

On the contrary, Singh has taken the Left academics to task for creating 'scare' about the multinationals. The role of the MNCs, and IMF which works in tandem with them, in distorting the socio-economic and political orientations of the Third World countries has been too widely researched and documented to need any comprehensive substantiation. In short, to quote from a recent research paper, the dynamics of 'internationalisation' that results from conceding a major role to the IMF and MNCs "involves some changes in the institutional form of the state, its policy orientation and policy formation processes and in some sense a modification in the state's economic sovereignty".

Hence, contrary to his bland 'non-political' professions Manmohan Singh has been actually espousing profound politics only of a kind that is not to best interests of the country.

KASHMIR

Caught between Gangs

THE administration of Jammu and Kashmir had been dismissing all these months allegations of atrocities by security forces as terrorist propaganda. Now, it has suddenly been compelled to admit that such atrocities do take place. The state's governor, Girish Saxena, at a recent meeting in New Delhi acknowledged that there had been "killing of passersby and others by security forces in reaction to militant attacks on them". He did not explain however why security forces should kill passersby, instead of the militants who attacked them. A case of mistaken identity? Or sheer cowardice, venting anger on the innocent?

Saxena was referring to the latest incident in Srinagar. On June 11, the Central Reserve Police Force (CRPF) jawans went berserk in the Chota Bazaar area of the city and killed at least 18 people on the spot while many

more died later of bullet wounds. The firing was 'uncontrolled', according to the government's own version, announced one day later. But the initial report released by the government on the first day described those killed as victims of an "exchange of fire between militants and security personnel". This was in keeping with the now familiar knee jerk reaction of the Kashmir administration, which ritualistically chants the 'mantra', 'killed in cross fire', whenever faced with allegations of killing of innocent citizens.

Information pouring in from eye witness accounts of the incident suggests that the CRPF in a systematic and deliberate way went about slaughtering the people. A reconstruction of the sequence of events indicates that a CRPF jawan was killed earlier on that day by a group of militants near the Syed Mansoor Bridge in Srinagar, when the latter attacked a security force's bunker there. Two and a half hours later the CRPF retaliation took place. Twelve CRPF jawans—who were off duty, and resting in billets near Chota Bazaar—came out with guns and marched to Chota Bazaar and indiscriminately opened fire on the people there. Among those killed were shopkeepers, drivers of auto rickshaws, bystanders, a 60 year old woman and a 10 year old boy. Five witnesses say that the jawans were dressed in vests and shorts.

In the face of the public outcry against such blatant vindictiveness by the CRPF, the government had to hastily retract its earlier fabrication about deaths in 'cross fire' and order an enquiry. Probably realising that routine enquiries (as ordered in the past) do not inspire much public confidence (as none of the enquiries ordered till date has produced any report), the government decided to hand it over to the Central Bureau of Investigation (CBI). We hear that the 12 CRPF jawans have been removed from active duty. None of them has either been suspended or arrested for murder pending investigation, which is what should have been done under the law of the land.

But why is there this sudden acknowledgment of CRPF misbehaviour, or readiness in conceding to a CBI inquiry? Does it indicate a change in the stance of the newly installed Central government towards Kashmir? Is it a conciliatory carrot for the consumption of the Kashmiri public? Or is it an indication of the civil administration's loss of control over the security forces (on which alone the Centre had been depending all these months to solve the Kashmir problem)? Incidentally, one of the advisors to the Jammu and Kashmir governor, who was staying in Delhi on the day of the Chota Bazaar massacre, was reported to have confided to his colleagues in the bureaucracy that the CRPF had 'mutinied'. In public, however, he stuck to the first official version of 'deaths in cross fire'.

It is quite obvious that contradictions and self-interest-motivated pressures are building up within the administration which are further bedeviling the already blighted Kashmir policy of the government. Some time ago, a senior officer of a Central intelligence wing who is in charge of investigating into alleged foreign links of the Kashmiri militants, was caught red handed in his New Delhi residence by his own departmental colleagues when he was accepting a neat package of bribe from one of the accused involved in a case concerning his area of investigation. Given this state of affairs in the intelligence department, how can the public trust the sensational disclosures about arrests of 'dreaded' Kashmiri terrorists frequently dished out by the home ministry? Are they really terrorists? or just potential hostages—people who can shell out the ransom required for their release for the private coffers of enterprising officers of the CBI, IB, RAW and the host of competing intelligence agencies? It seems that the common people of Kashmir are caught between two gangs of 'kidnappers'—the militants and the security forces. While the government cannot suppress the former, it will not punish the latter. By occasionally apologising for the misdeeds of the security forces the administration cannot hope to command the respect of the people of Kashmir.

WORKERS' HEALTH

State-Industry Collusion

THE US Occupational Safety and Health Act, 1970 (OSHA) has long been considered a landmark in workers' struggle to institutionalise and give legal form to their right to a clean and safe workplace. Although it has seen many changes, most of which have resulted in diluting the legislation, it continues to be among the most stringent of labour laws in the world. Given this, the *Multinational Monitor's* recent survey of the Act's enforcement is a revealing comment on just how well state and industry collude to render ineffective even the most progressive of laws, if it damages industry's interests.

The survey analyses completed OSHA inspection reports from 1982 through 1990 for the 10 largest US corporations—Chrysler, Dupont, Exxon, Ford Motors, General Electric, General Motors, IBM, Mobil, Philip Morris and Texaco—which among them cover a wide range of industrial activity. The survey finds that in more than 67 per cent of the cases of violations of the law, the prescribed penalties have not been levied for one reason or the other. And among the cases where fines were imposed, in more than 86 per cent, the fines totalled \$ 1,000 or less, thus making a mockery of the Act. Out of the 759 inspections analysed, in only 12 cases were total penalties between \$ 5,000 and \$ 10,000 levied and only in 11 were fines of \$ 10,000 or more levied.

Part of the reason for this sluggish implementation of the Act could be the cut imposed in the OSHA budget in the Reagan and Bush administrations which has, among other things, meant that the number of inspectors under OSHA remain an inadequate 1,200 for the seven million workplaces to be inspected under the Act. In justifying these cuts the government has tended to emphasise the dubious philosophy of 'voluntary compliance' with safety standards. This has, of course, never worked and critics have dubbed it a 'farce'. They suggest that only when OSHA inspectors are stationed in companies on a daily basis, just as are internal revenue personnel, can there be 'voluntary compliance'. Interestingly, in 1989 an OSHA inspector Den Tolgren had (in his book *Dangerous Premises: An Insider's View of OSHA Enforcement*) reported that the legislation worked most efficiently in places "where there are strong and responsive union representatives". He suggested then that "worker empowerment was crucial to combating corporate disregard for worker health and safety".

This is something that should be kept in mind while lobbying for more stringent health and safety legislations in this country as well.

SOUTH AFRICA

ANC under Pressure

WITH the scrapping of the Land Registration Act by parliament, South Africa enters the second phase of the process initiated to 'dismantle apartheid'. The withdrawal of economic sanctions by the EC and Japan, and the promise to do so by the United States, has put the African National Congress (ANC) in an awkward position. Only days before the US announcement, Nelson Mandela then ANC deputy president was in Washington calling for the continuance of the sanctions. All along while making various concessions on such issues as the future role of foreign capital, the ANC has been arguing that sanctions should remain in place so long as apartheid is not completely removed, acknowledging that sanctions and other forms of international pressure had gone a long way in the fight against apartheid.

Not just has the ANC lost ground on the continuation of international sanctions, Mandela and the leadership are facing a major upheaval within the ANC as well. The moderates within the ANC, led by Mandela, are seen by the organisation's militant wing as having made far too many concessions to the government. This pressure has forced Mandela to admit publicly that the ANC leadership may have overestimated the regime's genuineness in wanting to dismantle apartheid and that it may have gone too far in agreeing to concessions. For his part, de Klerk has sought to take advantage of the

dissensions within the ANC by suggesting that Mandela and he enjoy a special relationship. As the ANC enters a critical phase in the negotiations with the regime, differences and bitterness within the party are on the increase, inevitably perhaps.

A further problem for the ANC is the growing conflict with the Inkatha Party and the resultant violence in black townships on a scale not witnessed before. The ANC's failure to find an effective solution to the violence has tarnished its image. It is faced with declining support and the fear even among those who continue to support it that it is no longer capable of protecting the black majority.

The government has done little to stem the violence. It has taken an ambiguous position on banning personal possession of weapons—one of the demands of the ANC for resuming negotiations—claiming that the carrying of spears is part of Zulu tradition. The government's failure to act to end township violence tantamounts to complicity. More generally the government's large security apparatus continues to operate in an overt and covert manner harassing ANC cadres and inciting violence. Official statements on new restrictions on the police are belied by the fact that expenditure on the police has been raised by 53 per cent this year.

De Klerk's actions are part of a wider strategy to deliver a constitution acceptable to the white minority, the basics of which he hopes will be agreed on at an all party conference. The ANC agreed in principle to an all party conference in February 1991, but reverted last month to its demand for a constituent assembly and an interim government. While the February statement had been tactically necessary at the time, it does give de Klerk a better bargaining position.

While de Klerk and his embattled National Party were forced by circumstances into initiating the process of dismantling apartheid, the ANC in accepting a negotiated settlement was also accepting the pitfalls attached to such a process. At the end of the first stage of the negotiations de Klerk has done all he could to safeguard white interests by winning over Western support away from the ANC, by diluting the faith of the black population in the ANC and by furthering divisions within the ranks of the ANC.

Faced with major onslaughts on many fronts as it prepares for its first national conference in 17 years, the ANC leadership has called for the stepping up of "mass action" which "is the only legitimate form of expression in the absence of voting rights" while warning the government that it has merely "suspended" and not "terminated" its armed struggle. There is little doubt that the leadership has been influenced by impatient voices within the ANC which are likely to grow more insistent as Nelson Mandela, in his new role as president, leads the ANC back to "the theatre of struggle".

TWENTY YEARS AGO

EPW, June 26, 1971

If the objective was to secure as large an aid commitment as possible, then the discussions at the Aid Consortium meeting at Paris may be said to have gone off fairly smoothly this year. The rate of growth of the economy (though with agriculture contributing the major part of it) was a respectable 5.5 per cent in 1970-71. And for all the radical talk, no new steps have been taken in the fields of nationalisation or industrial licensing to cause offence to the foreign donors or to the World Bank's economic myth-makers (nationalisation of general insurance having been already discounted as an irrelevance). On the other hand, the government formed after the parliamentary elections earlier this year must appear to assure 'political stability'—a commodity much sought after by the world's aid-givers but equally rare among the aid-receivers. And like all 'stable' governments, this particular one has appeared to be in no hurry to do very much which, again, is on the whole reassuring to the aid-givers. Finally, the patience of the government in bearing the economic burden of the refugees from Bangladesh without taking any drastic political or other action deserved and got sympathy from the aid-givers. So, everything taken together, there could not have been a more favourable constellation of circumstances for going to Paris with a bigger begging bowl.

★ ★ ★

There is a reason why interest should attach to the annual report of the ministry [of industrial development] this year particularly. It is by now clear enough that the recovery from the industrial recession has been neither as quick nor as automatic as had been expected two years ago. The industrial growth rate actually declined in 1970. But even more important are the structural problems facing the industrial sector, as reflected in the persistent underutilisation of capacity in a wide range of capital goods industries—most of them the very industries which had been hand-picked for large investment in the Second and Third Plans as being vital for laying the basis for long-term industrial growth. Clearly, there is need for formulating a medium-term strategy for industrial growth which will build on these past investments instead of allowing them to become a millstone around the neck of the economy. However, one looks in vain for any traces of thinking along these lines in the Report of the Industrial Development Ministry.

Metastasis of Parenthood

Deena Khatkhate

Children in America suffer not from malnutrition or hunger as in much of the world; they are tyrannised by the decay of moral values, the ruination of families and the dehumanisation of society.

THE elementary question of why parents desire children becomes elemental here in American society. Parents have their broken marriages, fathers their sexual perversities, administrators of educational institutions give vent to their sexual fantasies and custodians of day-care centres sexually abuse and physically torture their wards. A man fights not for his own present so much as for the future of his children, he seeks riches for their welfare. But see what is happening in America—children are shamelessly used for sexual molestation, not by lumpen child-lifters, but by the parents who brought them into this world.

There is a saga that has just ended—poignant, tragic and inhuman. Dr Elizabeth Morgan Foretich, the mother of a seven year old daughter, hid her from her husband, a doctor, whom she accused of molesting the child when she was two years old. She was jailed for two years following a court order to bring her daughter back from hiding so that her father could exercise his visiting rights. Only when Congress amended the law was the mother released. When she came out of jail under special dispensation of the Congress, the first thing she did was to remarry. Soon after her release the father of the child, who had employed professional detectives spending thousands of dollars to locate his daughter's hideout, eventually succeeded in tracing her to her maternal grandparents in New Zealand. The judicial fight moved from the American court to a New Zealand court. The judge in New Zealand has now given his verdict that the daughter should remain in New Zealand with her grandparents without being visited by her father. The judge ruled that visits by the father would place the daughter "in the midst of parental conflict with the inevitable disruption of her emotional security." Well, did the judge find any evidence of incestual behaviour by the father? Not at all, and yet the judge did conclude that Elizabeth Foretich and her parents had often told the child, Hilary, about having been abused by her father and for Hilary this became the reality, whether or not the belief had any basis in fact. Who is guilty then? Father? Mother? Mother's new husband? Grandparents? Or all of them who used the child as a weapon in the parents' marital

warfare?

From medical doctors you turn to a respected, tenured professor of nuclear engineering at a Maryland University who was accused by his grown-up daughter, now married, of subjecting her to incestual sexual abuse since she was eight years old. She waited 18 long years to take her father to court. The court released the father but not without challenging the character of the daughter. There seemed some shred of evidence—flimsy and speculative—that the daughter wanted to extract money from her father with which to help her husband to meet his alimony payments to his first wife. A daughter could have conceived of a thousand other accusations against her father, but she chose the one which was symbolic of the modern era. Whether right or not, credible or not, parental sanctity is being assaulted day in and day out. And it tends to acquire credence because everyday families are being destroyed, despite the Republicans' sales talk about the nobility and sanctity of families in American society. There is something mysteriously amiss in all this. Accusations of incestual crimes do not come out of the thin air. The social mores of this sociologically disturbed society are changing. If the wife does not care for the husband and the husband does not care for the wife, why should sons and daughters care for their parents? If Ann Landers' daily column mirrors changing American society, it offers plenty of evidence of these perversities surfacing at different layers of society. One recent letter from a daughter asks Ann Landers why she should not marry her father when he needs the care and attention which her late mother gave him.

And a startling indictment of the surrogate parents in the day-care centre has recently come from California. The whole family—father, mother, son and daughter—who have been running a centre for young children were indicted for child abuse, ranging from sexual perversities to inhuman beating of the hapless innocents.

One would like to believe that these stories are not typical of this society and that, as in any other society, these represent some stray aberrations in behaviour or some psychic disorder. But now comes a new phenomenon, which is superficially

different from the libidinous misadventures of parents or day-care centre guardians. A couple, Abe and Mary Ayal, have decided to have a baby. It is not a surprise that they should have a baby, but it is certainly more than a surprise to be told that they want to conceive the baby to use a part of that baby to save their other dying baby. The grown child, 17 years old, is dying of leukaemia and she can be saved only by a bone-marrow transplant from a donor having compatible genetic characteristics. It is as if they want to have a child to provide 'spare parts' for another. The parents know that removing bone marrow from an infant child is risky; the child may well die of shock. They know too that there is no more than a 25 per cent chance of the older child surviving even with the bone-marrow transplant. Perhaps the child they have raised for 17 years has a greater right to life than the one that is just born. Why beat your breast? Do you not champion abortion to slow down population growth? Newly born children are little more than a developed foetus; the aborted one is little less. Both have life and if one's life is to be destroyed to save another's, is it not better than the elimination of life which is what abortion means? This is a democracy, and freedom is precious. What if the right to choose supersedes the right to life?

This is not the brave new world of Huxley, this is a selfish technocratic world where biotechnology, genetic engineering and Freud's libido are spiralling in a devilish dance. You yearn for children and you generate them, if necessary through in vitro fertilisation or by creating surrogate motherhood or by the bastardisation process. But then why destroy them by use of the same technology? Is it another kind of manifestation of the law of 'haves and have nots'? Daniel Moynihan, a Democratic senator of the US Congress, is moving heaven and earth to improve the lot of the nation's children through new welfare legislation, because he found that 22 per cent of children born in the late 1960s were dependent on welfare. But his perception that "the problems of children in the United States are overwhelmingly associated with the strength and stability of their families and that our problems do not reside in the nation but in our behaviour", is totally off the mark. Children suffer not from malnutrition or hunger as in much of the world, they are tyrannised by the decay of moral values, the ruination of families, the dehumanisation of society brought on by the onslaught of the mindless advance of the new biological sciences. The malaise is deep, the children, those beautiful flowers in life's garden, will wither away even if they are kept alive through the transplant of spare parts.

Calcutta Diary

AM

The east Europeans had stable prices, rationed food generally in reasonable quantities, ample clothing even though somewhat unimaginative in design and quality, housing of some sort; they had full employment, generous social security arrangements, subsidised education and health care, and music and culture organised for the millions. But the east Europeans were hustled into choosing. They chose to be free. They have chosen galloping prices, steeply declining production, unemployment for 50 per cent of the workforce and social chaos. Here, in India, the shapers of our destiny are now being asked to be inspired by the example of the east Europeans.

A CRAZY, bloody, over considerable parts unfair, general election, rendered crazier by a chief election commissioner both incapable of being fair and determined to play God. And now, even before the new government is properly assembled, the pressure is on: the foreign financial institutions are waiting, the government, the first thing it must do, is to sign on the dotted line. It will be crazy not to accept the suggest of advice the foreigners are proffering. In any case the government must further open up the economy. This may hurt on all sides, the foreign exchange crisis may turn into a permanent one, the country's exports may not show any spectacular improvement. So what, there will be, the foreigners say, other compensations. Exposure to the outside world will make the economy more efficient. Competition forces men and women to give of their best. Once we cross over to full-fledged liberalisation, goods and capital and expertise will begin to percolate from outside, India will become a bustling, modern country. What a nice feeling that prospect provides. Of course, given the circumstances, such liberalisation is contingent upon the back-up of unlimited foreign exchange, which we do not at the moment have. The country in fact is already sucked into an external debt trap of the gravest magnitude. Not that the dispensers of advice are not aware of the predicament. Pride however goeth before a fall. They ask us to swallow our pride, and allow foreign institutions to bail us out and take charge of our destiny. That could be bitter medicine, but we must look at the bright side of it: in a few years' time we will emerge as a strong, economically efficient entity.

We must learn from the example of the east Europeans. They were the original exponents of the closed system. More than any others, they know what a disaster that was. They suffered, for decades on end, privation of the indescribable kind;

unimaginative food, often in short supply, drab clothing, cramped housing, in sum, a gloomy, cheerless existence. Only a handful amongst them, those in the good books of the party caucus, lived it up. Thank goodness, even the worm learns to turn. It took them some 40 years, but the labours of Radio Free Europe and Eurovision have not been in vain, the east Europeans have finally opted for freedom, they have dismantled the planning apparatus and those wretched controls that went with it, goods and men can now flow in, and flow out, freely, uninterrupted. If those centrally planned economies could give up their shackles, why cannot we? After all, in our case no ideology is involved, pragmatism should determine our basic economic decisions. Why must we then be afraid of slipping into efficiency?

The dictionary meaning of efficiency is vague, as vague as it can be: to work well, quickly and without waste. Working well, but according to whose judgment? And if briskness is efficiency, a crowd of rioters, systematically making a bonfire of shops and houses in the neighbourhood, is outstandingly efficient. Consider also this business of wastelessness. A rampaging mob concentrates its anger on specific targets, it does not allow its frenzy to be deviated, is that what wastelessness is about? Efficiency is sometimes alternatively expressed in terms of the ratio of work done to energy expended. No Jestling Pilates are alas around to regale us with cynical comments which could illuminate the definition. Even so, consider Poland or the territory which was till yesterday known as the German Democratic Republic. It has taken less than two years to reduce at least one-half of the working force in both countries to a state of worklessness; production has plummeted, and the level of unemployment over there is today even higher than what it was in north America or Britain in the nadir of depression. Unless funds of an astrono-

mical order are pumped from outside, it would be impossible for Poland and eastern Germany, we are told, to reduce this load of unemployment. Is that not waste, to have one-half of the labour force stay idle for months and years on end? Once they are idle, the equipment with which they used to work are also forced into idleness. Is it therefore not a double waste, of men as well as of machines? The inert machines are of course saved the bother of wasting any further energy when they are idle. As far as the workers are concerned, they have however to spend their energy even when out of employment. They have to search for work and for food. At the end of the day and the week and the month, for the bulk of them, the story is of unmitigated despair. Where does efficiency enter into this picture?

Or are we missing something? Prices in both Poland and eastern Germany have reportedly jumped 10 times over the past couple of years. That, in the view of the economic liberators, is an exceedingly encouraging development. High prices, they point out, reflect the true degree of scarcity of goods. In the past, rigid price controls had been most unwisely clamped on so-called essential commodities. Such artificially low prices discouraged supplies and gave rise to a flourishing black market. The black market in fact was the honest surrogate of social reality, prices quoted in it were the true index of scarcity. Liberalisation is vindication of the free market principle, the distinction between the official price and the black market price is obliterated, the black market price receives cognisance as the formal operational price. True, this price, more often than not, is beyond the reach of the ordinary man and woman. Output and employment shrink, money wages and subsidies are cut for those still engaged in work, prices jump by roughly one thousand per cent. Like London Bridge, the standard of living of the average citizen keeps falling down. Is this phenomenon then what is to be described as efficiency?

We will be admonished to cut out such frivolities. We must look at the bright side of it. Even in eastern Europe, a number of industries have made their entry, or re-entry, in the aftermath of the collapse of the planned economic arrangements. Is that not a sign of health? The stock exchanges are back. Moreover, all work and no play, who does not know, makes Jack a dull boy. Hungary and Poland and Czechoslovakia have been extricated from that fate. The liberated libido of east Europeans was a vast *tuhula rasa*. Nature abhors vacuum. Pornography is already emerging as the leading industry in these countries.

One swallow though does not make an uninterrupted summertime. Empty bellies

besides, are not generally conducive to the appreciation of pornographic pictures; one also needs some minimum cash to gain entry into a theatre which specialises in live sex shows. The hundreds of thousands at present unemployed are obviously without such wherewithal. Those who expected a miracle in the offing are therefore going to experience a heart-break. pornography is unlikely to emerge as the leading sector in economic development in post-Marxist eastern Europe.

But the difficulties east Europe is facing, we will be finally told, are only frictional. When sweeping changes take place in society, there are, inevitably, some problems of adjustment, the east European countries will have to travel along the necessary learning curve, they have to teach themselves the rudiments of cost effectiveness and all that, it is only when these lessons are fully absorbed that we might expect satisfactory economic performance in these countries. Be reasonable, the mess created over 40 years cannot be cleared overnight, and no use quoting Maynard Keynes, he has been dead for some forty-five years.

Meanwhile, we should do well to allow the significance of president Gorbachev's importunings before the former director of the Central Intelligence Agency, the present president of the great United States of America, sink into our psyche. It is not for nothing that the Soviet leader has re-classed himself. He has seen the light. The vacuity of Marxist economic practice, epitomised in the surcease of the central planning apparatus, says it all. The social welfare function, has not Ken Arrow proved it already, is as outrageous a notion as there can ever be. A philosophy of life which is unable to satisfy the elementary needs of the people stands self-exposed. Now that Marxism is officially defunct, economic controls of all descriptions, silly offshoots of socialist and pan-socialist thought processes, are bereft of even a minimum rationale. Mikhail Gorbachev could not agree more. He is committed to dismantling the old system. At the moment, he is only for 20 per cent dismantlement, he is concerned over the possible angry reaction of housewives confronted suddenly by a 10-fold increase in prices and of workers rudely thrown out of jobs. The former Director of CIA however wants his friend Gorby to go all the way, and immediately. No doubt they will reach a common ground of understanding. Why cannot we learn from the inspiring example of comrade Gorbachev, and let go of our own clumsy system?

Mikhail Gorbachev, out with his begging bowl, may yet get his 250 billion dollars, or he may not. He can be safely left to his fate. As he has himself gone on record, in this nuclear age, none is his

brother's keeper. Should the writing of history nonetheless be diverted on to wrong rails? The collapse in eastern Europe had little to do with any wobbliness in the philosophical foundations of socialism, nor has it revealed any grievous deficiency in the logical structure of the magnificent law of social dynamics known as Marxism. Barring the polemics the so-called impossibility theorem has thrown up, few valid issues have been raised, on purely epistemological grounds, against the principles of a command economy. There is also this latent irony: the end-point of the socialist quest is hardly much afar from the destination sought by theoreticians extolling the virtues of the free market. It is in both instances the maximisation of satisfaction for society's largest number. What has been repudiated in Poland and Czechoslovakia and Hungary is not Marxism, but the party apparatus which allowed itself to be divorced from proletarian realities, party life ceased to be, and was displaced by a perverted elitism. Signals therefore began to go wrong. The command system did not fail, the command system was put to wrong use. Because it was fed wrong facts and issued preposterous instructions, chaos became king. At that awkward moment, Mikhail Gorbachev pressed the panic button, and called his soldiers and economic advisers home. He had, continues to have, the gleam of 250 billion dollars in his eye, that could still save what remained of the Soviet Union, the rest of east Europe is an irrelevance following the burial, several fathoms deep of the international brotherhood of the working class.

Facts are however, difficult to be rendered into unfacts. The idea of material balances the Soviet planning authorities had introduced in their working sheets way back in the 1920s was a trail blazer. Wassily Leontief carried the precious cargo when he migrated from Gosplan to Harvard. With a bit of embellishment provided by Walrasian general equilibrium, that bag of tricks has provided inspiration for

much of the macro-economic forecasting. American financial experts have specialised in the post-war decades. Little reason for feedstock for the goose not to be feedstock for the gander too. The east European catastrophe is not on account of an organic fault in the working apparatus, nor is it attributable to any latent poverty in the underpinning of philosophy; it is more because of the failure to transmit the spirit of the philosophy into the processes of one's daily living. Socialism did not fail, it was pride in socialism which did. Once pride was missing, there was an abdication of morale too. The east Europeans were hustled into choosing: they had stable prices, rationed food generally in reasonable quantities, ample clothing even though somewhat unimaginative in design and quality, housing of some sort. Moreover, they had full employment, generous social security arrangements, subsidised education and health care, and music and culture organised for the millions. They also had two-thirds of the Olympic medals. But they chose to be free. They have chosen galloping prices, steeply declining production, unemployment for 50 per cent of the workforce and social chaos.

Over here, we never built any socialist edifice, we have an impeccable feudal-capitalist order where controls only play a peripheral role, acting as some sort of a buffer between the pillaging few and the plundered millions. The shapers of our destiny are now being asked to be inspired by the example of Mikhail Gorbachev and withdraw whatever residual controls there are. Gorbachev, if the grapevine is to be trusted, will soon be confronted by the prospect of a 1000 per cent inflation per annum. Should they follow his example, our policy-makers, those who take office this week, would be unlikely to avoid a similar fate. It is going to be their funeral, why bother to intervene? Unfortunately, their misdoings will hurt most the innocent millions who trusted them with their votes.

What Is Happening to Farm Investments?

Arun Ghosh

Now that there is a new government at the centre, it is time somebody drew attention to the long-term problems we are inviting upon ourselves by continuing to pursue the policies of the eighties. Neglect of farm investments is among the most ominous of these.

THE Reserve Bank of India *Bulletin* of May 1991, read in conjunction with the RBI *Report on Trend and Progress of Banking in India* (July 1989-June 1990), makes distressing reading. Even as the Planning Commission is reportedly preparing a draft Eighth Plan on the assumption of a 6 per cent rate of growth of the economy over 1990-95, and business and economic writers are up in arms against the admittedly draconian (but inevitable) monetary curbs against imports, there has not been a murmur about the continuing, distressing trend of a decline in investment on the farm.

Now that there is a new government at the centre—which will obviously have to face the immediate problem of restoring some semblance of order in the balance of payments—with diverse implications for internal economic policy formulation, it is time that somebody drew attention of the intelligentsia to the long-term problems we are steadily and consistently inviting on ourselves by continuing to pursue the economic policies of the eighties. And the most significant change herein would pertain to the policy (or policies) we pursue in regard to agriculture.

But, first, we should make use of some telling figures brought out by the Reserve Bank. Let us first focus on the pattern of ownership of bank deposits in 1988, as per a sample survey conducted by the RBI. In 1988, individuals (including Hindu undivided families) accounted for 75 per cent of all deposits with commercial banks; and omitting non-residents, the percentage comes down to 67.

Individuals (or households), in both the national accounts statistics as well as banking statistics, are a mixed lot. The break-up of the pattern of savings by resident Indian individuals (including HUFs) is given in Table 1. For brevity, the corresponding figures for 1986 have been omitted, but it is important to mention here that the aggregate increase in bank deposits by farmers between 1986 and 1988 was as much as Rs 5,457 crore, which was 15.5 per cent of the total increase in deposits over the two-year period. Current deposits increased by only 1.1 per cent over these two years, sav-

ings deposits by 22.6 per cent and term deposits by 14.6 per cent.

Unfortunately, we do not have the maturity pattern of term deposits in respect of farmers specifically, but we do have such a break-up for 'individuals' (including HUFs) broken up as between rural, semi-urban and urban areas. These figures are given in Table 2. It would be seen that in the rural areas, deposits exceeding one year accounted for more than 96 per cent of all deposits; indeed, deposits exceeding three years were only a shade less than 70 per cent of total rural deposits.

While the scheduled banks may take justifiable credit for substantial deposit mobilisation even from the rural areas, the brief point is that farmers—obviously the affluent sections among them—put by most of their savings in the form of term deposits with commercial banks.

One should add that the data given in Tables 1 and 2 should not be mixed up. In the former, the classification is between

farmers and other kinds of deposits; in the latter, the distinction is between rural, semi-urban and urban areas. The only thing one can say for certain is that in the rural areas, a large proportion of the deposits would be by farmers. (Term deposits by farmers were Rs 8,434 crore; term deposits in the rural areas totalled Rs 9,429 crore.) It would appear that affluent farmers have now taken to keeping their surplus funds in the form of 'financial assets' rather than investment on farm improvement.

One further set of statistics from the RBI *Bulletin* may be adduced here, the statewide break-up of deposits. Unfortunately, these data are available only in respect of 'individuals' and are not broken up as between different categories of individuals. However, it may still be useful to cite these data, to indicate the changing 'asset preference' pattern of individuals (including HUFs) in the country. In Table 3, non-resident deposits have been specifically deleted to indicate the pattern of regionwise deposits held by individuals in commercial banks. (Data are available statewide but are not being given here; they are not really germane to the issue, except for a few states which are specifically mentioned below.)

Two clarifications are necessary. First, and importantly, the total of the deposits of individuals tells us very little of statewide (or regionwise) deposits from the farm sector or even from the rural sector. One could, of course, attempt a segregation of individuals' deposits in large metropolitan areas (for which data are available) but, even so, the data cannot be equated to the rural sector. Secondly, in some states, non-resident deposits are quite high (In Kerala it is 27.6

per cent of the total, in Maharashtra 21.6 per cent, for India as a whole 8.3 per cent.)

But, then, why have we presented the data given in Table 3? The relevance of the above data is to compare the proportion of individuals' deposits in states like Punjab and Haryana (between 84 and 85 per cent of the total) with those in Bihar (75 per cent), UP (also 75 per cent), Andhra Pradesh (76 per cent) and Orissa (69 per cent). That is, it is not merely the affluent states where this phenomenon is observed but also the less developed states. (Of course, we have no means of knowing what part of the deposits of individuals in these states emanates from the non farm sector.)

Before we pass on to the main purpose of this study, namely, to indicate the pattern of bank lending to the farm sector, it must be added that, as of today, one of the sectors of the economy wherein there is a large backlog of demand is the tractor industry and other (modern) farm equipment. Apparently, in the 'affluent' farm areas where holdings are large, there is adequate money to spare for holding financial assets (in considerable measure) in addition to making farm investments. It is difficult to envisage any large demand for tractors in areas where operational holdings are small.

The point that is relevant is that this backlog of demand for tractors may not reflect the situation (in respect of investment in farm improvement) in the country as a whole.

Let us take a look at the 'financing' of the farm economy by the banking sector and the co-operatives, which together make up the organised lending sector. Are we having a reverse transfer of savings from the rural to the urban areas? That, in fact, is the question we need to ask ourselves.

And here we run into difficulties. The RBI *Report on the Trend and Progress of Banking in India* devotes much attention to the number of branches opened (in rural and other areas) but it gives no data in regard to the actual finance provided for the agriculture sector, not even on an all-India basis, let alone for each state. (Statewise data on lending is available for the RRBs, but we can leave them out of reckoning as they provide only a very small part of finance in the rural areas.) Much has been written about the Service Area Approach, but perhaps it is too early to get any feel of what it has achieved. The only data we have pertain to the outstanding amount of credit to the farm sector. Obviously, it would be quite wrong to take even the data pertaining to short-term credit advanced to agriculture, which is what we can obtain from the data on 'advances' to, and demand for recoveries as well as actual recoveries from, the farm sector.

The *Currency and Finance Report* gives better information, fortunately, and we have here three sets of data: (a) short term advances to agriculture (by size of holding and by state); (b) loans and advances made by primary agricultural credit societies; and (c) advances by land development banks and

The total loans and advances to agriculture during July 1987 to June 1988 amounted to Rs 1,273 crore, but these are essentially crop loans, supposed to be reimbursed within a year. (The outstanding amount was Rs 6,017 crore, at the end of June 1988, but that is a separate matter.) The amount advanced by primary agricultural credit societies during the year was Rs 3,688 crore, this amount has to be added to Rs 1,273 crore advanced by the commercial banks, to indicate the total short-term credit available. (Again, the outstanding amount of Rs 5,242 crore does not concern us here; and may be likened to bank funds locked up in sick industrial units.) The total short-term credit to Indian agriculture, from 'organised' sources is seen to be only Rs 4,961 crore during 1987-88. This is a digression, but a worthwhile one.

But these loans are not made for farm investments (though some part of commercial bank credit to the farm sector could well be for that purpose). The state land development banks lent a total sum of Rs 190 crore during 1987-88, and the primary land development banks an amount of Rs 356 crore. There may be some double-counting involved here (through refinancing) but even

discounting this possibility total lending by land development banks (for farm improvement) amounted to no more than Rs 544 crore. That is as far as we can get, with data from the *Currency and Finance Report*.

Again, the RRB data given in the *Currency and Finance Report* pertain only to outstanding and overdue advances. We know that the entire lending by the RRBs was not for farm improvement; nonetheless, it is significant that the outstanding advances by the RRBs, as at the end of December 1989 amounted to only Rs 2,939 crore.

Two conclusions follow. First, the data on lending for farm improvement are hard to come by. It would be wrong to mix up the scheduled banks' crop loans to the farm sector with loans made specifically for farm investment—the former are essentially current working capital loans, and what we are seeking is the type of assistance rendered to industry by the IDBI, ICICI, IFCI et al—and while loans advanced by the land development banks may be so characterised, lending by commercial banks cannot be so defined. The total amount of lending of the land development banks is so small as to warrant them being left out of consideration for present purposes.

TABLE 4 DRAWALS AND OUTSTANDING IN RESPECT OF MEDIUM AND LONG TERM LOANS BY NABARD

| (Rs crore) | | | | | | |
|------------|--|-------------|--------------------|-------------|------------------------------|-------------|
| Year | State Co-operative Banks (medium term) | | RRBs (medium term) | | State Government (Long term) | |
| | Drawals | Outstanding | Drawals | Outstanding | Drawals | Outstanding |
| 1986 | 1374 | 3434 | | | | |
| 1986-87 | | | 9432 | 19926 | 1227 | 9516 |
| 1987 | 1303 | 3118 | | | | |
| 1987-88 | | | 4318 | 20308 | 8840 | 16884 |
| 1988 | 1018 | 2705 | | | | |
| 1988-89 | | | 6025 | 24039 | 4522 | 19523 |

There remains the National Bank for Rural and Agricultural Development (NABARD) and perhaps this is the only source of whatever data we have in regard to the financing of rural development. The NABARD refines state co-operative banks (for short- and medium-term credit) and state governments for long-term credit. Let us take a look at the total medium- and long-term credits refinanced by the NABARD, as per its annual report for 1988-89 (Table 4).

The figures of conversion of short-term loans into medium-term loans in scarcity affected areas have been ignored in the above statement because these are not for farm improvement but are much like the *saccavi* loans of a bygone era.

If we forget the difference between calendar years and fiscal years, the total of medium- and long-term loans to the farm sector would be something like the following:

TABLE 5 TOTAL OF MEDIUM AND LONG TERM LOANS REFINANCED BY NABARD (Rs crore)

| | |
|---------|--------|
| 1986-87 | 12 033 |
| 1987-88 | 14 468 |
| 1988-89 | 11 565 |

The above are somewhat more respectable figures than those available from other official sources. But then, we saw at the outset, in Table 1, that during 1987-88 (July-June), the total savings and term deposits of farmers with scheduled commercial banks alone were Rs 5,717 crore and Rs 8,434 crore respectively, or a total of Rs 14,151 crore during 1987-88. We have not even counted other types of financial assets which the affluent farmers are now beginning to acquire.

The pertinent questions to answer then are (a) do we have data on the total investment on farm improvement? (b) who is financing investment on the farm and how? and (c) can we improve the statistics relating to the flow of funds from and to the farm sector, at least insofar as the organised financial institutions are concerned?

One wonders whether the National Sample Survey (NSS) can take on such a study in one of its rounds.

Finally, given the existing crunch of resources, the need for restraint on credit generally (to avoid inflation), and the fact that investment in farm improvement (not

necessarily in modern farm equipment) is not likely to have any adverse impact on the balance of payments, one can only suggest, for the consideration of the new government, that (a) there is a case for increasing the allocation for farm improvements, particularly in the dryland/desertified areas, (b) there is every advantage in converting all current transfers to the rural sector (like the JRY) into 'investments', and (c) this can be done only by decentralisation, the transfer of Centrally-Sponsored Schemes to the states on condition that the funds are in turn passed on to locally elected panchayats, voluntary and other agencies (like the SPWD) working in rural areas, so that we can improve rural incomes and output without any adverse impact on the balance of payments.

Perhaps a final word is necessary. It could be argued that direct investment in agriculture (without financial intermediation) is taking place, on a big scale. Table 6, taken from the *National Accounts Statistics (1990)*, indicates the gross fixed capital formation in agriculture (including direct investment in the form of fixed assets) from 1980-81 until 1987-88, at both current and constant (1980-81) prices.

Two points emerge from the above table. At current prices, the gross fixed capital formation in agriculture in 1987-88 was way below the total of medium and long-term loans refinanced by the NABARD (see Table 5). This implies that a large part of NABARD refinancing either went to sectors other than the farm sector (with which we are concerned here) or else there was considerable diversion—apart from the

possibility of statistical errors, which cannot be of this order—of NABARD financing, meant for agriculture, but really going for uses other than those intended by NABARD.

More importantly, at constant prices (with 1980-81 as the base), gross fixed capital formation in agriculture declined from Rs 4,537 crore in 1980-81 to Rs 4,197 crore in 1987-88, the decline being particularly noticeable from 1983-84. This figure is inclusive of direct investment.

The implications for policy for the new government are obvious, though what will really happen is not so clear. The entire thrust of the World Bank/IMF (as seen from the recent debate in the columns of *The Economic Times* on the latest World Bank report on the need for trade liberalisation in India) is on (a) trade liberalisation, and (b) a sharp reduction in the fiscal deficit (which somehow has been linked, almost in a 1:1 relationship, with the deficit in the balance of payments). The helplessness of a new government, in urgent need of temporary balance of payments relief, can be imagined. The World Bank recommendations merit a separate discussion. But let it be stated here that the focus of the new government *should* be to step up investment for rural development generally and agricultural development in particular. Neither the Bank nor the Fund appear to be overly concerned with the development of the one sector which has no adverse balance of payments implication, and which provides livelihood to some two-thirds of the Indian population.

Power-Shift

Bhabani Sen Gupta

The aftermath of the election has left all parties, except the BJP, exhausted in body and mind. The Congress(I) is ready to fade away as the leading political force between now and the next election which is probably only three years away. The leaders of the Janata Dal are torn between Mandal and the middle classes. The Left too is passing through a spiritual crisis. But in great contrast to the dilemmas in the camps of the secular parties is the climate in the BJP which, after scanning the election results, has come to the conclusion that the mood of the people is with it.

THE tenth general election, the longest, the most expensive and the most traumatic in India's history since independence, is conspicuous for the contradictions and warning signals it has delivered. First, there is a minority Congress(I) government in Delhi which does not represent the ground realities of political power thrown up by the poll. It governs only one State in the north, Haryana, two in the south, Andhra Pradesh and Karnataka, Maharashtra in the west, and Kerala in coalition with a gaggle of other parties, and Assam in the east together with the cluster of six mini-States.

The Congress(I) power base in the entire Gangetic valley has been virtually wiped out. Its unrealistic strength in the Lok Sabha is the gift of an assassinated Rajiv Gandhi who, alive, could hardly have shored up as many seats. As Indira Gandhi gifted to her son, Rajiv, a Lok Sabha with an over two-thirds majority by dying at the hands of two Sikh assassins, so did Rajiv Gandhi bestow on his party a near-win in the election by getting killed by a suspected LTTE assassin.

Rajiv Gandhi's gift is much smaller than what he had received from his departed mother. Even with that brute majority in the Lok Sabha, he could not press the political-economic system to desirable change, and lost the poll of November 1969. The Congress(I) is ready to fade away or collapse as the leading political force between now and the next election which is probably only three years away.

The winner in the tenth general election was the BJP, though it came second. In a matter of just two elections, BJP has spread its saffron wings over vast expanses of the country, from north to south, east to west. It is the principal ruling party in northern India while, on the west coast, it has Gujarat in its net. Himachal Pradesh, Rajasthan, Madhya Pradesh, Gujarat, Uttar Pradesh—one-half of

India in territory and more than that in population—lie in the grip of BJP political power.

Down south, BJP got 29 per cent of the votes cast in Karnataka compared to a mere 3 per cent in 1989, while in Andhra Pradesh, where it had formidable rivals in the Congress(I) and TDP, it snatched away 9 per cent of the votes. Even in West Bengal, the Marxist citadel, BJP collected 12 per cent of the votes though without winning any seat. There is hardly a State or territory in India today where the BJP is not seen as the party of the future. It has snatched away the government of Uttar Pradesh with 23 per cent of the votes, as against just 11 in November 1989. With 119 MPs in the Lok Sabha, BJP is the main opposition party. But when you note that in as many as 128 constituencies the party came second, you are compelled to concede that there is a lot of reality in the BJP claim that it is 'the government-in-waiting'.

The Janata Dal defended Bihar stubbornly and well and came up as the second force in Uttar Pradesh, while it also held Orissa. But its rout in the rest of the country, in Gujarat and Karnataka particularly, showed that the cry of equity and social justice, holding aloft the flag of the Mandal report, did not draw the voters in most of India to vote for its candidates. The Left Front lost Kerala. Its fourth time running win in West Bengal was remarkable, but there was a drop in its popular vote, and even four CPI(M) ministers were crushed. Among the regional parties, AIADMK triumphed in Tamil Nadu, cashing in fully on the sympathy wave, TDP showed an impressive recovery in Andhra Pradesh and might have come out on top if Rajiv Gandhi had not been killed, but the Asom Ganatantra Parishad, split as a result of internal strife, lost miserably to the Congress(I) and will find it hard to bounce back to power.

GLOOMY PROSPECT

It is the state of the Congress(I) that provokes gloom about the future of traditional Nehruvian secular politics. Organisationally it is still in the grip of the coterie whose current slogan is 'the dynasty is dead, long live the dynasty'. By succeeding in installing P V Narasimha Rao, who is more sickly than 70 and has been a faithful loyalist all through his shineless political career, as both party president and prime minister, the coterie has ensured that there is no significant change either in the party organisation or in the policies and programmes of the government. There are, of course, rumblings of discontent, fear and infantile protest in the Congress(I) leadership. Sharad Pawar's challenge to the coterie lost its breath in no time, but he has cleverly installed himself as the alternative centre of power in the Congress(I) apparatus in Delhi, while the resignation of Shiv Shankar as leader of the party in the Rajya Sabha has revealed only the tip of an iceberg of potential rebellion against the coterie-Rao leadership.

However, the history of the Congress Party is not exactly littered with instances of rebellion, and there has been perhaps only a single successful rebellion in its 100-odd years of history when Chittaranjan Das and Motilal Nehru broke away from the party in the 1920s to form the Swarajya Party. It required a man like Mohandas K Gandhi to acknowledge his defeat and woo Das and Motilal back into the party. In the late 1930s, Gandhi ruthlessly broke the back of the rebellion of Subhas Chandra Bose, with the backing of Jawaharlal Nehru. The Congress(I), as the inheritor of the Indian National Congress tradition, is steeped in the parent body's culture of open submission and secret conspiracy.

The aftermath of the election has left all parties except BJP exhausted in body and mind. The prime minister is busy carpentering a government that can win the Lok Sabha's vote of confidence and survive the political turmoil that will inevitably follow the acceptance of a large IMF loan with all its conditionalities. He has not taken the country into confidence until now about anything that is really important: whether he is anxious to build, and is capable of building, a consensus with the opposition parties on how to handle the grave foreign exchange crisis, how he is going to live with the minority status of his government, what his perceptions of India's political future are, whether the Congress(I) will be willing to work with the National Front and the Left.

poll. There are no answers to these questions from Rao or any other authoritative source in his party, nor to the question whether the party is to be rebuilt through organisational election and, if so, how soon.

The coterie continues to plumb for Sonia Gandhi as party president, in which case there will be a situation of the *status quo* reinforced. The prime minister, never known for conceptual clarity or political initiatives, and for long politically homeless in his own State, has adopted the policy of enigmatic silence and passivity, which may be caused by unsound health, poverty of ideas and the large debt he owes to the coterie for making him what he is today in the twilight of his life.

The Janata Dal has taken painful stock of the post-election scenario. Its leaders are torn between Mandal and middle class as if there were a basic contradiction between the two. Holding Bihar was nice, but Laloo Prasad Yadav believes more in Yadav power than in the power of the OBCs, has done nothing to redress the pitiful condition of the poor and the deprived nor for Bihar's economic uplift, and so Bihar is not a State you can hold up to the country as a model of your political philosophy. Besides, the Janata Dal is the epitome of the lust for power of Indian political leaders; it can never be certain that its major factions will stay together under a single flag. It was broken and thrown out of office by the desertions of Devi Lal and Chandra Shekhar. Even now, Delhi is agog with rumours that Ajit Singh may any time swallow the bait held up to him by the plumbers of the Congress(I): the industry ministry, if you can defect with a full third of JD's strength in the Lok Sabha.

This move, if true, also betrays the total poverty of political leadership in the post-dynasty Congress(I). Once it begins to play the dirty and corrosive game of defection, it will lose whatever little credibility there is now in the prime minister as a political leader, and throw its own flanks open to similar moves by party dissenters. In any case, if the government determines that it can survive only with the defection of a faction in the Janata Dal, it will shut the door on future collaboration among the secular parties to hold the saffron tide and to roll it back when the country goes to the poll again well before 1995.

The Left Front too is passing through a spiritual crisis. The loss of Kerala reduces the Left Front to an entity that rules only one State, West Bengal, in which the State CPI(M) leaders are not always in tune with the central committee and politburo leaders in Delhi. The CPI has not been able to expand its electoral base in Bihar and Uttar Pradesh and

CPI(M). The CPI(M) is tantalised by opportunities of finding an ally in the Congress(I), which was its long-time objective, but it is wary about giving up its linkages with the National Front. On the whole, however, the CPI(M) and the CPI are the only two groups who will try to persuade the Congress(I) and the National Front in the months to come that in the new power-shift in India the three groups must work together to save and protect Nehruvian socialism and secularism. The Marxists have pipelines both to the coterie and the dissenters in the Congress(I) as well as to Narasimha Rao who stands somewhere in between, his kurta-tails clutched strongly by members of the coterie so that he may not get out of their grip.

THE CONTRAST

In great contrast to the dilemmas and despondencies in the camps of the secular political parties, there is a different climate in BJP. BJP leaders have scanned the election results most carefully and come out with the strong as well as weak points of their party's performance. They have come to the central conclusion: the mood of the people is with them. Not just because BJP built a big agitation for the Ram temple, but because the voters all over the country see it as a well-knit political party, with clear and candid policies which often promise an entirely new direction to Indian polity. Its leaders are seen as united in political will and strategy and quite serious about what they say. BJP leaders are not unhappy that the party has not done even better. In private conversation, they concede that they are not ready at this time to govern India. They must erase from the people's mind the image of a Hindu chauvinist party determined to turn India into a Hindu 'rashtra' and reduce the 100 million Muslims to the status of second-rate citizens. They declare that elected to power they will not try to dissolve the first republic and set up a second republic with Hinduism as the State religion. "We will maintain the republic as it is crafted by the Constitution. We will not set up a theocratic State", asserted a BJP leader in a recent conversation. "We will give the Muslims security and equal status as citizens, with no special privileges and no particular disadvantages."

BJP leaders know that two years of atavistic agitation have darkened the minds of its many supporters with rabid anti-Muslim sentiments. The use of obscene political cassettes in the election and the role played by such lumpen bodies as the Brajrang Dal and to a lesser extent VHP are leftovers of the election which the BJP will want to garbage in the years between now and the next poll.

A team of young men who managed

efficiency from the central office in Delhi have found that the party received the support of all segments of Indian society—from the affluent to the poor, brahmins to sudras and tribals, urban as well as rural folk. This broad acceptability of the voters has kindled confidence in the minds of the BJP leaders that the next election will catapult it to the centre of national power.

Meanwhile, it must govern Uttar Pradesh well and do better in Madhya Pradesh, BJP leaders add. "We have to give better performance as administrators and developers of the economy. We have to show that the Muslims are safe in States we govern—particularly Uttar Pradesh, which is almost impossible to govern."

It will take the BJP leaders time to convince the mainstream of the Indian population that it does not stand for a Hindu 'rashtra' nor for politicised Hindu nationalism. BJP's principal capital is the poor state of its political opponents, above all the bleak future of the Congress(I). Released finally from the domination of the dynasty, Congressmen and women should grasp new opportunities to rejuvenate the party through organisational election and churn out new ideas to deal with the new social and political realities in India and the world in the 1990s. Even if many party leaders recognise the need, few are capable of summoning the political courage to demand constructive change. The 26-year old mind-set, spanning an entire generation, of supine subservience to a supreme leader has drained the spirit of democracy from the arteries of most Congressmen and women. They have been hugely diminished as political actors by Indira Gandhi and Rajiv Gandhi. Few leaders have secured support bases of their own; those who stood on their own support bases were pulled down by the supreme leader. Now the Congress(I) is a prisoner of the binds created by its leaders since 1969. If its leaders cannot cast away those binds, the party will be reduced to a pitiful minority in the next poll and then one day it will fall apart into many mutually warring pieces.

The kind of leadership, gifted with strength and vision, that can rescue the party from its present paralysis is not in sight, Sharad Pawar notwithstanding. This aspirant to the prime ministership is still to show that he has a vision of a go-ahead India, that he understands global change, and can mobilise manpower and other resources within and outside the party to build an India which is at peace with itself and on friendly terms with the neighbours and other foreign countries.

The Janata Dal is the first centrist party to commit itself to the backward castes' and classes' entry into the power structure

and to make equity and social justice its main political planks. Since caste and class mean in India almost the same thing, the Janata Dal might have broken the resistance of the power structure to significant social change. In the post-election meetings of the national executive of the party, it rightly decided not to depart from its basic political ideology but to make additional efforts to win the confidence of the middle and lower middle classes which it lost almost entirely as a result of the huge hue and cry that followed V P Singh's announcement of 27 per cent reservation of jobs in the Central government and its industrial and other economic undertakings for the OBCs. North Indian Hindu society will not easily allow political power at the national level to be meaningfully shared by the sudras and the tribals: this society's value milieu is still governed by brahminism of an ancient vintage. The brahmins deserted the Congress(I) in the last poll along with significant segments of other high castes, in Uttar Pradesh the Janata Dal was let down by its own constituency which it had to share with Mulayam Singh. The Dal and its Mulayam Singh break away faction together polled more votes than BJP. BJP then can be contained in UP only if the other parties come together in a vote sharing coalition bandobast.

This will probably happen on a national scale at the time of the next election if, as noted, the Congress(I) takes no attempt to break the Janata Dal but determines to work with it and the Left Front to resolve the pressing political and economic problems.

ECONOMIC CRISIS

The country has been debating economic policy issues for many years, but little has been done to make the structural reforms that are essential to impart growth wings to the economy. Two alternative approaches have been debated, neither has been undertaken. In the result, the Left democratic solvents have lost ground in view of the collapse of Left ideas on a global scale and the triumph of the new god called Market. The political economy remains frozen in the barren middle between the two as corrupt politicians and a politicised bureaucracy join hands with rapacious capitalists to plunder the wealth and resources of the nation. We have arrived at a stage when the political leadership can summon the courage neither to work for the Market nor for the People. Reckless spending of foreign exchange began during the Rajiv Gandhi years, in the brief National Front interlude, it was compounded by populist ideas like loan waivers. Now the country stands dangerously close to the debt trap

and *The Economist* of London gleefully forecasts that India's economy will soon be in the "safe hands of the IMF".

Since the economic crisis is part of the larger structural crises in the entire political economy, even a big IMF loan in itself will not be a solvent. The Congress(I) government will have to swallow many a stiff IMF conditionality. Implemented, some of these conditionalities will trigger social and political unrest. The minority government will try to backtrack from the reforms which will make the economic confusion only worse compounded. The solutions suggested by Left-democratic schools, like land reforms, a determined expedition against the black economy, taxing the rich more vigorously and introducing a tax on agricultural income will not be acceptable to the government, and it will probably never be that a Left democratic government will be in saddle in Delhi to give the political economy a Left-democratic direction.

It will therefore be futile to expect a national consensus to pilot India to a safer and better managed economic shores. The government will have to come out with its policies and come out it will gingerly in the budget and in subsequent coping measures. The opposition parties will not vote it out for two years. But BJP can be depended upon for formulating its political battles for the next poll even as

the country scrapes through its current economic tests and tribulations. It will not whip up strikes. It will not encourage agrarian unrest. Its main thrust will be to further the alienation of the middle class from the Congress(I).

BJP leaders realise that working class and peasants do not determine the course of Indian politics; the middle classes do. In the various central bureaucracies today one can hear a lot of support for BJP. Dozens of former military officers and retired ambassadors have joined the party. More will as time passes. More and more business houses are now veering towards BJP. More and more of the educated youth of the country too are inclining towards BJP as the party of the future. Among the intellectuals, the baggage of Nehruvian political philosophy has almost completely lost ground; the Market is becoming the Mantra.

The total mobilisation of all democratic and secular forces alone can contain the BJP wave. But there is no sign that such mobilisation will happen. The Congress(I) alone can take the lead. There is little sign of new life and stirrings in that effete and aged animal. Under BJP, India will be a very different political economy from the one the founding fathers contemplated, and which Nehru and his successors wanted to build but have painfully failed in their job.

WOMEN AND FERTILITY IN BANGLADESH

ALIA AHMAD

High fertility and declining mortality rates in Bangladesh have led to a high rate of population growth. This in turn has created conditions of dire poverty throughout the country because of the inadequacy of available resources to cope with the pressures of a burgeoning population. Unfortunately the officially sponsored birth control programme has had only modest success in tackling the problem of population growth primarily because it has not attempted to bring about qualitative improvements in the socio-economic conditions prevailing in the country. Since socio-economic change is a very broad arena, more focused and selective interventions are required to induce rapid changes in fertility behaviour. According to the author of this pioneering study the status of women is one such factor. Dr Ahmad maintains that suitable policies aimed at ameliorating the socio-economic conditions of women in Bangladesh can have a direct impact on reducing fertility rates. Based on in-depth interviews with a cross section of women, this book explores the links between the status of women and high fertility in Bangladesh.

This book will be of considerable interest to sociologists, economists, demographers and all those dealing with issues of gender and development whether in academic institutions or in the field.

Moment of Truth for Janata Dal

Anil Nauriya

The Janata Dal had raised expectations of a possible social and political transformation. Its electoral performance, and the political mistakes and miscalculations responsible for this, therefore evoke a sense of an opportunity lost. The situation is not irretrievable, however.

IF the Janata Dal leadership fails to read the writing on the wall after the general elections it will have fully deserved the oblivion that awaits it. At the time of its formation towards the end of 1989 the Janata Dal government reflected a ray of hope. The party had come to power with the promise of a new style of governance and there seemed to be an inclination on its part to direct its programmes towards securing the primary needs of the people. The hope diminished within a relatively short period of the party's administration; now the Janata Dal itself has been reduced to a political rump comparable in insignificance to the group that split away from the party in October-November 1990.

The party leadership must re-examine the performance of its government at the Centre. After the Janata Dal government assumed office, there was a feeling among observers that the party did not have the organisational base that was required to lend political support to the action plan which it had in mind. This meant essentially two things. First, the Janata Dal did not have an organisational base appropriate to the kind of programmes it had contemplated. And second, that the party did not have an adequate organisation of any kind.

The Dal failed at this point also to evolve a formal decision-making structure both within the party and as between itself and its supporting parties. There was a lack of clarity among the senior leaders about methods of functioning. This was compounded by ideological confusion within the party.

To deal first with the method of functioning, it is well known that even senior leaders of the party did not have an indication of the timing of specific political initiatives. The leaders had an approximate notion of the weapons in their political armoury; they did not know which device would in fact be utilised or when it would be used. There was no policy planning and no prior consultation in strategy and tactics. It is futile to complain that faction leaders functioned as though they knew no discipline. There was

nothing unexpected in this. The experience of the post-1967 non-Congress governments in the States and at the Centre during 1977-79 should have been warning enough. The manner in which Devi Lal was used, propped up, and periodically appeased and the handling of the Meham electoral controversy were entirely unsatisfactory. But there appeared to have been a willingness on the part of public opinion not to hold this against the Janata Dal government as a whole.

If a turning point is to be identified in the fate of the Janata Dal government, it is perhaps the decision to bring in Sanjay Singh, a relative of V P Singh, as a member of the Rajya Sabha from Uttar Pradesh. This was done in disregard both of the serious criminal case against Sanjay Singh and of the fact that his political record was none too glorious. This decision, much though V P Singh may attempt to disown it, affected his moral authority. V P Singh, who had till then acted as an umpire in inter-factional controversies, was now seen rightly or wrongly as being an active participant in the unprincipled politics to which he had been presented as a contrast. Devi Lal was now emboldened to attempt reintroducing his son as chief minister of Haryana, setting in motion a chain of events that led to the removal of the deputy prime minister from the Union government.

Having removed his deputy, V P Singh panicked again, apprehending a reaction in the north Indian countryside. The manner in which the Mandal Commission recommendations were sought to be implemented was of a piece with this. A reasonably strong case, subject to certain modifications which required to be discussed, was thus tainted by the vice of a stratagem.

LOHIA MISUNDERSTOOD

Difficulties arose on account of the adoption of ideologies without adequate preparation or understanding. In regard to what is passed off as the ideology of Ram Manohar Lohia, V P Singh dis-

played all the zeal of a new convert. As often happens with new converts, the dominant church is mistaken by them as the sole interpreter of a prophet who they themselves do not yet know well or at all. Ideological weaponry when used casually can and often does backfire. Lohia has left two legacies which, though connected, are substantially different from each other. The first is represented by his writings which are important and thoughtful attempts to understand Indian social and political reality. The other legacy is represented by his politics, especially in the latter part of the fifties and in the sixties. Lohia is better known to fellow Indians by the second of his legacies. Those who are known today as 'Lohiawadis' originated in this politics; yet many of them had been evolving ideologically over the last several years in a manner that not only brought them closer to the first legacy but also took them considerably beyond it.

The Janata Dal leadership failed to grasp this. Lohia ideologues of long standing, like Kishan Patnaik, have for several years been speaking of the need to grow out of a rigid and static approach to Lohia.

A risk inherent in the phenomenon of a leader who suddenly assumes control of a party or a movement and aspires to become the custodian of its ideological heritage is that he is not fully aware of what has gone before him. Thus if persons adhering to a particular ideology have evolved in a natural manner from point A to point X, the new leader compels them to make an artificial and wasteful return to point A so as to begin the process of evolution again.

'Lohiawadi' socialists held important positions and exerted influence at all levels within the Janata Dal. But they did not have a sufficiently critical attitude towards V P Singh. Their political pride was propitiated by the obeisance that Singh performed at the ideological altar of their socialist messiah. Thereafter he was given, in the current metaphor, rein of the 'Lohiawadi' chariot.

When the anti-Mandal agitation got going these socialists were not able sufficiently to impress upon V P Singh and upon some of their enthusiastic mutual colleagues that Lohia himself had a composite view of social backwardness. In his concept of backwardness there was place for economic and other components besides caste. In addition, Lohia had included women, in this category. The Karpuri Thakur formula for reservations in Bihar had been a comprehensive reflec-

tion of these criteria. It also contained certain safeguards to ensure that the bulk of the reservations would not be cornered by a few dominant castes. For unexplained reasons, it had not been adequately considered in the Mandal report. Instead of urging V P Singh to be more flexible so that a national consensus could be created around an acceptable formula, the Lohia socialists, and surprisingly even some sections of the communist parties, encouraged a rigidity about the Mandal formula. Irrelevant arguments were floated and repeated *ad infinitum* about how the Mandal formula identified castes also on an economic criterion. This was entirely beside the point since caste remained the sole criterion for reservations under the Mandal scheme. Technical arguments were adduced about the constitutional permissibility of the reservations contemplated. Throughout the Mandal-related crisis attempts to impress upon the Janata Dal leadership that the Karpuri Thakur formula, which was also a product of the 'Lohiawadi' ideology, and was a more composite and acceptable basis for reservations, met with failure. The leadership seemed so carried away with its own counsels that it was impatient with any suggestion for an alteration in the Mandal approach. This may or may not be the way to run a little fiefdom. It is hardly the way to run either a country of continental dimensions or a major political party in a democracy.

The Janata Dal leadership has been slow to admit errors. Soon after his government fell in November 1990, V P Singh, while talking to a group of citizens, refused to admit even the possibility that he may have been mistaken in not reviewing the Mandal criterion.

NEED TO BROADEN APPEAL

The leadership must now seriously ponder the future role of the Janata Dal. It is natural for Ram Vilas Paswan and others to suggest that V P Singh has become a symbol of the aspirations of the poor and will remain identified as such as also the leader of the party. It is always tempting to suggest, when faced with a difficult moment calling for introspection, that what is required is simply more of the same disastrous policy that has so far been pursued. The first response of the leaders of the Bharatiya Janata Party to their electoral defeat in a State like Madhya Pradesh was merely to suggest that more work required to be done along the same lines as before. Such responses are directed less to understanding the facts on the ground than to justify positions already taken.

George Fernandes went on record to

Institute of Public Enterprise

OSMANIA UNIVERSITY CAMPUS
HYDERABAD 500 007 INDIA

Institute of Public Enterprise is interested in recruiting 3 Research Associates in the age group of 20-30 years to participate in research activities, prepare teaching material and provide teaching assistance in the areas of State Level Public Enterprises, New Financial Instruments and Public Enterprise Finance and Accounting

Candidates for the posts should have a Master's degree with a high second class in Business Management/Commerce/Economics/Banking. They should have completed their research for M.Phil. or equivalent degree. Those who intend to register for Ph.D degree in research areas mentioned can also apply. Such candidates will be encouraged to pursue their doctoral work at the Institute under the supervision of Faculty. The candidate selected for the post would be paid a consolidated salary of Rs. 3000-100-3500 per month subject to their performance. The appointment would be for a period of two years. Application on plain paper stating educational background, academic distinctions, work experience, list of publications, names of two referees and other information should reach **T.L. Sankar, Director, Institute of Public Enterprise, O.U. Campus, Hyderabad-500 007** within one month from the date of publication of this advertisement.

say, somewhat before the election results came in, that the Congress had no right to exist. This was reminiscent of the Communist Party's attacks on the pre-1947 Congress before it developed the machinery to replace it. That is to say, it was premature.

It is to the building up of such a machinery that the Janata Dal leadership could profitably now devote itself. Given the experience since 1989 there will be a tendency within it to seek to build an alliance in the Lohia-Ambedkarite mould. With the Congress having become identified, especially in the years since the Emergency (1975-77), with varying forms of elitism, there is a need for a national party that would speak for and protect the interests of the poor. But an Ambedkarite platform is precisely what would set limits to the growth of such a party. Elitism or a mix of elitism and casteism cannot be answered by counter-casteism. This is not to belittle the role of Ambedkarite organisations. They perform an important and critical task in conscientising the Dalits and will be necessary allies in any struggle on behalf of the underprivileged in India. But an exclusive platform can hardly ever be at the centre of a national consensus. It is only an all-embracing outlook that can provide a party with a national base extending to all communities.

That incidentally is precisely the subtle distinction between the Karpuri Thakur formula and the Mandal approach to reservations. While the former can provide a basis for a national consensus, the latter can perhaps never do so.

Any party making use of the Ambedkarite and 'Lohiawadi' ideological legacies must, if it wishes to govern, dilute some of its ideological concentrate to such a point as enables reasonable persons across most classes and communities to agree on the national agenda. This is, of course, not a fixed point on the political or social spectrum. It is, within limits, a moving one, likely to be affected by political and historical moments and continually determined also by the quality of the leadership.

The course that Paswan and others have charted for the Janata Dal can, however, lead only to the building up of a magnified version of the Bahujan Samaj Party. This approach reduces the Janata Dal's ability to intervene positively in diverse spheres of national activity. For example, what sort of trade unions would such a party be affiliated with? Would such a party adequately reflect the aspirations of the industrial working classes or would it simply split the working class by introducing outmoded quasi-feudal divisions in it? It is no accident that the issues which V P Singh and his party had initially

raised—like the question of workers' participation in management and the right to work—got superseded by or transmuted into the debate on reservations. This reflected on the one hand the inability of the V P Singh government to implement these promises and on the other the inadequacies, and the particular composition, of its political base. Some indications of this were available at least as early as 10 months before the V P Singh government assumed power in 1989. On being asked repeatedly to spell out its ideas on the question of workers' participation in management, the Janata Dal leadership avoided being pinned down. The same thing happened with regard to the 'right to work' after the government was formed.

AMBIGUITY ON COMMUNAL QUESTION

The party needs to improve public confidence also in respect of its record on the communal question. It flirted with the BJP in the general elections in 1989. The Dal leadership did not come clean on this issue, with V P Singh repeatedly ducking questions. As a result of the adjustments then made, the BJP romped home in large numbers on a 'wave' which was not of its own making. It entered parliament with the full knowledge that thousands of persons, including those from the minority communities, had voted for it only because of its adjustments with the Janata Dal.

Having grown under the permissive shadow of the Janata Dal, the BJP set to work on strategies that would enable it give yet another twist to the communal spiral. After the further course of events both enabled and induced the BJP to launch itself in the infamous Rath Yatra, it was obvious fairly early that communal tension and violence would follow. Curfew had to be imposed on scores of towns across the country. While V P Singh is free to claim that his government fell as a result of the arrest of L K Advani leading the Rath Yatra, there is much substance in the criticism that the government had abdicated its responsibility by not acting earlier.

Finally, in the pre-election manoeuvres in recent weeks the Janata Dal leadership has not hesitated in making opportunistic and entirely unnecessary overtures to communal elements in the minority communities. This has not only given a handle to the BJP which has benefited from the political spaces provided to it by the opportunistic policies of the non-communal parties, but has also lowered the Janata Dal leadership in public esteem.

Has the Janata Dal then received its just deserts in the recent elections? In spite of

its numerous mistakes it is difficult to answer this question in the affirmative. The Janata Dal had raised expectations of a possible social and political transformation; its electoral performance must necessarily therefore evoke a sense of an opportunity lost.

If the Congress, the other major non-communal formation apart from the communist parties, does not return to a democratic style of politics after the assassination of Rajiv Gandhi, there will be added reason to regret the decline of the Janata Dal.

On account of control by an unrepresentative and irresponsible coterie, the Congress had ceased to be a democratic organisation; partly for that reason it had ceased also to reflect the aspirations of India's poor even to the limited extent to which it had in the past.

Until the emergence of the Janata Dal it was difficult to identify a major political party on the national scene, the communist parties excepted, which could speak for the underprivileged. If this hope, now almost stifled, is to be revived, the dominant 'Lohiawadi' church in Janata Dal Party, and not merely V P Singh, will have to do some serious rethinking. It is not that 'Lohiawadi' approaches need to be discarded; what is perhaps required of the Janata Dal is better 'Lohiawad'. The Janata Dal needs to correct itself also by infusing its dominant ideologies with a broader and rationalist temper. This should be relatively easy for the socialists among them who have, apart from the legacy of Lohia, other intellectual resources, such as those of Narendra Deva, also to draw upon. This would in addition help retrieve the heritage of Narendra Deva from any discredit by association that may have been brought upon it by the politics of Chandra Shekhar's party.

On its capacity for self-correction will depend the Janata Dal's potential as a powerful national party in defence of India's depressed classes. The base for this in the form of a strong National Front-Left Front combination is still in existence. It is to be hoped that this at least will not be squandered away.

Congress 'Grief' Takes Terrible Toll

Rajiv Gandhi's assassination provided a handy excuse for Congress(I) heavyweights, including ministers and MLAs, to organise loot, arson, murder and general lawlessness in Tripura. The partisan forces of law and order merely looked on.

ALMOST as soon as news of Rajiv Gandhi's assassination reached Tripura, there was a steep rise in poll related violence in the State. Predictably, the CPI(M) had to bear the brunt of the Congress(I)'s 'grief' though other political opponents of the Congress(I) in the battle for the two Lok Sabha seats in the State were not spared either. Anti-social elements owing allegiance to the Congress(I) swung into action so swiftly and so methodically against their party's political adversaries on hearing of Rajiv Gandhi's death that it seems difficult to accept the view that the violence which rocked Tripura was a spontaneous expression of the grief and anger of Congress(I) supporters. Indeed, it is not at all unlikely that the violence was pre-planned and would anyway have been unleashed against the opponents of the Congress(I) in the Lok Sabha elections originally scheduled to be held on May 23. Rajiv Gandhi's death merely provided an excuse for loot, arson, murder and general lawlessness under the leadership of Congress(I) heavyweights including ministers and MLAs. The police, the paramilitary forces and the administration were, by and large, reduced to the role of spectators. Though grief was the ostensible excuse, the main aim of the Congress(I) was to eliminate all opposition.

It may be recalled that the Congress(I) had gone on the rampage in Tripura after Indira Gandhi's assassination. Then also the CPI(M) was its primary target but the situation was promptly brought under control by the then Left-Front government of the State. This, unfortunately, has not been the case this time.

There were sporadic instances of violence in Agartala on May 21 itself. Houses of CPI(M) supporters were set on fire and tension mounted in the city as news of Rajiv Gandhi's assassination spread. A red alert was sounded in Agartala and Section 144 was clamped on the city on the night of May 21 as a precautionary measure. The army and the BSF were alerted and Assam Rifles assumed the responsibility of maintaining law and order in the capital. However, on May 22, violence spread throughout the State. Ignoring the restrictions imposed under Section 144, Congress(I) anti-

socials let loose a reign of terror throughout the State, looting property, setting houses and business establishments on fire and destroying CPI(M) party offices all over the State. The CPI(M) district committee office and the CITU office located at Battala in the centre of Agartala were attacked, ransacked and set on fire. Eight cars belonging to the CPI(M) which were parked in front of the district committee office were also set ablaze. Several booth committee offices and offices of some frontal organisations of the party were ransacked and burnt. The houses of many CPI(M) supporters and office-bearers also came under attack. Many of these victims of violence fled their homes and took shelter in jungles to escape the wrath of the Congress(I) hoodlums. The office of *Dainik Sambad*, a local newspaper edited by Bhupen Datta Bhowmik, an independent candidate pitted against Congress(I) candidate Santosh Mohan Deb, was set on fire. Newspaper hawkers were beaten up and newspapers reporting the misdeeds of the Congress(I), whether local or national, were seized and set alight before they could reach readers. A dusk-to-dawn curfew was imposed in Agartala but this did not seem to deter the Congress(I) anti-socials as the police, paramilitary forces and the administration took no action against them. Even as Agartala faced three successive days of curfew, violence spread to two other towns—Bishalgarh and Udaipur. Curfew was imposed in Bishalgarh after a market was reduced to ashes. Two persons lost their lives in clashes involving the CPI(M) and the Congress(I) when the latter forcibly tried to close shops in Udaipur so that curfew had to be imposed there. About 50 houses in Pitra and the neighbouring villages of Maharani and Laxmibil were also ransacked by miscreants, forcing the district magistrate to impose a 15-hour curfew in the entire sub-division. The body of the CPI(M) leader from Kailashahar in North Tripura district, Sudhir Shukla Baidya, who had been kidnapped by Congress(I) workers on May 21, was recovered on May 24. Underground militants of the All Tripura Tribal Force (ATTF) gunned down two TUJS workers in Khowai sub-division. Two people, said to be supporters

of the CPI(M), were hacked to death at Sachindranagar colony in West Tripura district. In Pitra village two Congress(I) workers, one of them the brother of the Congress(I) minister, Jawahar Saha, were murdered, allegedly by CPI(M) men. While the Congress(I) condemned the killings, the CPI(M) demanded the setting up of an enquiry commission headed by a sitting high court judge to go into the incidents in the State since May 21.

Meanwhile, according to official sources, a gang of 10 tribals, allegedly backed by the TUJS, gunned down three CPI(M) supporters and injured another in Santosh Jamadarpara in Sadr sub-division. A hundred houses were set on fire in Takshapara and Sibunagar village in the Sonamura sub-division. A bomb exploded in the house of the veteran communist leader Biren Dutta who was also a senior minister in the Left Front cabinet. Another victim of the Congress(I)'s violence was Birchandra Deb Barma, a veteran CPI leader, who lost a part of his property when the CPI office, which is situated on his land, was set ablaze by Congress(I) workers. The houses of the chairman of the Tripura Public Service Commission and of an eminent lawyer of the city also came under attack by Congress(I) miscreants.

The opposition Left Front and the Janata Dal demanded the postponement of the June 12 election to the two Lok Sabha seats in view of the unsettled conditions prevailing in Tripura. In a statement the CPI(M) leader, Nriper Chakrabarty, accused the chief secretary and the chief electoral officer of the State, S S Sharma, of being partisan in his approach and condemned his inability to protect the life and property of ordinary citizens. A parliamentary delegation led by Dipen Ghosh, the deputy leader of the CPI(M) in the Rajya Sabha, visited some of the worst affected areas in West Tripura district and, on its return to New Delhi, called on president R Venkataraman and apprised him of the situation in Tripura. They also met the deputy election commissioner and handed over a memorandum to him, demanding postponement of the polls in Tripura.

The political adversaries of the Congress(I) were not the only ones complaining about the Congress(I)'s violence in the State. Even a former Congress minister, Tarit Mohan Dasgupta, is reported to have said that the violence would prove "dangerous to our image, whatever is left of it". Some saner elements in the Congress(I) reportedly gave shelter to CPI(M) workers when their lives were under threat and formed joint resistance committees in different localities to check the depredations of the Congress(I) miscreants.

Unfortunately, the chief minister of Tripura Sudhir Ranjan Majumdar thought differently and, at a press conference, is reported to have asserted that the law and order situation in Tripura was better than it was anywhere else in the country. He also described the ATTF as a creation of the CPI(M) and ridiculed the demand for the postponement of polls in the State.

Meanwhile there was no let up in the Congress(I)'s reign of terror in Tripura. Everyday, reports came in about houses set on fire, people rendered homeless and CPI(M) offices set ablaze from Agartala and all over the State. There was a huge 'dharna' in front of the election commission's office in New Delhi demanding the postponement of the Lok Sabha polls in Tripura. A CPI(M) delegation led by Sukomol Sen called on the chief election commissioner (CEC) and alleged that the administration in Tripura was partial to the ruling party and informed the CEC that the law and order situation was not conducive to the holding of free and fair elections in the State. The CEC responded by sending two poll panel observers to Tripura who met representatives of different political parties in Tripura as well as the district magistrates and the superintendent of police of the State to assess the situation. They submitted their report to the election commissioner on their return to Delhi.

Meanwhile, the Congress(I) alleged that two CPI(M) activists were injured while making bombs and blamed the CPI(M) and ATTF for murdering a TJS worker. A five-member National Front delegation which visited Tripura stated that it was "more than convinced that holding of free and fair election in Tripura on June 12" was "absolutely impossible in the present situation" and blamed the chief secretary for failing to deal with the continuing violence in the State. The Union home ministry reportedly rushed Black Cat commandos to guard the Congress(I) candidate for the West Tripura parliamentary constituency, the former Union minister of State for home, Santosh Mohan Deb.

In spite of all these developments the election commission announced on June '7 that it had decided not to defer the polls in Tripura. In view of the election commission's recalcitrant attitude, in an unprecedented move in Tripura's electoral history, the CPI(M)-led Left Front decided to boycott the June 12 elections to the two Lok Sabha seats in the State and withdrew its two candidates, Manik Sarkar and Bajubon Riang. The BJP, the Janata Dal and the IPF also decided to boycott the elections and the BJP and IPF which had put up candidates, withdrew them.

Tension however continued in the State

even after the Congress(I) was practically assured of a walk-over in the elections. The Congress(I) accused the CPI(M) of killing a nephew of the chief minister and another Congress(I) activist in a bomb attack when according to the CPI(M) the two were killed in an accident while they were making bombs. According to Congress(I) sources, CPI(M) activists allegedly wiped out all four members of the household of Bijoy Krishna Deb, the chairman of the West Karamcharra Local Development Committee, a charge that the CPI(M) denied.

A farcical election was held as scheduled on June 12. Although the official voting percentage was put at 65 against 83.89 in 1989, the voter turnout was poor at almost every polling booth. Since polling was heavy but the voter turnout was hopelessly low, it is obvious that there was heavy rigging all over the State. Polling booths were taken over by Congress(I) goons. Even some known supporters of the Congress(I) were not allowed to cast their own votes, while in many other cases, supporters of the Left Front and BJP were threatened with dire consequences if they did not cast their votes in favour of the Congress(I) candidates. The polling personnel merely looked on. There are instances where they actually

connived with the Congress(I) anti-socials—cars bearing 'On Election Duty' stickers were used by the hoodlums to move from one booth to another. Two such cars carrying bombs, arms and ammunition were seized by the Assam Rifles. Though the official press release issued by the government claims that the election was free, fair and peaceful, houses belonging to CPI(M) supporters were set on fire and at least 20 people, including three security personnel, were reportedly injured on the day of polling. A polling party was attacked by the ATTF while returning with ballot boxes from Mandai after conducting the elections. The polling officer and one security guard were killed on the spot while another was injured and is undergoing treatment in a hospital. The presiding officer was abducted and is still missing. As is to be expected, this dastardly act is being projected as the handiwork of the CPI(M) by the chief minister.

The elections, for whatever they are worth, are over in Tripura but the tension has not let up. Cases of arson, looting, extortions from CPI(M) workers and threats to leave the party are continuing. Party offices and houses belonging to CPI(M) workers are being set on fire everyday in different parts of the State.

NEW DELHI

Beginning of Post-Congress Phase

BM

After the loss of the Congress(I)'s dominant position in the polity, the process of realignment of social and political forces has to become more clear-cut and refined before a relatively more effective and durable coalition of parties can win the popular mandate and form a government representative of the aspirations of the majority of the people.

THE Congress(I) has been able to manage, at least in the short run, the difficulties and problems it faced after the assassination of Rajiv Gandhi in the midst of an hectic election campaign. It has indeed managed to garner even political-electoral advantage from the tragic loss of its supreme leader. After some minor tremors, the party has also managed to settle fairly smoothly on a successor, first in the office of president of the Congress(I) and then in the office of prime minister when it emerged as the largest single party in the 10th Lok Sabha. All this has created an impression in many circles, especially in sections of the middle class and more strongly among those who still claim to have leftist leanings but

are concerned more with stability than change, that the Congress(I) has at last overcome a prolonged crisis, internal as well as in its popularity rating, and is now ready to consolidate its position for another long spell in power and in the process restore stability to the Indian state. Obviously a lot of optimism and wishful thinking colours this view of things. Even if factional troubles in the Congress are ignored, what cannot be missed is that the Congress(I) government is a minority government which is not even assured of outside support in parliament as was the case with the National Front government when it was formed after the election to the ninth Lok Sabha. Narasimha Rao's government is bound to prove a fragile

instrument in the hands of those who have a vested interest in the Congress(I) being in power. The pulls and pressures and squabbles inside the Congress over the composition of the government and the allocation of portfolios, the ongoing campaign of what has come to be termed as the 'coterie' which still asserts the supremacy of the Nehru-Gandhi family in the affairs of not only the Congress(I) but Indian polity itself must not be missed. Also important is the fact that all the other political parties are determined to keep their distance from the Congress(I) and have declared their preference to sit in the opposition, though they do not propose to pull down the Congress(I) minority government for the time being.

It is neither surprising nor fortuitous that there has been a succession of minority governments. After the loss of the Congress(I)'s dominant position in the polity, the process of realignment of social and political forces has to become more clear-cut and refined before a relatively more effective and durable coalition of parties can win the popular mandate and form a government representative of the aspirations of the majority of the people. Meanwhile, politics is bound to be in a state of flux. Political parties will have to go through turbulence and turmoil, internally as well as in their relations with other parties. This will be markedly the case with the Congress(I). Its internal cohesion is bound to be in question. Its break-up will remain very much on the agenda as part of the wider realignment of forces. Its validity as an all-class, all-purpose party no longer holds. The question is how long the minority government headed by Narasimha Rao will last before it becomes necessary to go back to people for a fresh mandate. Two to three years is the maximum tenure that shrewd observers give to the Congress(I) government. Its end may come earlier if the rival political formations consider themselves ready to enter another electoral contest. The sharpening economic crisis and the likely manner in which it may be attempted to be tackled under the Congress(I) dispensation may well precipitate matters on the political front.

A striking feature of the political environment after the long phase of single party domination has been broken is that the conflicts of interests in society are coming into the open at a fast pace. The realignment of political forces in these conditions has tended to be influenced thus far by the tussle, above all, between big business interests with their hangers on among middle class professionals and the intelligentsia on the one side and rich farmers and their champions on the other. These two contending parties have, side

by side, striven to establish a new political equilibrium which will safeguard their vital interests against the growing challenge from social forces which do not fit into their scheme of things. It will be interesting to watch the policy adjustments and administrative arrangements as well as political and personal wheeling and dealing that would be part of this process. In these conditions there will necessarily be much confusion and lack of coherence in policy-making and in political and administrative action.

The position of a minority government will, therefore, remain vulnerable. It will not be possible to hold back for long the democratic imperative of firming up the popular mandate. Those who appeal to the narrow vested interest of those who have been elected to the Lok Sabha to mobilise support for any party or group in a power-sharing arrangement would be regarded by the people as being engaged in political fraud.

The line of political demarcation that stands out at present is between those who stand in favour of intervention by the public authorities for the economic and social upliftment of the mass of the poor people and those who would rely on the free play of market forces to establish what is called a link between economic activity and its rewards so as to maximise the returns to the holders of property and assets. The entrenched forces of *status quo* cannot be expected to give up their dominant position and privileges without a fierce and prolonged struggle. The IMF loan under its structural adjustment facility, on which so much attention is being focused as the panacea for the acute balance of payments problem, will open the way to neo-colonial dependency. For self-reliant economic growth with equity, it will be necessary to rely primarily on the mobilisation and optimal utilisation of domestic resources, human and material. The need is for basic reforms in the socio-economic structure. The carrying out of these reforms is not amenable to the philosophy of gradualism and legalistic measures. They cannot be brought any nearer completion by investment plans which have been or may be launched. This is what makes the hang-ups with the financial size of a high growth plan and large loans to plug the balance of payments as well as budget deficit irrelevant in terms of the living condition of the mass of the people. The mobilisation of domestic and foreign savings for investment to promote growth in response to effective demand in the market cannot but come into conflict with the order of economic and social priorities which subserve the needs of the majority

of the people. The durability of the minority Congress(I) government will be tested on the basis of the sides it takes on this and other crucial socio-economic issues.

The process of realignment of social and political forces in India has been undergoing significant changes since the mid-sixties. The 1989 general election ushered in the era of coalition politics. A coalition government, however, cannot be an arrangement solely or even mainly for the sharing of political and administrative power and pelf by its constituents. After the initial euphoria, there can be no escaping the policy and ideological differences among the coalition partners. This calls for constant and skilful delineation and refinement of the minimum agreed basis for the effective working of the coalition. The issues under contention need to be seriously, widely and publicly debated in order to evolve and implement sound policies. The National Front coalition government during its brief tenure was an instructive experiment in coalition politics. For a coalition government to be viable and give the desired results, a series of compromises among the coalition partners have to be negotiated, though not compromises designed essentially to pander to vested interests.

The outcome of the 10th Lok Sabha election is bound to be fateful in the prevailing conditions. The country is undoubtedly passing through difficult and dangerous times. It is, however, noteworthy that the assassination of Rajiv Gandhi should have been seized with alacrity as an opportunity to project the idea of a 'national government'. The notion of a national government, if given any credence, let alone implemented, can only be the starting point on the road to the subversion of the democratic content of the Indian Constitution and liquidation of party-based parliamentary democracy. The concept of an enlarged Congress too deserves some critical attention. This is intended to project the return of 'former Congressmen', most prominently Chandra Shekhar, who came to occupy the office of the prime minister with the support of the Congress(I) under Rajiv Gandhi's leadership. Chandra Shekhar made feverish efforts, once he managed to acquire a position of political advantage, to claim that he alone could be the saviour of the nation facing chaos. The claim has been rendered ridiculous after his miserable showing in the Lok Sabha elections. The slogan of the national government with which is closely linked the idea of an enlarged Congress carries within it many dangerous implications and must not be allowed to gain strength.

Dravidian Politics: End of an Era

V Geetha

S V Rajadurai

Its many political compromises notwithstanding, the DMK had served as the focus in Tamil public life for a range of subaltern interests to come together and articulate their concerns and anxieties. Even those who had all along been critical of the DMK, therefore, feel dejected by the bitter end to an era of Dravidian politics.

THE complete rout of the DMK in the recently concluded elections has saddened and upset even those who have no love lost for that party. Non-Brahmin professionals, intellectuals and writers have been stunned into anguish by the electoral results. It is not so much a case of being disheartened by the DMK's defeat but being greatly shaken by what is widely and popularly experienced and seen as a mortal blow to the intertwined causes of Tamil nationalism and social justice.

It is true and tragically so that the DMK has, for some time now, reneged on its commitment to its founding ideals, especially to the cause of self-determination of Tamils. Its guarded approach to the Eelam question, its painstaking efforts to distance itself from the 'terrorist' aspects of the struggles in Sri Lanka have betrayed a will to compromise and survive. It is also true that in spite of its much-publicised (in the Brahmin press) anti-Brahminism articulated at the 1989 State conference of the DMK in Trichi, the party's struggles against Brahminism have been more symbolic than real.

These compromises notwithstanding, the DMK had served as a focus in Tamil public life for a range of subaltern interests to come together and articulate their concerns and anxieties. The DMK had represented the assertive political will of the non-Brahmin communities and its historical role had been much appreciated and vindicated in the context of the anti-Mandal hysteria that ensued last year. The DMK's fall, then, in spite of the indomitable challenge it posed to upper caste belligerence, must be attributed, at least partially, to its misogynistic political rhetoric. The violence against Jayalalitha on the assembly premises and the subsequent propaganda that was unleashed with much anti-woman malignancy succeeded in alienating the woman voter more or less completely. However, it is important that we do not lose sight of Jayalalitha's own undemocratic and authoritarian behaviour at her only appearance during the assembly proceedings. Nor can we afford to lose sight of the fact that Jayalalitha never tired of referring to the 'violation' she had suffered on the assembly floors, often invoking

images of injured womanhood in exaggerated and melodramatic detail. It is another matter that her 'rightful anger' came across as incongruously insincere, since her invocation of male violence hardly ever considered the innumerable instances of violence against women in rural areas, middle class homes and police stations. Besides, her 'hero' and 'defender' MGR (the songs in his films, noted Jayalalitha, ought to be our lessons) had consistently espoused a feminine ideal subordinate in every respect to men and the patriarchal family. But, if, in spite of these ideological inconsistencies, Jayalalitha succeeded in capturing the imagination of the Tamil masses, the reasons must be sought elsewhere.

In this context, then, the DMK's defeat indicates the following:

(a) The limits to an oppositional counter-culture (that sought to challenge Brahmin hegemony) which consistently glamorised its politics. Such a glamorisation has now led to the near collapse of politics and the triumph of cinema and spectacle. (C N Annadurai and M Karunanidhi had been instrumental in cultivating actively the 'myth' of MGR). The DMK, especially Karunanidhi, had, moreover never chosen to fight MGR politically. Worse still, during these recent election campaigns Karunanidhi had sought to project himself as a 'true' friend of MGR and allied himself with the breakaway faction of the AIADMK. The irony of the whole exercise became apparent when two of the nine candidates belonging to this group won the elections while all of the 171 candidates fielded by the DMK lost, save for its leader. It is also significant that the lone successful Pattali Makkal Katchi (PMK) candidate (Panruti Ramachandran) and the only successful independent candidate who won (Tamaraiyani) were once AIADMK notables.)

(b) The persistence of Brahmin hegemony mediated through an arrogant, unrepentant and avowedly casteist Brahmin intelligentsia that makes its views and opinions known through the strategic use and abuse of the media.

(c) The hollowness of the 'ethnic pride' and 'Tamil nationalism' as articulated by

the DMK relying as it did on sneer rhetoric and the power of language to advance its claims in this respect.

(d) The determination of the Indian state to decimate Tamil nationalist aspirations, even when these are articulated within the limits marked by the Constitution and its concerted efforts to brand Tamil nationalist politics as criminal.

These and other related reasons that have brought about the DMK's defeat assume immense significance in the aftermath of the assassination of Rajiv Gandhi. Even prior to the assassination the Congress-AIADMK campaign had overtly and covertly sought to portray the DMK as a potential secessionist force in league with the LTTE. The campaign was but the grand finale to a systematic year-long attempt by the Congress-AIADMK combine and later on the Indian state with Chandra Shekhar at the helm to discredit the DMK government: not on matters of economic and social policies or even of political choices but over an ideology of Tamil nationalism that had, long since, become moribund as far as DMK political praxis was concerned. The DMK had never really been comfortable with the LTTE's militant nationalism and it is ironic that its electoral defeat was due to a cause it espoused more by compromises over it than its commitment to it.

The assassination of Rajiv Gandhi crushed the Congress-AIADMK's arguments against the DMK and confirmed the Indian state in its determination to challenge and destroy Tamil nationalism. The DMK could not even campaign in the weeks following the assassination, so successful were the Indian state's efforts to discredit it. The media played an inglorious role here, as may be expected, given its patent anti-Dravidian thrust.

What is, perhaps, most painful as far as the non-Brahmin sections of the population are concerned, is that the defeat of the DMK has provided an impetus to a kind of aggressive Brahminism. Tamil Nadu has not witnessed in decades (one has only to glance through the 'Letters to the Editor' section in *The Hindu* to get an idea of the blatant casteism, routinely and nonchalantly exhibited by the Brahmins). The Congress-AIADMK combine have contributed in no small measure to this phenomenon. The combine has consistently debunked Tamil nationalist ideals as secessionist and Brahminism, allied as it is to a pan Indian nationalism, has been quick to take umbrage at 'those secessionist' claims. Besides, the Jayalalitha factor has neutralised whatever Dravidian politics the AIADMK had attempted to retain. It is significant that Jayalalitha consciously appealed to Brahmin sentiments. Not only did she nominate several Brahmins as her party's candidates in Madras city and

elsewhere, but she sought and obtained the blessings of the Kanchi Shankaracharya before launching her campaign. This, on the one hand. On the other hand, she constantly invoked the name of E V Ramasamy Periyar and thereby claimed the heritage of the Dravidian movement. It is tempting to recall here what Kuthoosi Gurusamy, a prominent Dravida Kazhagam leader of yesteryears once remarked about Brahminism: that even if there were to be an independent sovereign Dravidian state, with Periyar as its president, the first people to welcome him would be the Brahmins! Gurusamy was particularly sensitive to the co-opting dynamic that seems to have been a salient aspect of Brahminism since the days of the Buddha, and the recent events in Tamil Nadu have proved him right.

The triumph of the Congress-AIADMK combine has also to be viewed in the con-

text of the BJP's all-out efforts to woo the Tamil masses. Given the BJP's relentless and systematic mode of functioning, it is not hard to imagine it providing a well structured space for Brahmin and more generally upper caste resurgence in the days to come. Even during these elections the BJP campaigned actively in some constituencies where Jayalalitha had fielded her candidates, thereby tacitly following up on the Kanchi Shankaracharya's appeal to the electorate to vote either for the BJP or the Congress-AIADMK combine.

Thus, on the one hand, the Tamil masses have to reckon with the might of the Indian state ready to crush it into homogeneity. On the other hand, they have to face up to the challenges of a refurbished Brahmin hegemony that would consciously strive to turn this homogeneity to its own account.

All these distinctions notwithstanding, the CPI(M) and the Left Front have really fallen behind the BJP in terms of relative performance. Indeed, from a different perspective it may be said that the Left is really indebted to the BJP, as quite a number of seats in the Lok Sabha as well as the State assembly have accrued to them only because the BJP has split the opposition votes.

Although, as mentioned before, the BJP has not been able to secure a single seat from this State, it has increased its share of aggregate votes in West Bengal from 5.3 lakh in 1989 to 35 lakh this time or from 1.7 per cent of the total to about 12 per cent. Since the size of the participating electorate has increased, the rise of the number of votes received by each candidate on average may not bring out the real dimension of the BJP's advance which is better revealed by the figures of the comparable depth of support in terms of average percentage of votes per candidate.

In 1989, the BJP polled an aggregate of 1.7 per cent of the total votes cast by fielding only 19 candidates. In other words, it secured 0.089 per cent of votes per candidate. This time it has got 12 per cent of votes by setting up 42 candidates or 0.285 per cent per candidate. In other words, it has increased the depth of support by about 320 per cent. On the other side, the aggregate shares of total votes of the Left Front and the CPI(M) declined from about 51 per cent and 38 per cent in 1989 to about 46 per cent and 35 per cent respectively, with the number of candidates remaining largely the same.

The BJP polled over a lakh votes in 15 Lok Sabha constituencies, thus radically changing the bipolar character of West Bengal politics. Electorally of course the CPI(M) and Left Front can only gain from this development; it makes them practically unbeatable in this State, as a complete or near complete coalescence of the Congress and BJP votes in the foreseeable future is practically impossible. Hence, this division of opposition votes makes the Left's electoral position very secure.

But in terms of more fundamental political interests, the BJP's rise as a mass force is a very serious danger signal to the Left and progressive forces, not only because its banner of militant Hindutva is a grave threat to communal harmony and peace, but also, and more importantly, as many discerning newspaper reporters have noted in their analysis of the West Bengal electoral scene, the BJP in the countryside has been able to establish linkages with rural social forces who have been adversely affected by the Left Front's not so radical agrarian reforms. It has, thus, become the focus of combined social and political reaction.

WEST BENGAL

BJP's Rise as a Mass Force

Ajit Roy

In electoral terms the rise of the BJP has helped the Left Front by splitting the Congress vote, but in terms of more fundamental political interests it is a serious danger signal to Left and progressive forces.

THE fact that the West Bengal polls, held before the Sriperumbudur tragedy, were free from any impact of the so-called sympathy wave enabled the electorate to give an undistorted picture of the political layout of the State. A turnout of 70 per cent of the voters in what was by any standards a free and fair poll also contributed to bringing out a truthful reflection of the political preference of the State's people. After taking everything into consideration, the West Bengal Left Front's, and its leader the CPI(M)'s, performance in these rounds of elections has been quite impressive. As for the Front, it has retained the same number of seats in the Lok Sabha as in the previous house, that is, 37 out of 42. In the State assembly, it has once again secured a three-fourths majority with 244 seats out of 294, although compared with the previous house it has lost half a dozen seats. The CPI(M)'s tally also follows the same pattern. With 27 Lok Sabha seats, the position remains unchanged and with 182 assembly seats—five less than its tally in 1987—the party as before enjoys nearly a two-thirds majority of its own.

The Congress has increased its strength marginally from 40 to 43 in the assembly and by one in the Lok Sabha from four to five (only by lending its symbol to the GNLFC candidate from Darjeeling—the same old imported nominee, Inderjit, the journalist from Delhi).

The BJP which contested every Lok

Sabha and assembly seat failed to bag any. The Muslim League has lost the lone seat it had in the last assembly. Indeed, indications would suggest that the Left Front may have regained the allegiance of the small section of the Muslims that it appeared to have lost in the last assembly elections: it has wrested the Entally and Kavitiritha constituencies in Calcutta which it had lost in 1987. These areas have large Muslim concentrations. With the gains in these two, the Front has also improved its position in Calcutta city proper.

Most importantly, the CPI(M) and the Left Front have regained their supremacy in regions with a preponderance of industrial workers. This they had lost in the 1984 Lok Sabha elections and failed to regain appreciably in the 1987 assembly and 1989 Lok Sabha polls. They have now fully recovered their supremacy in the industrial belts in the districts of Bardhaman, Howrah, Hooghly and North 24 Parganas.

Among the major Left Front parties, Forward Bloc has improved its strength in the assembly from 27 to 29, the RSP's position remains unchanged at 18, and both the CPI(M) and the CPI have lost five seats each. In the CPI's case it means a reduction from 11 to six, almost by one-half.

All ministers except four have returned to the house. Of the losing four, two belonged to the CPI(M) and one each to the CPI and FB.

Education: Muddying Troubled Waters

Philip G Altbach

President Bush and his education secretary have presented a number of ideas which are, for the most part, not bad. But these proposals have no chance of success because of the current economic climate and the unwillingness of the Federal and State governments to devote necessary resources.

GEORGE BUSH aspires to be the 'education president'. So far, he gets an 'F'. His newly unveiled plan is a non-starter. Worse, it diverts attention from current initiatives and current problems. The president and his newly appointed education secretary, Lamar Alexander, have presented a number of ideas which are, for the most part, not bad. They are also not new. And they do not get to the heart of the problem. In many ways, it is worse to have the new Bush plan than to keep on the track of educational reform that was proposed and partially implemented a half-decade ago during the last round of concern with education.

The educational reform movement of the 1980s, developed largely at the State level and funded entirely by the States, not only contained some good ideas but also attracted considerable support in State legislatures and from the education community. Among the reforms were tightening up educational requirements and standards, improving teacher salaries in order to attract more talented people to teaching and at the same time providing more professional autonomy and initiative to teachers and improving (but not abolishing) teacher education. The stress was on 'excellence in education' and the problems of the educationally unprivileged were virtually ignored. In New York, the Regents Action Plan was developed and partially funded. Lamar Alexander, when he was governor of Tennessee, implemented (and lavishly funded) an impressive set of reforms.

It is important to note that the federal government played virtually no role in the 1980s reforms. The Reagan administration continued to cut federal funding to education as well as to other public services and more and more responsibility devolved on the States. Federal tax cuts had a double impact at the State level—not only forcing the States to assume responsibilities previously funded from Washington but creating an atmosphere of tax reduction. The States, unlike the federal government, cannot run large deficits. They must either raise revenues or cut services. Then, at the

end of the decade of the 1980s, the American economy slowed down and recession took hold. The States are now faced with an extraordinary fiscal dilemma—budget and service cuts are being put into place throughout the nation. It is entirely unrealistic to expect that positive educational change can take place in the current climate of fiscal disaster in the States.

New York State is a good example. The Regents Action Plan called for increased salaries for teachers, a longer school year, enhancement in the curriculum and other reforms. In the first flush of enthusiasm, Governor Cuomo provided additional funds to implement a few changes although one of the most important proposals—lengthening the school year to provide more instructional time for students (it should be noted that Americans have the shortest school year of any industrialised country)—was quickly dropped because it was too expensive. Anticipating the implementation of the reforms, the Regents mandated an enhanced foreign language requirement to graduate from high school with a 'Regents Diploma'.

What has happened is that few of the reforms have been sustained because of continuing fiscal cuts. We have even seen a decline in the number of students earning the Regents Diploma, largely because foreign language instruction was not improved in most schools. Current drastic budget cuts are eliminating entire areas of the secondary school curriculum—and foreign languages are among the first to go. Teachers, promised improved conditions and more autonomy, are now threatened with layoffs and are seeing class sizes enlarged. It is no wonder that morale is at rock bottom.

For the most part, we are aware of the problems of American education. And we know how to fix many of them. Indeed, Chester Finn, Jr, a key Reagan Bush education advisor and a former official of the US department of education, wrote a slim book entitled *What Works* a few years ago. We know that the most serious

problem for American education is the failure to adequately educate the underclass—largely but not exclusively minority African Americans and Hispanics have the highest drop-out rates and it is not surprising that their unemployment rates are correspondingly high. The 'excellence' movement of the 1980s ignored this issue and the current Bush initiatives totally fail to deal with it. We know that a variety of programmes work—'Headstart' early childhood intervention efforts have been immensely successful. 'Magnet schools' that provide alternative educational programmes have promoted racial and ethnic integration and have also been academically successful. We know that more time devoted to instruction yields improved results.

We also know that school improvement requires funding. It is especially true that intervention programmes such as Headstart and special enrichment programmes both for those 'at risk' of dropping out and for the 'gifted and talented' require resources. These two groups are of extraordinary importance for American education. US schools do a decent job (although not outstanding) of educating the 'great middle', but fail at both the lower and upper ends. At present, we have the worst of all possible worlds—cutbacks in existing programmes and the inability to implement any positive changes.

What of the specific Bush proposals? Several are highly controversial. A major stress is on 'choice' in education. On the surface this sounds like a good idea. Why should not parents have choices concerning where they send their children to school? But choice is to include private schools which will very likely have the result of further segregating American education—both by race and social class. National testing of students is also called for. Also controversial, this proposal would at least permit States and localities to see how their students are doing in comparison to others.

The fact is that American education is going nowhere. Current budget cuts have already destroyed the progress that was laboriously made after the last wave of reforms. Bush's proposals have no chance of success because of the current economic climate and the unwillingness of both the Federal government and the States to devote the needed resources to education. In some respects, the Bush proposals muddy the already troubled waters of American education.

Auditors' Report

We have audited the Balance Sheet of the Bombay Branch of The Mitsui Taiyo Kobe Bank Limited as at 31st March 1991 signed by us under reference to this report and the relative Profit and Loss Account of the Bombay Branch of the Bank for the year ended on that date with the books of account maintained and produced to us at Bombay.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949 read with the provisions of sub sections (1), (2) and (3) of Section 211 and sub section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and Profit and Loss Account together with the notes thereon are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act, 1956. The accounts are therefore drawn up in conformity with Form A and B of the Third Schedule to the Banking Regulation Act, 1949.

We report that -

(a) we have obtained all the information and explanations which to the best of our knowledge and belief were necessary, for the purpose of our audit and found them to be satisfactory,

(b) the transactions which have come to our notice have been, in our opinion, within the powers of the Bombay Branch of the Bank,

(c) in our opinion, proper books of account as required by law have been kept by the Bombay Branch so far as it appears from our examination of those books.

(d) the abovementioned Balance Sheet and Profit and Loss Account of the Bombay Branch of the Bank dealt with by this report are in agreement with the books of account.

(e) in our opinion and to the best of our information and according to the explanations given to us, the accounts together with the notes thereon, give the information required by the Companies Act, 1956, in the manner so required for Banking Companies, and on such basis the said Balance Sheet gives a true and fair view of the state of affairs of the Bombay Branch of the Bank as at March 31, 1991 and the Profit and Loss Account gives a true and fair view of the Profit of the Bombay Branch for the year ended on that date.

Rethinking Political Options

Gurpreet Mahajan
Sarah Joseph

The issue of forging areas of agreement is a pressing one in our fragmented society. But any new consensus would have to consider the demands of groups and interests which are being marginalised by the process of development. A centrist ideological consensus along the Nehruvian lines is not an option available to us any longer. Nor can it offer a possible solution to the problems facing the country.

GIVEN the prominent role which the Congress Party has played in Indian politics, as well as the special charisma attached to the Nehru/Gandhi family, the death of a Congress leader belonging to that family has always raised complex fears and hopes in the minds of people in India. Fears regarding the possible break up of the Congress Party, about the possible disintegration of the country, the possibility of economic collapse and political disorder were voiced when Nehru died as much as when Indira Gandhi and Rajiv Gandhi died. Nehru's death was seen as a cataclysmic event for the country by both Indian and foreign commentators.¹ Indira Gandhi's death also aroused fears about the future of the country and similar fears are being expressed today. The death of major leaders has also, however, raised hopes that the shock would force the Congress to put its house in order, restore a more democratic style of functioning, rebuild a national consensus around progressive policies and programmes and guide the country out of its problems.

Neither the hopes nor the fears have been fully realised in the past but the present crisis in the party has certain special features. For one, it is unlikely that the family will be able to produce another successor in the near future, so the Congress Party will have to look outside for a leader and the war of succession is already on. Further, the decay of the Congress Party institutions as also of the political system in general, has progressed considerably in recent years making the possibility of reform and renewal that much more difficult. All this has made the future appear threateningly uncertain and in such a situation the past acquires greater attraction. Hence we find a number of people looking back nostalgically to the Nehru era which symbolised, in their view, a more democratic style of functioning and consensus around certain values such as socialism, secularism and democracy. It is significant that Narasimha Rao in his first statement on taking office as Congress president promised to adhere to the Nehru line.

Implicit in the attraction for the Nehru model is the belief that the Congress, more

than any other party, is capable of leading the country out of its problems, that it alone can once more fashion a centrist, ideological consensus around which diverse groups and interests can be brought together to work for the country. The only requirement being that it return to its earlier accommodative style of functioning. According to this version, the Indira Gandhi era destroyed the consensual character of the Congress. The Congress became a party in which power was personalised and centralised around a leader, advised by a select coterie of associates and friends. The ideological consensus of the earlier period was shattered and policies projected in the name of the prime minister. Rajiv Gandhi continued this trend.² It is now hoped that if these developments can somehow be reversed the Congress would still offer the best hope for the future. Such hopes have been expressed by sections of the intelligentsia and press as also by some Left politicians and ex Congressmen and they probably reflect the feelings of a wider group among the middle classes at least.

Given this kind of nostalgia for the Nehru model it needs to be critically examined. A number of questions can be raised in this regard. What kind of ideological consensus existed during those years? To what extent was the style of functioning of the Congress Party and the government genuinely democratic and consensual? Did the changes introduced by Indira Gandhi in the party and the government signify the emergence of an entirely new kind of politics or were the seeds of some of these developments sown in the Nehru era itself? And, most important of all, is it possible or even desirable to try and recreate a centrist consensus of the Nehruvian kind around a restructured Congress Party today?

We should remind ourselves that the post independence Congress inherited the prestige and legitimacy associated with the national movement. Its leaders had also guided the struggle against the British and its goals and programmes were, to a considerable extent, a rearticulation of the programmes projected during the freedom struggle. The Congress was a symbol of the shared aspirations of

the people of India and as such, it started with a wide consensus of opinion in its favour. One should not oversimplify here. Of course there was, and always had been, opposition to the Congress especially from the extreme Right and Left. There was also always dissident opinion within the Congress. But for all that it had a certain legitimacy. Any attempt to build a consensus around the Congress today would have to contend with the serious erosion of its legitimacy and a loss of hope, even cynicism, about building a better future under its guidance. The inability of the system to deliver, erosion of the standard of living of even the relatively affluent, growing disparities of wealth, corruption, all these have undermined the attraction of the Nehruvian path of development, though not of the notion of a centrist ideological consensus under the guidance of a more democratically organised Congress Party.

NEHRUVIAN EDIFICE

The pillars of the Nehruvian edifice were industrialisation, secularism, socialism and non-alignment. He believed that a strong, independent and united India required extensive industrialisation under the guidance of the state. Apart from promoting greater productivity and a faster rate of growth, state intervention could also ensure more equitable distribution. Nehru also believed that industrialisation would break down primordial and regional loyalties and provide a new ethos and world view for the tradition-bound people of India.³ His was a truly modernist vision and this set him apart from many of his colleagues in the party and government.

It needs to be emphasised here that the programmes articulated by Nehru were acceptable in their entirety mainly to the urban elites. With other sections of the population support was more selective. Policies like secularism or land reform or planning evoked as much opposition as they did support. In fact, the ideological consensus which in retrospect seems to be the single most significant achievement of Nehru's leadership was quite fragile and it was constantly being negotiated. While Nehru himself was committed to the entire set of goals, he had continuously to work within the party and the government to explain and defend the goals and build up support for them. To carry different groups and interests with him he often had to make compromises and accept dilution of policies which he held dear to his heart. Paradoxically enough, the inner party democracy, which is hankered after today, contributed to the difficulty of consensus formation. By manipulating the membership rolls different factions could gain control over Pradesh Congress Committees and it

has been pointed out that by 1949 conservative coalitions around dominant landowning castes in alliance with businessmen had captured control over most Pradesh and District Congress Committees.⁴ Represented in the cabinet by Sardar Patel they could exercise significant influence over policies and their implementation, as was evident in the case of land reforms and changes in the Industrial Policy Resolutions. Consequently, a series of measures were introduced to encourage private investment in the early years and specific reassurances against nationalisation were inserted into the First Five-Year Plan. Such compromises were a continuing feature of Nehru's prime ministership. This was the reverse side of the accommodative politics for which the Congress has been praised. It led to a vicious circle of compromises at the level of policy formation and implementation and resulted in the poor performance of government, and this in turn undermined the authority of the leaders and their power to push through future policies.

One sign of the growing disenchantment was the frequent splintering of the Congress Party. The Socialists on the Left and the Hindu Mahasabha elements on the Right left soon after independence and the process continued. For instance, in reaction against the goal of a socialistic pattern of society accepted at the Avadi session of the Congress in 1959, some ex-Congressmen joined with business interests to form the Swatantra Party. True, the Congress still retained within its fold representatives of many ideologies and interests and within the limits of possibility still tried to accommodate them. The boundaries of the party were fluid enough to accommodate two-way traffic for individuals and groups. This was the famous 'Congress system' extolled by political scientists at the time as a model of consensual politics, a recognition at the institutional level of the diversity of Indian society. But there was a price to be paid for such politics and over time it led to an erosion of support for the Congress which was translated into votes during the elections.

The accommodative style of functioning was not the only instrument for achieving consensus during the Nehru era. Parliamentary democracy was considered to be another acceptable way of negotiating differences. Nehru deeply believed in parliamentary democracy and tirelessly tried to instruct and guide politicians in the niceties of democratic procedures and conventions. In sharp contrast to his successors, he regularly attended parliament sessions and participated in the proceedings. Although the Opposition was insignificant in size he ensured its rights of expression and, in the early years at least, even associated non-Congress members with governance. Within the party, State chief ministers were, on the whole, chosen on the basis of the support they could command at the State level and they were given considerable freedom of

manoeuvre. Party finances were collected at the State level and then shared out, and accounts kept of receipts and expenditures. Candidates for elections were chosen at the State and district levels. All this is fairly well known. What is not equally emphasised is that while upholding democratic norms and constitutional properties he sometimes reserved to himself the right to set them aside. A case in point was his handling of instances of corruption in high places. Upendra Baxi has referred to his reluctance to invoke existing anti-corruption laws or to establish any generalised instruments for vindicating guilt.⁵ Except in the Mundhra LIC case and the Kairon case he never welcomed formal commissions of inquiry, and in the Serajuddin case he declared that S R Das, a sitting judge of the Supreme Court, would conduct a 'private and unobtrusive' enquiry that would neither be published nor tabled in parliament. The recommendations of the judge would only be there to guide him. This was just one of the many cases in which he bypassed legal procedures and combined in his person the functions of executive and arbitrator. Acting as a moral guide and conscience keeper he became the custodian of public morality and rose above criticism and censure. This added to his charisma and insofar as charismatic authority is grounded in the power of personality rather than rules it undermined rational-legal authority.

The contradiction between charismatic authority and belief in constitutional procedures was always present in Nehru's leadership style. It became more pronounced towards the end. If it did not cause much consternation, it was primarily because people never doubted his personal integrity. While there were charges of corruption and nepotism against senior colleagues they did not rub off on to him. This same respect however has not been conceded to his successors.

Thus, concentration of power in the office of prime minister and reliance on charismatic appeal were processes that began in the Nehru era itself. After his death many references were made to his dictatorial ways even by members of his own party. A cartoon in *Swarjya* in 1964 captured this feeling. It showed democracy as a woman blinded by the glare of Nehru's personality but recovering after Shastri came to power. There is no doubt however that the scale and manner in which legality was undermined and institutions bypassed during Indira Gandhi's term in office was quite unprecedented. In the government power was concentrated in the prime minister's office. In the party, finances were centralised as was the choice of candidates for elections. In the post-Sanjay era, State chief ministers were hand-picked at the Centre often from those without any local base, and replaced arbitrarily. *Ad hoc* committees replaced State and District Congress Committees and factionalism was encouraged as a means of pro-

moting the power of the leader. Through skilled advertising techniques the plebiscitary character of elections was underlined and constitutional proprieties and procedures were cynically flouted, a process which culminated in the Emergency.

Although the contrasts with the Nehru era are evident we should be careful about drawing the lines too sharply. As we have argued, the tendency towards personalisation of authority and authoritarianism was already present, particularly towards the later years of Nehru's life. Indeed, to some extent, these were the inevitable response of a party which was trying to achieve radical social goals through accommodative modes of functioning. The choices pointed towards either a more radical revolutionary style of mobilisation of which the Congress was not capable of further centralisation of power and building up of support through populist measures. Indira Gandhi saw the logic of the situation and acted with considerable finesse to build up her power base. Rajiv Gandhi with his computers, merely provided a modern, technological footnote to the process.

The malaise of the Congress, as of the country, cannot be reduced to a matter of leadership styles. Therefore we cannot hope that another individual, however talented or high principled, could cure it in the absence of wider social changes. Nor can we expect dramatic results from what has been termed inner party democracy. There is no doubt of course that the Congress needs to revitalise itself and become more democratic in its functioning. But this is also a need of all parties. Moreover, it is doubtful whether parties alone can become truly democratic within the present political set-up.

While considering political options we must also recognise that there were inbuilt contradictions in the Nehruvian model of development. For one, it combined the notion of democratic participation in the process of development with the belief that major initiatives for economic and social change should come from above, from the state. The latter increased the power of the state and resulted in the emergence of an unwieldy bureaucracy. The dilemmas of a top-down approach to socialism were recognised by leaders like Kamaraj who had argued that if the Congress wanted to achieve socialism it should have as its base the deprived and they should also occupy organisational positions. Despite these suggestions the State-centred approach was never really challenged.

The Nehru model also relied on extensive industrialisation both to generate faster economic growth as well as to help transform society. The experience of the last few decades has drawn attention to the high ecological and social costs of uncontrolled industrialisation. It has also shown us that far from eliminating caste and regional loyalties, development is likely to reinforce them. These consequences of modernisation make this vision less attractive today.

It has of late been argued that economic liberalisation could provide an alternative path towards economic growth without increasing the power of the state. The market could also possibly provide a new basis for integrating people. This view has many advocates among the urban middle classes whose appetite for a high standard of living has been stimulated by the policies of the last decade. Today, given our economic vulnerability liberalisation may be imposed on us. The compulsion of achieving a faster rate of growth through higher productivity and efficiency would necessitate restructuring of organisations and institutions, particularly in the public sector. However, liberalisation is unlikely to provide a complete answer to the dilemmas of growth and participation. It would not only further marginalise vulnerable groups but would also retain the notion of development under the guidance of an elite, albeit a technological one. Moreover, since the approach to issues would be essentially a managerial one, it would not be able to address the problem of popular demands.

The issue of forging areas of agreement is a pressing one in our fragmented society. But any new consensus would have to consider the demands of groups and interests which are being marginalised by the process of development. Having been inducted into the political process their demands would have to be recognised. This would call into question the accommodative style of functioning which was able to weave a consensus in the past. Although the notion of a centrist ideological consensus along the Nehruvian lines carries considerable appeal even today, it is not an option available to us any longer. Nor can it offer a possible solution to the problems facing the country.

Notes

1. Soon after Nehru's death, Inder Malhotra writing in *The Statesman* (26-1-1964) said: "A large number of people, many of them Congressmen, frankly feared that the Congress would break into parts, if not pieces."
2. Although at the AICC session in Bombay in 1985, Rajiv Gandhi promised to rebuild the Congress from the grassroots and rid it of power brokers, he was unable to perform the task. Initially he lacked the experience and skill to do it, subsequently even the political will.
3. Writing in *India, Today and Tomorrow* (Azad Memorial Lectures, Calcutta, 1960) Nehru said: "I want the narrow conflicts of today in the name of religion or caste, language or province to cease, and a classless and casteless society to be built up where every individual has full opportunity to grow according to his worth and ability".

TAMILNADU PETROPRODUCTS LIMITED

No. 6, Nungambakkam High Road, Madras 600 034.

NOTICE

It is hereby notified for the information of the public that TAMILNADU PETROPRODUCTS LIMITED proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval to the establishment of a new unit. Brief particulars of the proposal are as under

1. Name and Address of the applicant
TAMILNADU PETROPRODUCTS LIMITED,
6, Nungambakkam High Road,
Madras - 600 034.
2. Capital structure of the applicant organisation
Authorised Capital - 10,00,00,000 Equity Shares of Rs. 10/- each
Issued, Subscribed and Paid-up Capital - Rs. 48,75,00,000/-
3. Management structure of the applicant Organisation indicating the names of Directors including the Managing/Whole-time Directors and Manager, if any.
The Managing Director is in charge of the day-to-day management of the Company under the superintendence, control and guidance of the Board of Directors.
Board of Directors
Thiru R. Poornalingam I.A.S.—Chairman
Thiru A.C. Muthiah—Vice Chairman
Thiru K. Thirupathi—Managing Director
Thiru T.K. Kameshwaran—Finance Director
Thiru A.C. Chakraborty
Thiru J.B. Dadachanji
Thiru M. Srinam
Thiru A.M. Raman I.A.S.
Thiru K. Gnanadesikan I.A.S.
Thiru M.R.B. Punja
Thiru K.V. Ramanathan
Thiru V.D. Shah
Thiru P.R. Sundaravadivelu
4. Indicate whether the proposals relate to the establishment of a new undertaking or a new unit/division
New Unit.
5. Location of the new undertaking
Uthamasolapuram, Nannilam, Thanjavur District, Tamilnadu
6. Capital structure of the proposed undertaking
Not Applicable
7. In case the proposals relate to the production, storage, supply, distribution, marketing or control of any goods/articles, indicate
Production

| | |
|--------------------------------|--|
| i. Name of goods/articles | CAUSTIC SODA |
| ii. Proposed licensed capacity | 100 Tonnes per day |
| iii. Estimated annual Turnover | Rs. 4431.38 lakhs (including Byproducts) |
8. In case the proposals relate to the provisions of any service, state the volume of activity in terms of usual measures such as value, income, turnover, etc
Not Applicable.
9. Cost of the Project
Rs. 94 Crores
10. Schemes of finance, indicating the amounts to be raised from each source
(Rs. in Crores)

| | |
|---|-----------|
| a) Rupee Term Loans from Financial Institutions | 69 |
| b) Internal Generation | 25 |
| | <u>94</u> |

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this notice intimating his views on the proposal and indicating the nature of his interest therein.

Agrarian Structure and Population in India

A Selective Survey

A Dharmalingam

Investigation of aggregate demographic change in a population requires study of different demographic regimes contained in the whole. Demographic forces should also be viewed in the context of overall social development in concrete historical forms. Thus India's post-Independence demography, to be properly understood, must be studied in terms of the class structure and class relations not only of post-Independence India but also of the pre-Independence period under native and foreign economic and political powers.

This paper attempts to interpret India's demographic regime in general and that of the agrarian population in particular in a historical perspective. The agrarian structure and population are examined on the premise of the salience of the social relations of production. The focus is on the historical emergence of the agrarian class in India and the accompanying processes of population change.

I

Introduction

SINCE Independence, India has achieved a remarkable growth in the national product—faster than population—and self-sufficiency in agriculture. In the health and education sphere life expectancy has risen from 32 to 57 years, the literacy level has improved and the higher education sector has expanded. India's advance in science and technology, commitment to integration despite diversities, and far-reaching changes in the legality of the caste system are worth acknowledging [Sen, 1982 41-42].

Despite these achievements, however, one-third of India's population is still in poverty. Three-fifths of the Indians are illiterate. About one out of every ten babies dies before reaching age one and income per capita is among the lowest in the world. High regional disparities persist. As Sen observed, India's achievements were amidst the "extreme injustices heaped upon dreadful inequities" [Sen, 1982 41].

The picture that emerged after three decades of so called planned development was that "mass poverty has increased; unemployment has crossed the mark of 20 million person years. The army of agricultural labourers has grown at a phenomenal rate, and rural indebtedness has gone up. The capitalist path of development is not capable of effecting a radical solution to these basic problems" [Sau, 1981 3]. Added to this grim picture on the economic front is the continuous expansion of population at the rate of around 2 per cent per annum.

The inability to solve some of these basic problems of survival has led one school of thought to put the blame mainly on the growing population. It is argued that the rapid growth of populations breeds poverty.¹ Eradication of poverty, it is claimed, therefore, rests on bringing population growth under control. It is often implied that since it is mainly the poor who contribute to the growth of 'over population' they themselves are responsible for their misery.

The counter argument is that the demographic behaviour of the poor is in

response to, and an effort to avoid, poverty; and that overpopulation, with which poverty is associated, is a result of the interaction of a particular set of institutional arrangements specific to the social milieu which favours high fertility [Caldwell, 1982]. It is a "social rather than a demographic problem" [Brenman, 1989 45]. Lloyd, an Oxford don, expressed this view as early as in 1832.

the simple fact of a country being over populous, by which I mean its population pressing too closely against the means of subsistence, is not, of itself, sufficient evidence that the fault lies in the people themselves, or a proof of the absence of a prudent disposition. The fault may rest, not with them as individuals, but with the constitution of the society, of which they form part [Lloyd, 1968 [1837] 22-23].

It is the pressure on the means of employment and not on the means of subsistence that creates and sustains poverty. From a study of agricultural labourers and poor peasants in West Bengal, Chandra confirms that "it is not so much the numbers within a family but rather the work opportunities available to its able-bodied members and the E/P [number of earners/family size] ratio which are the more important determinants of poverty. Both these factors depend to a considerable extent upon the wider macroeconomic environment." [Chandra, 1983 253-54]. It, therefore, is determined by the internal social relations of production and the unequal exploitative relations with the outside world.

The internal differentiation in a society, however, did not arise by accident. It is the outcome of the contradictions between different social, economic and political forces over the course of time. Thus if one wants to interpret the social reality of present-day India it is necessary to analyse its historical transformation. Transformation takes place when internally contradictory factors interact among themselves or interact in combination with external forces, in a given social and political environment. Thus 'transformation' acquires an empirical content when the different forces involved in that process are studied in a particular historical context, and it becomes abstract

when the forces are extracted from that context.

Investigation of aggregate demographic change in a population, therefore, requires the study of different demographic regimes contained in the whole. Demographic forces should also be viewed in the context of overall social development in concrete historical forms. Thus India's post-Independence demography, to be properly understood, must be studied in terms of the class structure and class relations not only of post-Independence India but also of the pre-Independence period under native and foreign economic and political powers.

In what follows, I attempt to interpret India's demographic regime in general and that of the agrarian population, in particular, in historical perspective. The agrarian structure and population of India are examined on the premise of the salience of the social relations of production.² I focus on the historical emergence of the agrarian class in India and the accompanying processes of population change.

II

Evolution of Agrarian Structure³

The historical process of the increasing interaction of human beings with nature gives rise, at one stage, to a community of differentiated individuals. Observation of transitions between different historical epochs in human life suggests that the power of a heterogeneous mass of people in an agrarian society is largely determined by unequal control over the visible and invisible means of production and reproduction of the society [Godelier, 1977 and 1978, Engels, 1977 5-6].

The following pages present a sketch of India's historical course of agrarian development. For simplicity the conventional periodisation is adopted: the period before the arrival of British colonists in India, the period of official colonial rule, and post colonial India.

PRI COLONIAL PERIOD

Ethnographic materials and inscriptions available show that population concentra-

ment to which natural conditions were con-
suetude to survival. In the absence of
developed techniques of production and
with a stagnant technology, agricultural ac-
tivities centred around the areas where suffi-
cient and sustained water supply was
available. In the absence of adequate tanks
and canals, rainfall was the major source:
the evidence shows a high correlation be-
tween rural population concentration and
amount and frequency of rainfall.

A cursory look into the literature on social
organisation in South India gives the impres-
sion that the appearance and survival of
certain social institutions were facilitated by
the prevailing conditions and relations of
production and exploitation. Stein's [1982:
3-32] analysis of South Indian history in
the mediaeval era showed that the numerical
strength of a powerful peasantry, Hindu
institutions and concentrated Brahman
settlement living on the extracted surplus of
agricultural production were found in areas
where irrigated rice cultivation was
revalent. In these areas there was a hierar-
chical social system in which the Brahmins
occupied the top position and the un-
touchable agrestic labourers the bottom.
Maintaining control over land and labour
and the irrigation system was the prime task
of the commanding groups. Population den-
sity in these areas also appeared to be
relatively high compared to the semi-arid
ones where cultivation depended on rain-
fall and well-water, and higher still than in
the arid zones where the degree of uncertain-
ty was greater. In consequence the command
exercised by the powerful groups was
moderate in the semi-arid areas and very
limited in the dry zones.

Under the above agrarian structure the ex-
tension of irrigation facilities increased the
land under cultivation of the dominant
groups. The consequent increased demand
for labour resulted in the creation of another
exploitative institution, slavery. In thirteenth
century South Arcot, as Vidyasagar notes,
"...with assured irrigation, they [the domi-
nant peasants] were given the legal right to
possess slaves" [Vidyasagar, 1985: 128]. The
slaves were not attached to a particular land-
holding or family. They were commodities
of the dominant community as a whole.
This situation with some alterations seems
to have continued well into the twentieth
century.

The pre-Mughal rulers were no less ex-
ploitative in extracting the agricultural
surplus than the Mughals themselves [Digby,
1982: 59]. In Mughal India land was
available in abundance. The peasants' right
over land was hereditary but if a peasant was
unable to cultivate the land it could be taken
from him and given to another person who
was willing to cultivate. This also made it
possible for the peasants to migrate out and
settle on virgin lands [Habib, 1963: 116].

Villages in Mughal India can be divided
into two categories according to the nature
of their land institutions: 'raiyati' or peasant-
held and zamindari. A zamindari area com-

prised a village or a part of a village in con-
trast to the smaller holdings of 'raiyati' pe-
asant cultivators. The two systems were
mutually exclusive: where one existed, the
other did not. The zamindar collected his
revenue share either by imposing a separate
tax on the peasants or taking part of what
was collected for the nobles. In 'raiyati' areas
the land revenue was collected by the village
headman who was paid a certain percentage
of the revenue as commission or given
revenue-free land for cultivation.

The effectively unlimited availability of
land for cultivation in relation to the popula-
tion meant that everybody who could
cultivate had access to land. This did not,
however, preclude the existence of landless
labourers during that period. These
labourers may have been drawn from the low
castes whose occupation was other than
agricultural, to meet labour demands over
and above the family labour of larger
holdings at peak seasons [Habib, 1963: 121].
This differential capacity of the peasants to
exploit varying amounts of land would, over
a long run, produce a differentiated peasantry
and therefore a heterogeneous village
community. Using the data from records of
poll tax assessment according to the personal
possessions of villagers, Habib [1963: 119-20]
classified a village population into various
social classes. Measured by the value of their
possessions, the zamindars, moneylenders
and grain-merchants constituted Class I,
followed by rich peasants in Class II and the
large majority of the peasants in Class III.
The small peasants whose cultivation was
constrained by availability of credit were
considered as 'indigent'. And, finally, the
lower caste people who worked in the fields
of cultivators and zamindars formed the
agricultural labourer class.

The population of any village community
of course had a high proportion of peasants.
Although peasants may have belonged to
various different castes, in fact each village
seemed to have peasants from only a single
caste, or sub-castes of the same caste. Thus
a Mughal village's self-sufficiency was realis-
ed through hereditary division of labour and
caste-cohesion among peasants [Habib,
1963: 122-3].⁴

Agricultural production in Mughal India
comprised both food and non-food crops.
The implements used in cultivation seem to
have been comparable to those of Europe
at that time. Implements used varied from
the low capital-intensive kind like the
wooden plough with a small iron tooth and
seed-drill, to the kind with high capital in-
tensity like the Persian wheel used to draw
water from wells with the help of draught
animals. Of course, poorer peasants could
not afford the expensive devices in cultiva-
tion. To enrich the soil and preserve its
fertility, fish (along coastal areas) was used
as fertiliser and crops were rotated.

Mobility of peasants on a mass scale to
settle on virgin lands was another important
feature of the peasantry in the Mughals'
time. One of the Mughal kings remarked
that "in Hindustan hamlets and villages—

even towns—are depopulated and set up in
a moment!" [cited in Habib, 1982b: 218].

Reviewing the available material on yields
of different crops, Habib [1982b: 219-25] has
shown that yield per acre of foodgrains
remained almost unchanged between c 1595
and c 1870, that of sugarcane rose and
indigo remained the same. However, owing
to the greater availability of fertile land
during the sixteenth century, the yield per
head may also have been higher than in the
eighteenth and nineteenth centuries. The
richer peasants, with their capacity to choose
among different means of cultivation, could
engage in cash or market crop cultivation
which entailed a higher return than food
grains.

The objective pursued by the Mughal
rulers, of extracting as much surplus as
possible from the labouring masses, led to
a continuous change in the modalities of
land revenue assessment and collection.
Beginning with the system of apportioning
the harvest between the direct producer and
the state or its intermediaries, the system
underwent many alterations. Every suc-
cessive revision of the existing land revenue
system brought more burden to the peasants.
The final form of the revenue system, after
passing through increasingly regressive
modifications, was completely unrelated to
the actual harvest: the peasants were infor-
med in advance of the amount of tax to be
paid at the time of harvesting, computed
from a combination of area sown and
standard tax rate per unit area based on the
fertility of the soil, the crop and past
experience.

The privileged section of the community
consisted of the intermediaries, zamindars
and headmen. This group were allotted large
landholdings for cultivation tax-free or with
nominal tax, putting more pressure on the
small peasants to meet the fiscal necessities
of the ruling class. This discrimination
"must have tended to intensify the
already existing differentiation among the
rural population. The collection in cash
would still further increase such differentia-
tion" [Habib, 1982a: 240].

The agrarian picture in the contemporary
Deccan and south India was not much dif-
ferent from that in Mughal India. The
Marathas in the Deccan were at the zenith
of their power, controlling a vast territory,
during the first half of the eighteenth cen-
tury. Further south the economy was in a
state of disorder and instability due to
infighting among the different local ruling
entities and invasion from outside. This
devastating warfare combined with disas-
trous famine in the 1660s resulted in a
large exodus of people to Jaffna in Ceylon.
The incidence of frequent war, famine and
epidemic diseases in the late eighteenth and
early nineteenth century in the Tamil state
resulted not only in economic stagnation but
also in demographic contraction [Lardinois,
1989]. The general agrarian crisis thus paved
the way for eventual establishment of
colonial rule in south India. It is deduced
from this that "the positive population

growth that we observe in the middle of the nineteenth century partly reflects demographic recovery from the open crisis of the second half of the eighteenth century" [Lardinois, 1989: 33]. The land revenue system, in the Deccan at least, followed a less severe pattern than in the Mughal region. In the south tax was collected with much consideration paid to the type of irrigation, soil and crops.

The cultivation methods (labour-intensive) and agricultural production in south India, as elsewhere, were shaped by the available natural resources. Peak seasonal labour demands for such crop as rice, forced even the marginal peasants to look for exchange labour or employ labourers from the depressed castes who were socially and economically divorced from the means of production. In such circumstances it is not surprising that, according to Kumar's [1965: 181] estimates, agricultural labourers constituted about 10 to 15 per cent of the total population and 17 to 25 per cent of the agricultural population in south India at the beginning of the nineteenth century.

Indian society until the dawn of the nineteenth century can be summarised as follows. The interaction of various social, economic and political forces resulted in a differentiated population. The direct producers, labourers, had not only to maintain themselves but to support the ruling nobles and the intermediaries who collaborated in exploiting the peasants. Concessions made to certain peasant elements in collecting tax revenue stratified the peasantry itself; thus the exploitative productive relations between the direct producers and the dominant class progressively widened the gap between the exploiters and the exploited.

Despite the fact that the living standards of India's population in the sixteenth and seventeenth centuries were comparable to (or even higher than) contemporary European standards, the impact of Mughal rule in India on agricultural development seems to have been insignificant. The general picture of the Indian economy during the Muslim period and the inherent tendencies of the rulers in exploiting the appropriated agricultural surplus that hampered economic growth, have been summarised by Lal [1988: 95-96] as follows:

continuing agricultural stagnation was not altered by any attempt to reinvest the considerable rural surplus extracted by the changing rulers and their functionaries, in productive public works such as widespread irrigation which, by reducing the uncertainty of water supply, would have enabled a shift to more valuable, higher-yielding, but more risky cropping patterns. The surplus was not used for productive investment in industry either, although its expenditure on various luxury goods did lead to the promotion of a wide range of handicrafts and the development of rudimentary 'putting out' system. The general insecurity of any agglomeration of wealth which could be confiscated at the king's pleasure provided strong disincentives for capital accumulation, whilst the continuing disjunction between the economic and

political power of the growing mercantile communities meant that the growth of a vigorous mercantile capitalism, which might have altered the parameters of the Hindu equilibrium, did not occur. Indians therefore continued to earn a standard of living by means which had remained relatively unaltered for nearly 2000 years.

COLONIAL PERIOD

There is broad agreement among scholars of Indian economic history that the effect of two centuries of colonial rule was to disintegrate and disorganise the pre-British social fabric.³ The Indian village before the effective operation of the colonists was self-sufficient, self-contained and self-perpetuating, though to some extent differentiated. The means by which these conditions were altered were the land revenue systems and the economic doctrine of *laissez-faire* and free trade followed by the British.

With the aim of extracting the greatest possible agricultural surplus, the East India Company, after securing revenue-collecting rights, tried to appropriate the fruits of labour without much alteration in the prevailing scheme of revenue collection under the native rulers. Realising that the 'ryots' were much exploited by the revenue officers (zamindars) under the native rulers, the Company intended to collect more from the revenue officers supposedly without affecting the poor 'ryots'. The means was to be permanent settlement: the vesting of secure landholding rights in the hands of some individual; and, as a result, zamindars, being the hereditary revenue officers, were made 'landlords' of India. Wright [1955], one of the critics of the Permanent Settlement system, objected not because the system was exploitative but because it deprived the Company of the additional land revenue which would accrue when cultivation was extended. He admitted that the aim was to "collect the greatest amount". This was possible only by reducing the hereditary revenue collecting officers' share of the revenue derived from the labour of the 'ryots' [Wright, 1955: 205].

Apart from the logic underlying the scheme there seems to have been a belief among the proponents of the revenue system that "a sound administration must have the security of landownership as its basis, and nothing but a Permanent Settlement could ensure this" [Guha, 1963: 17]: a view that appears to have predominated in the formulation of the Permanent Settlement.

Different attempts by the Company to reduce the oppressiveness of the zamindars or to get rid of them proved futile and unsuccessful. Since collecting more revenue was its main purpose the Company came to realise that zamindars were indispensable. Under the Permanent Settlement scheme, the zamindars were, again, reinstated as owners of the soil either in perpetuity or for life. The underlying objects of the settlement were "to confer on the landholder the possession of the district which he occupies, on a fixed and moderate rent; to deprive him

of the power of interfering with the situation of the ryots, in the sums they pay to the state, under the pretext of making an addition to the revenue" [Wright, 1955: 214]. Wright added that "...[the settlement] has been a concession from the British government to the zamindars and to the 'ryots', which they never had been able to obtain under the mildest administration of their native princes" [Wright, 1955: 214].⁶ The pioneer in the creation of the settlement, Lord Cornwallis, recorded his objective plainly, in the following words: "It is immaterial to government what individual possess the land, provided he cultivates it, protects the 'ryots', and pays the public revenue" [Wright, 1955: 212].

The so-devised instrument of appropriation was first introduced in 1793 in Bengal and Bihar and gradually spread to other parts of India.⁷ The Permanent Settlement system seems to have had the expected benefits for the British in the north, but, however meticulously modified to suit the southern Indian peninsula, it did not bring returns to the satisfaction of the colonial government in south India. Consequently the system was abandoned in the south and a new system called 'raiyyatwari' was subsequently developed and introduced. The 'raiyyatwari' system was formulated and shaped by Thomas Munro in Madras and by Elphinstone in Bombay.

Under the 'raiyyatwari' system each field was to be registered and the revenue was collected directly from the 'raiyyat' (cultivator). Unable to meet the heavy revenue demands, the zamindari estates, covering about one-third of the whole area around 1830 in the Madras Presidency, declined over time and were converted into 'raiyyatwari' lands [Kumar, 1965: 10-11]. Land could be bought and sold by any individual.

Although both zamindari and 'raiyyatwari' systems did consider land as a private-property institution, they differed on the issue of in whose hands the land should be given for cultivation. Also in 'raiyyatwari' areas the administrative apparatus had to involve itself continually in assessing and collecting land revenue. Despite the same 'raiyyatwari' revenue system being followed in both Bombay and Madras provinces, there were a few differences between them. "The major difference between the 'raiyyatwari' systems established in Madras and Bombay was that, whereas in Madras the revenue was based on a fraction, usually one-half, of the net produce of the farm, in Bombay the assessment was based on the relative notional yield of the soil, without any consideration of the actual yield" [Bhattacharya, 1979: 33 cited in Lal, 1988: 108].

The increase in revenue demand was always ahead of the increase in area under cultivation. In Muzaffarpur villages of Bengal, for instance, between 1840 and 1888, rents rose, as a result of rise in revenue demand, by 137 per cent while cultivation increased by only 12 per cent [Chaudhuri, 1983: 138]; and in some districts of Assam, in the first half of the nineteenth century,

there was an increase in revenue in spite of stagnant cultivation due to depopulation caused by Burmese aggression and epidemic disease [ibid: 121-2]. The Madras delegate insisted to make an inquiry into the present conditions of 'ryots' in the early 1880s observed about the revenue assessment:

The assessment was very high. Nominally it was said to be one-third of the gross produce, but as a matter of fact it varied in many instances from 40 to 50 per cent of the gross produce... Every 30 years the assessment was revised. Of course revision meant enhancement. There was enhancement every time that revision took place [The Hindu, December 26, 1885, cited in Murdoch, 1886: 51].

Another factor that facilitated the changes in agrarian relations was the active participation of moneylenders in the process of production. In jute growing areas of Bengal, for instance, the impoverished peasants distrusted and resented the exploitative jute traders and moneylenders. The jute slump in the early 1920s led an observer to describe the abysmal conditions of the peasantry in the following way:

The principal reason why the peasants of Bengal are today facing complete ruin is the terrible oppression of the usurious 'mahajan' of Bengal. On the one hand, the usurious 'mahajan', and on the other, the mighty landlords—the combined pressure of these two powerful classes have broken the back of the innocent and simple peasantry of Bengal. [Shah Abdul Hamid cited in Chatterjee, 1982: 25-26]

Rural indebtedness seemed to have been common in areas where single crops prevailed and cultivation of cash crops was encouraged. The credit relations ruined the cultivators in two ways: by causing them to surrender a large part of the product to the creditors and, in the end, to surrender the land through default. This change in control over land through credit created new economic groups of sharecroppers and tenants-at-will. The number of agricultural labourers burgeoned. The chances of land alienation were greater when the creditor was a landlord-cultivator, which was generally the case at the close of the nineteenth century. A settlement officer reported in 1905: "there is hardly a single moneylender in the district who is not a landlord, and many of the landlords, even of agricultural castes, combine the business of money and grain dealer with that of a cultivator" [cited in Strokes, 1983:79].

Examination of different revenue systems took the government well into the 1820s when it successfully introduced the systems in their final form. There were many bad harvests during the 1830s. These developments together with the still underdeveloped transport and communication infrastructure meant that for the first half of the nineteenth century there was not much improvement in agricultural production. Most of India began to recover in the 1840s. The relative prosperity in some regions during the third and fourth quarters of the century brought

new relations of production in agriculture. Dramatic improvement in economic prosperity was accompanied by similarly increased social stratification. Evidence, at least for late-nineteenth century Maharashtra and Madras, has been provided by Charlesworth [1978] and Washbrook [1978] respectively. For instance, in Madras Presidency, at the beginning of the twentieth century, "men who... possessed landed resources twelve or more times greater than the average, stood at the centre of the agrarian economy" [Washbrook, 1978: 72].

The changing institutional framework of agriculture as a result of the destruction of pre-British village communities and domestic industries had also been demonstrated by Patel [1952: 9-68] using raw the census data on occupational distribution up to the second quarter of the twentieth century.⁸ By dividing India into three broad regions Patel highlighted the regional differences in the proportion of agricultural labourers to total labour force in agriculture. The southern region comprising Madras, Bombay and Central Provinces had the largest proportion of agricultural labourers (54 per cent) in 1931, followed by the eastern region (Bengal, Bihar, Orissa and Assam) (33 per cent); the Great North, covering the United Provinces, Punjab and North-West Frontier Province, registered the lowest proportion of agricultural labourers (20 per cent). United Provinces in the north, Bihar and Orissa in the east and Bombay in the south showed the highest levels of agricultural labourers among all states [Patel, 1952: 21-31].

In trying to explain these regional differences in agrarian relations Patel [1952] looked back into the landholding systems in pre-British Indian villages and the changes effected by the social, economic and political policies during the British rule. Patel established a relationship between the prevalence of agricultural labourers in contemporary India and the type of landholding system in pre-British India. One of the two main patterns in which land was held was 'joint village' where land was held jointly by the village community or the village members were co-sharers of a single unit estate. In the second type, called 'raiyyatwari', land was held in separate units by different individuals [Patel, 1952: 35]. The 'raiyyatwari' system, as discussed earlier, was widely observed in central, south and east India while the *joint village* pattern was prevalent in north and western India. Comparing the land system and the level of agricultural labourers, Patel noted:

Broadly speaking... the proportion of agricultural labourers, the group of agricultural population... is the smallest in regions where the *joint village* form prevailed, and the highest where the 'raiyyatwari' village form prevailed. The Eastern Region constitutes a special case, where the proportion of agricultural labourers was closer to that in the Great North (joint village region) at the end of the nineteenth century, but is

closer to that in the Southern Triangle ('raiyyatwari' village) today [Patel, 1952: 37]. After establishing this correlation he examined how the burgeoning agricultural labouring class was effectively created. The decline of the domestic industries in which most of the artisans had worked was effected by the impact of the Industrial Revolution in England and the improvement in transport and communications. This displaced most of the artisans into the ranks of tenants-at-will and agricultural labourers. Deepak Lal says, while not totally agreeing with the radical views on the effects of de-industrialisation during British rule, that "though the thesis of de-industrialisation" of India over the British century does not seem sustainable, it is undeniable that the influx of cheap textiles after the 1820s must have had deleterious effects on the levels of living of Indian handloom workers. The extent of the distress caused is more difficult to assess; anecdotal evidence, such as Sir William Bentinck's famous remark that "the bones of the cotton weavers were bleaching the plains of India", points to widespread distress [Lal, 1988: 184]. Another factor was the disintegration of the peasantry that followed the regressive land revenue system which made easier the alienation of the cultivators from the land.

Thus, by the force and the authority of the British Government in India, millions of cultivators in the three big provinces of Bengal, Bihar and Orissa were transformed, almost overnight, from peasant proprietors into tenants-at-will so many were sacrificed in such a short time so that a few may prosper and rule [Patel, 1952: 44].

Thus in areas where zamindari systems prevailed the indebted cultivators were pushed mainly into being either tenants at-will or sharecroppers and agricultural labourers whereas in 'raiyyatwari' areas most of them became agricultural labourers.

The Southern Triangle where the proportion of agricultural labourers to the total agricultural population was more than forty per cent is the region where the holdings of the cultivators were separate under the raiyyatwari form of village organisation, and were recognised as separate and easily transferable under the land settlements by the British. The Great North where the proportion was below twenty per cent is the region where the joint or communal form of village organisation prevailed and where estates were generally recognised as joint or communal by the British land settlements, thus making it more difficult there, than in the South Triangle, to alienate them. The Eastern Region where this proportion was between 20 and 40 per cent is the hybrid result of superimposing the Zamindari and Settlement on a previously 'raiyyatwari' region with separate holdings, and thus depriving the cultivators of the actual possession of their land. The correlation between the regions demarcated on the basis of the proportion of agricultural labourers and the form of land settlements is so striking that it can hardly be dismissed as purely incidental [Patel, 1952: 65-66].

India's agrarian structure at the time of independence from the British, as it emerged from the impact of the colonial revenue settlement and legal system, can be described as follows: at the top of the ladder was the landlord class with absentee and non-cultivating zamindars dominating in the zamindari region, resident proprietors and cultivating landlords dominating in the 'ryotwari' and 'mahalwari' areas; followed by the trading and moneylending class, and the peasantry: rich peasants, middle peasants, poor peasants and landless. The rural artisans constituted the last stratum.

A major change was brought about in the agrarian scene between the 1950s and 1960s by the 'land reform' legislation. The hardest hit by this measure were the absentee and non-cultivating landlords, from among whom emerged a small group of big landlords. The medium and small landlords in the 'ryotwari' areas managed to retain a major portion of their land by turning themselves into cultivators, though tenancy was practised in a disguised form. Middle peasants benefited to a degree but poor peasants, landless labourers, and artisans and craftsmen gained very little from land reform, or from the other agrarian changes introduced by the government.

The period between independence and the early 1960s was a time of positive changes in forces of production and some increase in commercialisation. These changes, coupled with land reform and an annual growth in agricultural output during this period of about 3 per cent, mostly benefited the rich peasantry [Byres, 1981: 423]. The evidence on agrarian transformation in India after independence gives the impression that a qualitative change was effected in Indian agricultural production from the mid-1960s, the whole process being described as the 'Green Revolution'. The onset of the Green Revolution initiated the transformation to capitalistic production.⁹

The two main components of the Green Revolution introduced in the mid-1960s were biochemical and mechanical innovations. The former were labour-absorbing, land-saving and scale-neutral, the latter were labour-saving and biased towards large-scale farming, and gave rise to a demand for large amounts of fixed capital. The impact of new technology on the agrarian structure between the mid-1960s and the late-1970s was analysed by Byres [1981] in the late 1970s on the then available evidence. The picture projected from this review seems to be one of increasing impoverishment and proletarianisation of poor peasants, landless labourers and craftsmen. This was "a process not initiated but certainly hastened by the operation of the 'new technology'" [Byres, 1981: 432]. Mechanisation in agriculture undoubtedly played a major role in this process. In Punjab and Haryana, among the leading states of India in the Green Revolution, for instance, the compound annual growth of numbers of farm tractors, one of

the elements in mechanisation, was already 17.4 per cent during the pre-new technology period, 1951-1966, and increased to 21.9 per cent during the post-new technology period, 1966-1972 [Ahmed, 1976: 88]. Between 1966 and 1972 the number of tractors used for agricultural purposes in India increased by about 200 per cent [Biswanger, 1978 cited in Byres, 1981: 419]. Meanwhile the proportion of agricultural labourers to total agricultural workers went up from around one quarter in 1961 to about two-fifths in 1971 [Omvedt, 1978: 386]. In Marxian terms, the cumulative effect of the impact of new technology and land reform on agrarian structure was the creation of a powerful class-for-itself rural proletariat by the successful action of the strong class-in-itself rich peasants [Byres, 1981: 435].

In fact the process of proletarianisation of poor peasantry, the shift from family-based subsistence farming to market-oriented hired-labour farming and the increasing diversification of economic and social life in the village, were all operating even in the pre-high-yielding variety (HYV) period. Analysis of the data from 126 village surveys, spread all over India, conducted in the 1950s, led Dasgupta [1975] to conclude that

agricultural modernisation in a situation where the village households differ among themselves in their ability to own and use agricultural inputs, including the most important of those, land... has only aggravated the pre-HYV trend towards landlessness, disparity and stratification of the peasantry, because of its pronounced bias towards rich farmers [Dasgupta, 1975: 1412].

The economic differentiation among the agrarian population becomes clear when one looks into the pattern of distribution of means of production, mainly land. The National Sample Survey (NSS) investigation into the pattern of landholding pertaining to the period 1953-54 and the data from the census of agriculture for the period 1970-71 are very useful in explaining this phenomenon of growing marginalisation of the peasantry. As can be seen from Table 1, in

1953-54, 70 per cent of the area owned belonged to the top 15 per cent of the holdings while the bottom 60 per cent of small holdings accounted for a meagre 6 per cent of the area owned. The medium holdings, the middle 25 per cent, managed to retain about the same proportion of land, 24 per cent. The situation in 1970 appears somewhat improved although the data do not reflect the extent to which small and poor peasants were reduced to landless marginalised labourers.¹⁰

Further evidence on the penetration of capitalist production in agriculture comes from in-depth village studies spread almost all over India. A study on agrarian changes in two villages in Tamil Nadu is illustrative. A close look at Table 2 reveals the process of marginalisation that was in operation from 1916 onwards. In 1976, the big peasants, constituting around 6 per cent of the total households, owned about two-thirds of the total area while the petty peasants, about one-third of the households, had control over only 3 per cent of the land. Though the total area owned and occupied by big peasants declined between 1916 and 1976, the average area held by each big peasant household increased from 29.6 acres in 1916 to 35.0 acres in 1976 [Sivakumar, 1980: A-26].

The village studies by Mamdani in Punjab, and Djurfeldt and Lindberg in Tamil Nadu at the beginning of the 1970s, also showed a high concentration of land in the hands of a few rich peasants. In Mamdani's Manupur village small peasants (owning 0.5 acres of land) owned 15 per cent of the area while their population share was 38 per cent of the total families. The figures for large peasants (17 or more acres) were 30 per cent of land and 11 per cent of families [Mamdani, 1972: 75]. In Tanjore village in Tamil Nadu around 80 per cent of poor farmers (owning less than 2.5 acres) owned 32 per cent of the area whereas the rich farmers (8 acres or more) owned 43 per cent of the area with only 8 per cent of the total households [Djurfeldt and Lindberg, 1975: 153].

TABLE 1: CONCENTRATION OF AREA OWNED AND OPERATED BY CULTIVATING GROUPS, INDIA 1953-54 AND 1970-72 (Per cent)

| | Category* | | | |
|---------------------------------------|------------|--------|------|-----|
| | Well-To-Do | Middle | Poor | All |
| NSS (1953-54) | | | | |
| Holding | 15 | 25 | 60 | 100 |
| Area owned | 70.0 | 24.0 | 6.0 | 100 |
| Area operated | 64.5 | 25.0 | 10.5 | 100 |
| NSS (1971-72) and Agr census (1970-1) | | | | |
| Holding | 15 | 25 | 60 | 100 |
| Area operated (NSS) | 55.0 | 27.5 | 17.5 | 100 |
| Area operated (Agr census) | 60.5 | 26.5 | 13.5 | 100 |

Note: * The agrarian classes were obtained by taking the top 15, middle 25 and the bottom 60 per cent of the households in the Lorenz curve which was derived by plotting the cumulative percentage of holdings ranked by farm size against the cumulative percentage of area commanded by them. The middle category was defined as those households which had land roughly in proportion to their numbers. The cut-off points were chosen in accordance with that category.

a village in Madurai district of Tamil Nadu [Swaminathan, 1988] showed that per capita wealth distribution worsened between 1977 and 1985. Though the poor experienced an increase in real wealth between 1977 and 1985 they became relatively worse off during this period; this happened in spite of the implementation of redistributive policies in the study area. Swaminathan [1988: 2233] argues that increasing land inequality was the main element contributing to the changes in the distribution of wealth. Swaminathan concluded, with regard to the current agrarian structure, that "state intervention in the field of poverty and redistribution has failed to alter the structure of ownership of assets in the village in any substantial way" [Swaminathan, 1988: 2233].

Thus it is evident that Indian agrarian structure has been undergoing increasing transformation towards capitalist production. What Sivakumar observed of the two Tamil villages could be said of all rural India in the late 1970s:

... the system of cultivation through hired labour has become common among the big peasants of 1976. In 1916, 345 acres were leased out by them to the medium peasants and petty peasants, whereas, by 1976, it was only a fraction of that. ... The big peasant is still powerful, but the older system of patronage-clientele is much weakened and changed. The most important indicator of proletarianisation of labour is the decline of the 'padiyal-sukhavasi' [permanent farm servant-tenant] system [Sivakumar, 1980: A-29].

The concentration of means of production leads to "qualitatively distinct types of holdings, which differ in the way their production activity is organised" [Patnaik, 1987: 20]. It not only affects the production strategies of different agrarian classes but, more importantly, effects changes in the

of the population.

III

Changing Demographic Regimes

The previous sections dealt with the changing agrarian structure within different political and economic spheres in India. The demographic situations which the different social structures would have caused to emerge are analysed in the following pages.

It is elementary knowledge that the interaction of the forces of fertility and mortality determine, in the absence of significant inward or outward movements, the demographic structure of the population. The forces of demographic change in turn are shaped by the development of productive forces and relations of production. To the extent that the development of these forces of production and production relations differed over time as between the pre-British period, the colonial period, and the post-independence period, the resultant effect of fertility and mortality on the population would also have been different. The demographic structure of India may be interpreted on the basis of this premise.

In the absence of census counts before 1872, population estimations for the previous periods were carried out by historians and demographers using old records and documents which had information on land, land revenue, etc. The first population estimate of 100 million for 1,600 was arrived at, by Moreland, by making some assumptions on land under cultivation and some other considerations. This figure was modified upward to 125 millions by strengthening some of the weak bases on which Moreland's estimation was founded [Davis, 1951: 24]. A further adjustment by Habib [1982c: 165] raised the estimated figure for 1,600 to "a little over 142 million".

rigid social system was not conducive to change... and she was not apt to start an industrial revolution by herself" [Davis, 1951: 25] led him to expect that outside stimulus was needed to change Indian conditions. While agreeing that change was brought by the British, Raychaudhuri questioned its effect: "Undoubtedly, in terms of administrative efficiency and the law and order situation the nineteenth century was an improvement on earlier periods. It is far from equally clear that this improvement meant a better milieu for agricultural production" [Raychaudhuri, 1968: 89].

As no such stimulus was applied from outside until the British came in 1757 Davis assumed that the population of Mughal India during this period remained unaltered at 125 million and since that period there was 'gradually accelerating' population growth which almost doubled the population to 255 million in 1871 [Davis, 1951: 27]. Commenting on the 'constancy' assumption of Davis as an outcome of his 'enthusiasm for the benefits of British rule', Habib came to the conclusion that

The probability is that the Indian population increased from a little under 150 million in 1,600 to about 200 million in 1,800, thus achieving an increase of slightly above 33 per cent in 200 years. This would mean that the population during the Mughal period did not remain stable though the compound rate of growth, 0.14 per cent per annum, was hardly spectacular and was much lower than the rate attained during the nineteenth century [Habib, 1982c: 167].

The census population counts suffered from problems of incomplete coverage and enumeration for the periods before 1931. Thus using the relatively satisfactory figures for 1931 Davis adjusted the counts for the preceding census. The corrected population figures are given in Table 3.

It is generally agreed among historians and demographers that the growth of population during the nineteenth century was slightly higher than in previous centuries. This improvement was attributed mainly to the complete control of warfare after the arrival of the British and perhaps some improvements in health conditions. Both of these causes have been questioned. The British conquest of India, it is claimed, was achieved after some 60 years of warfare from 1757 to 1818 and the 1850s revolt, "any growth in output resulting from such improvements would, therefore, have to go a long way before the economic *status quo ante bellum* was surpassed" [Raychaudhuri, 1968: 89]. Also the economic effect of law and order depends on their purposes and means of application. Chandra [1968: 46-47] argues that "in fact law and order is a basic necessity not only for economic growth and welfare but also for any systematised exploitation". He added that "rationalised taxation, the pattern of commerce, law and order, and judicial system in time led to an extremely regressive (in every sense of the

TABLE 2: DISTRIBUTION OF LAND AMONG DIFFERENT CLASSES IN ASTHAPURAM KANTHAPURAM (TAMIL NADU), 1916-76 (Per cent)

| Category* | 1916 | 1946-47 | 1976 |
|-------------------------------|------|---------|------|
| Big peasant class | | | |
| Households | 10.2 | 11.7 | 5.4 |
| Land owned | 88.2 | 89.0 | 57.5 |
| Occupational holding | 57.3 | 56.3 | 54.4 |
| Medium peasant class | | | |
| Households | 10.2 | 6.5 | 12.2 |
| Land owned | 9.4 | 6.7 | 14.3 |
| Occupational holding | 19.0 | 12.8 | 17.3 |
| Petty peasant class | | | |
| Households | 31.3 | 32.5 | 27.0 |
| Land owned | 2.4 | 4.3 | 3.6 |
| Occupational holding | 23.7 | 25.6 | 20.9 |
| Landless peasant class | | | |
| Households | 48.3 | 49.3 | 51.0 |
| Land owned | 0.0 | 0.0 | 0.0 |
| Occupational holding | 0.0 | 6.3 | 7.4 |

Note: * Big peasants are those who own over 10 acres of land each and cultivate with the help of hired labour; medium peasants cultivate 5 to 10 acres of land and also rely on hired labour; petty peasants usually occupy holdings of less than 5 acres and own less than 2 acres and tend to rely upon family labour; landless peasants own no agricultural land at all; and landlords are those who own but do not cultivate.

Whatever the differences in the relative population growth during the eighteenth and nineteenth centuries, there was a perceptible increase, in spite of some severe famines, in the 70 years before 1870; and between 1870 and 1920 population growth was halted by higher mortality resulting from famine and disease. In the decades after Independence there was tremendous growth. The main feature of the Indian population at the time of independence was the wide population base, as a result of the 50 per cent increase during the 70-year period before 1941, on which future population increases would take place. Growth was most rapid between 1921 and 1931 with an average annual rate

between 1871 and 1921 it was only 0.6 per cent as a result of disastrous famines and epidemics. Dyson [1989] provides a tentative schematic presentation of different phases of population growth in modern India, which appears to be in close agreement with the available literature and evidence on the historical demography of modern India (see Table 4), albeit camouflaging the regional demographic diversities which have their own historical, social and economic bases.

Demographic transition theory teaches that reduction in mortality as a result of modern technological intervention in health and production will, over an initial period, result in rapid population growth after which

place. It is thus implied that there will be a monotonic decrease in both fertility and mortality. But the birth and death rates for twentieth century India present a somewhat different picture (Table 5).

Before examining twentieth century India it is useful to consider population growth in Mughal and British India. It has been argued that the generational reproduction of the society is intertwined with the social reproduction of the whole system, and that the factors that shape the fertility and mortality forces have different effects on the various social classes.

Thus a given population at a time in history is a combination of heterogeneous groups each contributing to the total increase or decrease at different rates. It is worthwhile in this context to refer to Marx's view on population reproduction (though he did not undertake any detailed analysis of it): "every special historic mode of production has its own special laws of population, historically valid within its limits alone" [Marx, 1912: 645]; and "population is an abstraction if I leave out, for example, the classes of which it is composed. These classes too are an empty phrase if I am not familiar with the elements on which they rest... Thus, if I were to begin with the population, this would be a chaotic conception of the whole" [Marx, 1973: 100]. As quantitative information on these different classes was not available until well into the twentieth century, only qualitative interpretation seems possible.

It was argued in the foregoing sections that British India experienced an increasing differentiation of agrarian society compared to Mughal India. While it is improbable that there was no differentiation at all among the peasantry in the pre-British period, it may be correct that

A hurricane might destroy their crops, or famines and epidemics might reduce the numbers of the population; but, under all the circumstances, the fields remained theirs. Calamities would pass over, and they would start working again with the same zeal. In the misfortune, each member could solidly count on the assistance of his relatives and neighbours, who would rescue him from any difficulties whatever [Kovalyevsky, cited in Patel, 1952: 48].

This system gave way to an environment where concepts like private property, individual rights, and the purchasing power of money emerged; where the survival of the direct producers depended on the exploiters, the government and their creditors. Therefore, with the exception of a proportionately small privileged class, the majority, before the British rule, would have been subjected to the forces of fertility and mortality without much variation. Changes in the total population during the Mughal period would have tended to affect all classes equally.

The earliest birth rates available, though not of high reliability, are for the periods 1820-23 and 1833, for some places near Delhi and central India. If allowance is made for under-reporting of female births (the

Notes: a Habib's (1982c) estimates.

● Davis adjusted the census figures only up to the period 1921.

† Mukherjee's adjusted figures are restricted to the population within the post-1947 Indian territory: in fact it is hard to find any recent population estimation exercise that covers the pre-partition Indian territory as a whole. This means that a direct comparison with the population figures of Davis and the census is not possible; however, the comparison of the decadal growth rates from the three sources indicates that a substantial deviation from each other occurs only for the decade 1881-91.

* The small difference between this and the census figure for the corresponding period is masked by rounding.

TABLE 4: BROAD STAGES OF POPULATION GROWTH IN MODERN INDIA (c 1760-1960)

| Phase | Approximate Period | Population Growth | Social and Other Correlates |
|-------|--------------------|--|---|
| I | c 1760-1820 | Near zero, possibly negative | Wars; economic disruption, social breakdown. |
| II | 1830-1891 | Generally positive, but of unknown magnitude; mortality may have improved compared with phase I. | Recovery from Phase I; fewer wars; increased social and economic stability; economic growth (?) |
| III | 1891-1920 | A reduced rate of growth compared with Phase 2, possibly due to deterioration in mortality. | Increase in epidemics; famines; a period of significant change in the mix of causes determining the overall level of mortality. |
| IV | 1921-1960 | Population growth positive and increasing, as mortality improves. | Increased control over disease and famines; political independence; economic development, etc. |

prevalent sex ratio at birth was 864 females per 1000 males) then the birth rates during that period could be placed in the range 35 to 40 per thousand population [Jenkins, 1827; Henderson, 1836, cited in Visaria and Visaria, 1983: 483]. Comparison of these rates with those prevalent at the beginning of the twentieth century (around 50) shows that the biological maximum level of fertility was not approached until the late nineteenth century.¹¹ There are no reliable estimates for nineteenth century Indian mortality. A rough gauge of health conditions might be given by age specific mortality rates for the European army in Bengal, despite its weakness as a representative of the Indian population. The data for 1830-33 and 1867 are provided in Table 6, seemingly indicating a decline in mortality over the period.

It might be argued that better adaptation of Indians than Europeans to the local climate would have resulted in higher mortality among the Europeans. But it seems that "better adaptation to the local climate did not render them disease-proof" [Ramasubban, 1988: 41]. Thus "the diseases which killed European soldiers were endemic to the country. The general population, too, died from them in large numbers" [Ramasubban, 1988: 39].

TABLE 5: DECADAL DEATH AND BIRTH RATES FOR INDIA

| Midpoint of Decade | Death Rate (Per 1000) | Birth Rate (Per 1000) |
|--------------------|-----------------------|-----------------------|
| 1886 | 41.3 | — |
| 1896 | 44.3 | — |
| 1906 | 42.6 | 49.2 |
| 1916 | 47.2 | 48.1 |
| 1926 | 36.3 | 46.4 |
| 1936 | 31.2 | 45.2 |
| 1946 | 29.2 | 39.9 |
| 1956 | 24.1 | 41.7 |
| 1966 | 18.6 | 40.4 |
| 1973-74* | — | 39.9 |

TABLE 6: DEATH RATES BY AGE FOR EUROPEAN SOLDIERS IN INDIA

| Age | Death Rates Per 1000 Population | |
|----------|---------------------------------|--------|
| | 1830-33 | 1867 |
| 18-20* | 5.8 | 16.7 |
| 21-25 | 34.4 | 26.4 |
| 26-30 | 58.6 | 25.8 |
| 31-35 | 52.2 | |
| 36-45 | 67.8 | 39.2** |
| All ages | 49.9 | 29.5‡ |

Notes: * Persons aged 18-20 consisted of the recruits enlisted in India and the sons of the soldiers of the regiments.

** For the combined age group 31-45.

‡ Cholera alone was responsible for nearly 44 per cent of the total deaths. Death rate for all ages excluding cholera was 16.5 per 1000.

Source: Henderson, in Visaria and Visaria, 1983: 476.

The effect of Western medicine in reducing mortality in nineteenth century India appears to have been very limited. Western medicine was first introduced and found in cities and towns; there was popular resistance to practising it both by the middle and subaltern classes. For instance, the anti-plague measures taken by the colonial administrators during the plague epidemic which began in 1896 seem to have disregarded native culture and sentiments. The masses were against accepting anti-plague Western medicine not only because they were unfamiliar with the recent medical technology but because "Indian values and sentiments were contrasted with the 'indifference and callousness' of Western medicine and the colonial administration" [Arnold, 1987: 62]. The dominant perception of the masses about Western medical practice was that "the body, as in the West, was treated as a secular object, not as sacred territory, as an individual entity, not as an element integral to a wider community. The body, moreover, was exposed not just to the 'gaze' of Western medicine but also to its physical touch, an intrusion of the greatest concern to a society in which touch connoted possession or pollution" [Arnold, 1987: 60]. Given this popular aversion to the use of Western medicine and its limited availability, the contribution of modern medicine in improving mortality conditions would have been negligible.¹² David Arnold succinctly puts the narrow role of Western medicine in changing health conditions in the nineteenth century:

the primary responsibility of Western medicine in India until late in the [19th] century was still to minister to the health of colonisers, not the colonised, except insofar as Indian soldiers, servants, plantation labourers and prostitutes constituted an apparent danger to European well-being. Financial as well as political constraints discouraged the colonial state from a greater degree of medical intervention [Arnold, 1987: 58].

However, on the basis of this and similar fragmentary material, it would be reasonable to infer that fertility and mortality were close to each other among almost all strata of the society during the pre-British period and as a result growth was minimal. It is likely that mortality varied more than fertility across different sections of the society.

In contrast to the above picture, the situation in British and post-independence India was characterised by the interplay of market forces unleashed by the exploiters. If India benefited at all during the British period, it was only a section of the masses that gained. While one section benefited by virtue of their control over productive resources, a progressively increasing marginalised class emerged that had nothing to sell but constrained labour power. The continuous operation of this process, in the long run, created a population broadly stratified into three main classes: at the top were those who ruled and controlled the means of production, in the middle a sizeable proportion of cultivators and poor peasants, and at the

bottom agricultural labourers and poor artisans. Of the three, only the top class, with huge resources at its disposal, took great advantage of exposure to the outside world. The differentiated peasantry also benefited to a lesser extent from the introduction of technological innovations into the society. The class at the bottom rung of the social and economic ladder suffered rather than gained as the Indian economy was connected to the world market.

Given this differentiated social structure, the final outcome of the interaction of fertility and mortality was no longer the cumulative effect of similar experiences of different groups but rather the cumulative effect of different experiences by differing sections. Mortality, fertility and migration all had class-specific impacts on the stratified population. For example, Commander argues that because of poor nutritional status and living standards there was a higher incidence of mortality in famines and epidemics in the nineteenth century among the agricultural labourers, weavers, artisans, and the urban poor because of "lack of work, rather than foodgrain availability" [Commander, 1989: 66]. There is much evidence that, until a society is well advanced on the capitalist path of development, the well-to-do tend to have larger families, due both to higher fertility and to lower mortality than poorer groups. Buchanan observed as early as the 1800s, while travelling through the Indian lands of the British Empire, that the rich had many houses—implying large family size—while the poor lived in small huts with mud walls. He noted that "Rich men, instead of enlarging the house, generally build a number of similar huts in the form of a square, sufficient to accommodate their families, which are always numerous" [Buchanan, 1807: 3].¹³

To the extent that the nutritional intake of poor people is severely affected, it may lower their reproductive capacity by shortening the reproductive span, by way of late menarche¹⁴ in a society where age at marriage and consummation is very low, and through early menopause; and reducing reproductive efficiency: with many pregnancies resulting in miscarriages and stillbirths.¹⁵ It is largely observed that women of lower socio-economic status generally have longer lactational and amenorrhoeic periods. In addition the intentions and economic behaviours (e.g. seasonal and long-term migration and hard economic activities) of the poor are such that they appear to favour their actual fertility being lower. The interaction of all these factors, therefore, tends to keep the fertility of poor families lower than that of the rich [Erich, 1978: 93]. An attempt to answer the question why the poor have small families, led Krishnaiah, after analysing the available literature on the main factors associated with the social reproduction of human populations, to the conclusion that, in the absence of significant birth controls, "a low average size of family among agricultural labourers

and poor peasants arises mainly from high rates of mortality and family formation; and a high average size of family among big landowners from low rates of mortality and a tendency for families to remain undivided" [Krishnaji, 1983: 869; see also Krishnaji, 1980; 1989]. As for the effect of mass-killers like famine and epidemics, regardless of the causes of these events, it is clear that the hardest hit are the economically weak. In accordance with entitlement theory, there are greater chances that the poor will lack purchasing power thereby leaving themselves vulnerable. For instance, the people who died in the Bengal Famine of 1943 were those who "lacked the means to obtain the food that was there" [Sen, 1990: 49; see also Sen, 1981]. This aspect is evident from Table 7.

Thus "a mortality regime in effect is a layering of subregimes" [McNicol, 1984: 7] and the devastating effect of such calamities as famines and epidemics is felt altogether disproportionately by the weakest layers. India's population at the time of independence was very different in composition from what it had been at the end of the nineteenth century. In its passage through the 1950s, India experienced many famines and epidemics, and shed many of its most deprived and depressed people. Loss of these people did not entail the loss of that class itself; rather it was kept alive and expanding by recruitment from above through exploitation.

The post-independence era was a time of ushering in capitalist development in agriculture, which was facilitated by land reform policies, state intervention in offering credit, and the introduction of new technology. This process created over the next two to three decades a burgeoning middle peasantry, a relatively small rich and landlord class, and a moderately large poor-peasant and landless labourer class. Alongwith these categories an urban sector was also developing. One of the main con-

sequences of capitalist development in agriculture was the greater marginalisation of women than men, not only in numbers but in production too. This is evident from the continuous reduction in the population sex ratio (from 955 females per 1000 males in 1921 to 930 in 1971 for India) and the decline in the share of women in the workforce, from 504 per 1000 males in 1901 to 210 in 1971.¹⁶ Sharma contends that "while capitalist relations of production have adversely affected large numbers of rural men, it has been worse for rural women. They are heading towards greater impoverishment as a whole, while the burden falls heaviest on poor women who are getting poorer" [Sharma, 1985: 65]. As women lose their control over the means of production, they are rendered less able to control their reproductive activities.

India's birth rate was 40, its lowest level in the first half of the twentieth century, during the decade 1941-1951. In the next 25 years the rate was well above this minimum and only in 1974 was the same level again reached. It might be argued with caution that this is a striking indication of how the initial stage of capitalist development, owing to its urge for primitive accumulation, leads to a higher birth rate. This may, however, partly be due to improved biological conditions.¹⁷ The development of capitalism destroys certain social institutions which gave traditional security and it fails to provide alternatives. In the period between independence and the mid-1970s India experienced several far-reaching changes. The joint family system which rested on the economic interests of its members was damaged and gave rise to nuclear and extended families as a result of the penetration of capitalism. Development of industrial capitalism attracted the pauperised unemployed and underemployed towards the industrial enclaves. These two changes significantly undermined social security, since individual families could no longer rely on the village communities and joint families. In the absence of an alternative for social security, which industrial capitalism, in its primitive accumulation stage, does not supply, the worker is left with no option but to invest in children. Also in the absence of capital-intensive investment, accumulation is possible only through super-exploitation of labour.¹⁸ This leaves the labourers in a position where the wage becomes insufficient to reproduce their labour and to maintain their members in the next generation. Thus sustenance of the workers' own lives and reproduction of the next generation requires additional income. The only option open to and within the reach of the workers to earn extra income is through their children; thus they invest in children and ensure that they start earning at a very early age. Caldwell says that "the conflict between familial morality, suited to familial production, and extra-familial morality, suited to the capitalist labour market, can be extreme during periods of transition" [Caldwell, 1982: 212] and he has further remarked that

High Fertility helped: It emphasised the female role, it kept the mother tied to the home, and it supplied her with extra helpers. Capitalism could hardly do anything but approve; it was able to obtain a man's labour for lower wages than would have been needed by his family to obtain all their needs directly from the market [Caldwell, 1982: 213].

Land reform made available some land for the landless and poor peasants; and the Green Revolution increased productivity of land and labour.¹⁹ These improved conditions made the whole rural environment relatively prosperous compared to the pre-independence period. These developments had some positive effects in raising the fertility (by way of improved reproductive capacity) and lowering the mortality of the population.²⁰

However, these effects were not uniform, but varied according to the class position of different sections of the society. Available village studies show that family size is positively correlated with economic class. One of the main reasons for this is that prolonged lactation lengthens the spacing between births and thereby reduces the total number of children ever born. Evidence from Bangladesh [Huffman et al, 1978: 254] illustrates this phenomenon (see Table 8).²¹

Other factors being equal, this implies that when socio-economic status is low the number of children ever born to a family is expected to be low. The earliest study that was particularly aimed at investigating the relationship between socio-economic status and fertility in India was conducted in the mid-1930s in Punjab state, covering a large area [Jain, 1939].²² This study found a positive association between fertility and social and economic status of different groups of people. Agriculturists seemed to have higher 'fertility' and 'effective fertility' than non-agriculturists. Though the menial class had a fertility level close to that of non-agriculturists their effective fertility was the lowest because of many infant deaths. The numbers of live births per 100 couples of 20 years of marriage duration for agriculturists, non-agriculturists and menial class were 507, 499, and 501 respectively and the numbers of children surviving were 348, 330, and 318 for the three social groups [Jain, 1939: 8]. The differences became clear when the economic differentiation within these three social groups was considered. Division of agriculturists and non-agriculturists into three broad economic classes, upper, middle and lower, showed that the upper class in both groups tended to have a higher level of fertility and effective fertility than the lowest class. It was noted that

the differences in each class are purely economic. Owing to the greater care which the richer class can afford to bestow on children, the survival rate is higher as compared to the poorer class. Thus, at present, the upper classes are contributing to the next generation more than the poorer ones [Jain, 1939: 18].

in the early 1930s, has been hailed as a pioneering work. It showed the continuation of the picture of the interrelationship between social structure and fertility observed in Punjab about one and a half decades previously. Economic status, which was mainly determined by control over and access to landholding in the rural areas, was found to have positive relationship, though sometimes weak, both with children ever born [United Nations (UN), 1961: 124], a measure of completed fertility and with birth rates for currently married women in the reproductive age groups [UN, 1961: 86]. However, the expected inverse relationship between fertility and economic status in urban areas was not strong when average number of children born was considered as a measure of fertility, but was appreciable when current fertility was used [UN, 1961: 128].

A study conducted in central India in 1958 also found a positive relationship between landholding size and fertility. The rich peasants had an average of 4.8 children compared to 4.3 children for the poor peasants [Driver, 1963: 97]. This became very significant when the mean number of living children was considered. The child loss experienced by small peasants was 20 per cent higher than that of rich peasants which led Driver to state that 'land ownership groups differ more in their average number of living children than in mean fertility' [Driver 1963: 110].

Djurfeldt and Lindberg [1980: 108] showed from a south Indian village study in the early 70s, that the average number of births per wife increases with increasing command over the main means of production in rural India. The 27th Round National Sample Survey conducted in 1972-73 showed that average family size was inversely related with per capita expenditure and directly with total household expenditure [Visaria, 1980]. Relevant information for the two states Gujarat and Maharashtra are provided in Table 9.

Mamdani [1972] observed a similar relationship in a Punjab village. 'A village study from central Java showed a positive association between fertility and income level [Hull and Hull, 1977: 50] and ownership of land [Singarimbun and Manning, 1974: 117]. In Bangladesh a positive landholding fertility relationship was found for the early 1970s [Latt and Chowdhury 1977, Stoekel and Chowdhury, 1980: 521]. However, Cain [1978: 435] observed a curvilinear relationship: the poor had smaller families than the rich, but the medium class had higher fertility than either.

In India, high priority was given to the family planning programme in the late 1960s and it has been implemented vigorously since then. Linking the family planning programme with child and maternal health programmes was a recent development. In the initial phases, the family planning programme was implemented in isolation despite a high level of infant and child mortality. The family planning programme was deemed to create a demand for contracep-

tives rather than a response to an inherent demand in the population: it was imposed from the top rather than meeting a demand from the bottom-up. The Indian government's ambitious policy of attaining a low population growth rate, without considering the unfavourable material realities, may have been influenced by the views of prominent population experts of the time, such as Hauser, who said ^{24 25}

The most serious aspect of the whole question [population-growth in countries of the third world] is that failure to control the depressing effect of rapid population increase on economic development would bring a tremendous threat. The issue could be crucial in determining whether we have peace or war in this century, and may determine the outcome of the cold war. You can be sure that if nations remain hungry, frustrated, and unable to achieve their objectives they will be susceptible to the blandishment of communist messages to the low income countries, to wit, (1) the capitalist nations stole your birth right, (2) try the communist way which is quicker and slicker [Hauser, 1966: 34].

Even such a renowned demographer as Kingsley Davis was vulnerable to the then prevailing international political climate. He cautioned against the low weight attached to the population front in United States economic aid packages to the so-called third world countries so as to keep the spread of communism in check. He noted that

what the United States would like to see them [leaders of underdeveloped countries] do is to foster peaceful and democratic industrialisation, a rising level of living and in general adherence to our side. To this end we have given or lent money for agriculture, industry, transportation, public health and arms. We have maintained that this is an effective way to head off communism because, as we say, chronic poverty breeds communism. This reasoning has much to commend it, but it ignores population trends and thus runs the danger of underestimating or misinterpreting the requirements for economic development [Davis, 1958: 296 cited in Hodgson, 1988].

Whatever was the motivation [for the factors underlying that motivation] behind giving a major boost to the programme, its success was minimal until the late 1970s but it gathered momentum in the 1980s. Apart

from the not very significant level of contraceptive acceptance, the demographic characteristics (age structure and parity, for instance) of the acceptors were too poor to make any considerable reduction in birth rates ²⁶. Given the infant mortality rate of 132 for India in 1980 (some states had a rate of around 175), the rates for the 1960s and 1970s must have been higher and that would have strongly discouraged accepting birth control. The all India family planning survey conducted in 1970 showed that fertility regulation was strongly linked with child survival particularly in the early stage of demographic transition while the mean number of children ever born to currently married women in the age group 35-44 was 5.34 for both Group A (states in 'early transition') and Group B (states 'further advanced in the transition'). Group B experienced a higher level of child survival, 4.25 children, than Group A, 3.94 children (Jejeebhoy, 1984: 193).

The majority of the acceptors were poor and had had as many children as they could. Schenk showed for a district in Gujarat, for the period 1971-72 that the taluks with higher concentrations of tribal population had higher sterilisation rates [Schenk, 1973: 74-78]. Table 10 gives the incomes of the sterilised males in Bulsar district of Gujarat for the period November 15, 1971 to January 15, 1972.

Thus concentration of family planning acceptance among the people whose material conditions did not anyway allow them to have the biological maximum fertility and at the later reproductive ages when peak rates of childbearing had already passed,

TABLE 10. RELATIONSHIP BETWEEN ECONOMIC STATUS AND FAMILY PLANNING ACCEPTANCE: RURAL GUJARAT 1972

could not make any considerable dent in the birth rate before the 1980s. A follow-up study of sterilisation acceptors in a mass camp in Trivandrum in 1972 showed that about 32 per cent of those contacted reported that the large sum of money offered to acceptors was the motivating factor for their acceptance of family planning [cited in Basu, 1986: 273]. A follow up study of vasectomy acceptors in Tamil Nadu in the 1960s showed that 43 per cent of the 297 cases had undergone the operation solely for monetary incentive, 4 per cent gave in to pressure from the canvasser and about 37 per cent of the vasectomies were unnecessary in terms of the acceptors' demographic characteristics [Srinivasan and Kachirayan, 1968]. Another study from Delhi found that about 10 per cent of the 265 vasectomised cases were unmarried [Kapoor and Chandhoke, 1963 cited in Pareek and Rao, 1974: 141]. This provides further evidence for the poor economic conditions and the absence of voluntary aspirations for birth control on the part of the acceptors. The Bangalore Population Study conducted in 1975, covering roughly the same area as the Mysore Population Study after a lapse of 24 years, showed that decline in marital fertility was experienced only among women aged over 30 years and that the family planning acceptors (mostly sterilised) over the last 24 years contributed only a meagre 10 per cent reduction in the marital fertility rate below what it would have been had their fertility been the same as the non acceptors' [Srinivasan *et al.* 1978: 263]. Nor, given its numerical smallness, could the urban population contribute to any perceptible reduction in the birth rate. Moreover the urban workers were less than highly receptive to family planning messages since they needed a relatively large family size to reproduce the labour power and the family. In the 1960s in Bombay, families belonging to the lower and lower middle class considered that a family should have an average ideal size of 4.2 children [Rai and Kamitkar 1976: 315]. On the basis of another survey of 300 households in Bombay in 1970 Michaelson [1981] argued that family size among the urban poor tended to be large because the factors that structure the urban birth rates are not much different from the rural context. "When the rural family moves to Bombay or when generation after generation of 'hutment colony' dwellers reproduce their labour

power under near-starvation conditions, their structural position in the capitalist economy and the choices that they face remain very much the same as for those who remain in the countryside" [Michaelson, 1981: 108]. Even among the poor, Michaelson noted that men and women with more casual employment tended to have a larger family size than the blue collar workers in factories and other 'formal' work contexts. In Madras among the slum dwellers fertility was 43 per cent higher than in the non-slum areas, and in Calcutta the corresponding difference was 20 per cent [Singh and de Souza, 1980: 27]. Thus the fertility of the lower socio-economic groups in urban areas was regulated to a larger extent by capital, because its primitive accumulation depended greatly upon the exploitation of human power. The birth rate time series for Madras city during the 1950s and 1960s provides another illustration of this (see Table 11).²⁶

The effect of falling mortality in motivating the people to curtail fertility was very insignificant during the decades preceding the 1980s, partly because the majority of the women in the reproductive age groups were born during and survived through high mortality regimes. Also the initial decline in mortality was first experienced by the well to do in the rural areas and the urban population.

Thus in the first three decades of independence, India experienced higher population growth due not only to reduction in the death rate but also to increase in fertility. My reading of the evidence suggests that the higher birth rate was articulated in the urban sector primarily by the laws of primitive accumulation of capital, whereas in the rural areas it came from improved economic conditions excluding the lowest socio-economic class. The destruction of some social institutions which played traditional roles in rural communities, as capitalist production gradually penetrated into agriculture, increased the importance of having a large family. The lagging effect of mortality decline took a longer time to induce change in fertility. Also however significant the level of prevalence of contraceptive use to family planning programme officials, it has had very little impact on actual fertility because the future potential fertility of the users was quite insignificant. Though capitalism is associated with low fertility, a change from the familial to the capitalist mode of production does not necessarily entail an immediate change in fertility, indeed change in fertility behaviour in a changed mode of production is dependent upon the speed with which certain superstructures that shape fertility behaviour have been altered by changes in the economic structure. Thus Caldwell [1982: 207] argues that

It is indisputable that a settled, largely subsistence economy based predominantly on familial production will be one with high fertility (except where there are pathological

problems), and that it is inevitable that a capitalist society with a fully developed labour market producing nearly all goods and services would be one where fertility is low. It is not the tautology that is important for our times, but the question whether there can be lags or accelerations in the chain from the material forces of production to the modes of production to such parts of superstructure as family structure and fertility behaviour, and whether imported social concepts can change the local superstructure at a different rate than would have been dictated solely by the movement of the economic base in a culturally autonomous society. The critical change is one which extends so far that high fertility is no longer economic.

Political economists argue that the 1960s and 1970s were the period of agricultural capitalism. These two decades saw the enthusiastic participation of the state in promoting capitalism in agriculture. It was also hoped that the agricultural surplus thus derived would be used to stimulate industrial capitalism. Industrialisation, stagnant during the 1960s and early 1970s, gained momentum in the late 1970s. Some argue that it was the failure of capitalist development in agriculture to induce industrial expansion that forced the government in 1975 to bring in the Emergency so as to help foster industrial capitalism [Sathyamurthy, 1986: 42-43].

In the late 1970s and 1980s there were many other social and economic changes. The proportion urban of the total population increased by a fifth during the decade 1971-81 (20 per cent to 24 per cent) compared to 11 per cent during the previous decade (18 per cent to 20 per cent). Similarly literacy experienced greater improvement and age at marriage a greater rise than in the previous decade. The effects of industrialisation and an expanding market economy combined with the government's positive discrimination in the fields of education and employment in favour of the socially deprived classes in making possible occupational and social mobility among the so called lower caste groups—however limited the success could be—cannot be ignored when consideration is given to the broader social changes that have taken place in post Independence India.²⁹

In this period there was also change in approaches toward family planning motivation. Family planning programmes became very strongly related to the health and welfare of the mother and the child. Consequently there was an increase in the use of programme supplied family planning services. Another factor motivating couples to choose a smaller family size was the fact that couples in the potential reproductive age groups were born during an era of declining mortality.

Though fertility and the birth rate declined and have continued declining for India as a whole, the level still remains high. The Total Fertility Rate of 5.5 in 1972 declined to 4.3 in 1978, a reduction of around 22 per cent. The estimated Total Fertility Rate for

the period 1963-70 is 3.7. The urban decline was larger than the rural decline, this is not surprising, given the higher level of education in urban areas, and the felt need to invest in quality rather than quantity of children which was brought about by the combined effect of social change and the values of the market economy. Among the three broad classes in rural society a further substantial reduction in fertility could be expected if family size were to be curtailed by the middle group — those with sufficient land for subsistence. This is the largest group in the rural area after the agricultural labourers and it is this group which does not feel much pressure to have small families. A sample survey of 12 villages in rural Bihar during 1981-83 shows that in comparison to other rural classes the middle peasant class has a large average number of live births, a low propensity to use contraception and low rate of child mortality (Table 12) [Rodgers et al. 1989].

Another study on determinants of fertility decline conducted around the same time in rural Karnataka showed that while the increase in the ownership of land had a positive effect on marital fertility during 1960-69, it changed to a weak curvilinear relationship during 1975-79 [Bhaskara Rao et al. 1986] as given in Table 13.

A study from Nepal showed that the land owners who had rented in land (who form the middle peasant class) had larger actual and desired number of children ever born than both land owners who had not rented in land and landless families [Nijima 1989]. Hull and Hull [1977: 46] observed an inverted U-shaped relationship between education and fertility of women in Indonesia using 1971 census data. Since there was high correlation between economic position and educational attainment, particularly during the period of low overall literacy level, they proceeded to establish the same relationship by approximating economic class with educational class. However, evidence from the 1973 Fertility Mortality Sample Survey supports the relationship only for Bali and rural Sulawesi in Indonesia [Hull and Hull 1977: 48].

The groups at the two extremes, the rich and the poor, adopt family planning to reduce family size though for different reasons. While the rich follow the consumption and life style of the urban population which encourages them to have few children, the poor do not want to have many children because they cannot provide the minimum necessities for survival. This constraint on the poor comes both from the restricted employment opportunities in the rural areas and the limited absorbing capacity of the urban sector which undermines migration prospects. Basu [1986] shows for Kerala (using data for 1971) that the major decline in fertility was disproportionately contributed by assetless poor wage earners among whom was observed a higher level of family planning acceptance. As the wage earning proletariat among the working population increases, as was the case in Kerala between

the 1971 and 1981 censuses, "the consequent increase in the absolute level of family planning augurs well for a continued fall in fertility in the State" [Basu, 1986: 270]. The greater tendency among the poor, particularly those divorced from the means of production, to prefer a small family is not just due to their poor economic status but is supported by their proletarianisation. "It is not their poverty *per se* but poverty coupled with the status of wage earning rather than being self employed which provides the conditions for decline in fertility" [Basu, 1986: 279]. Basu conjectures that "it is likely that wage labourers in other States are also more motivated to limit fertility than the self employed poor but their relatively small proportions reduce their impact on overall fertility declines in their States, and they are also less handicapped by the other limitations on child employment existing in Kerala" [Basu 1986: 279]. Basu's argument was supported by a micro level study in Kerala by Mencher [1980], who argued that agricultural labourers in Kerala in the beginning of the 1980s preferred fewer children because large family size was no longer economically advantageous as a result of increased pressure on employment opportunities particularly in agriculture.

In fact the curvilinear relationship between fertility and economic class was proposed as early as 1961 by Gupta and Malakar [1963] and was reiterated by Rao [1976]. Gupta and Malakar used the National Sample Survey data for rural areas (seventh round) conducted in the early 1950s, to test their hypotheses. As is shown in Table 14 in four of the six zones the relationship seems to hold.

Rao hypothesised that the desired number of children tend to be highest in the case of groups whose source of income is family employment, next come the wage earners, then the professionals and then property owners in that order [Rao 1976: 1153]. He argued that the main discriminating factor

in determining the desired number of children between groups is the strength of the motivation related to children as a source of future income since the income stream associated with a child in the peasants' and *petit bourgeois* class would be higher than in the workers class (landless labourers in rural areas and industrial manual workers in urban areas), agricultural farmers' and industrialists' class and professional class. In the final analysis, therefore, the net motivation for having many children may be strongest in peasant and self employed class and weakest in capital of industrialists and landlords class [Rao 1976: 1157]. The results of Gupta and Malakar's [1963] analysis and Sharmas [1969] Allahabad study were used by Rao to evaluate his hypotheses. In Bangladesh in the mid 1970s Cain [1978: 435] found the same relationship between mean number of live births and landholding. However before arriving at strong conclusion it is essential to must check other factors in support of these arguments.

This can be argued that the relation in the fertility rates is contributed chiefly by one third of the population living in urban areas and by the rich and the poorest in the rural areas. The middle rural group of self-sufficient rural labourers tend to have children because of the inability to increase agricultural production with just the traditional chemical technology and by restricting the

Note: * The current number of live and surviving births was adjusted from a quadratic regression on age. It was assumed that the relationship between fertility and age could be treated as independent of relationship between fertility and other variables and the relationship between live birth and age was then applied to predicted live births at age 45 giving an estimate of completed fertility.

N = Number of ever married women

Source: Rodgers et al. 1989: 31

mechanisation which the rich peasants can afford to adopt and find profitable to use; also they seem to employ the 'diversification' strategy of some children continuing the family occupation and some seeking employment in non agricultural avenues.

Despite the increasing use of contraceptives the Indian birth rate continues to be comparatively high. One of the major demographic explanations for this apparent inconsistency can be seen in Table 15, which shows that more than 60 per cent of sterilisations (the major form of contraception in use) are to women who have at least four living children.

The future potential for further reduction in family size rests both on improvements in the demographic characteristics of the acceptors of family planning methods and on making available other birth limiting spacing methods which are as yet being used only by a negligible proportion of eligible couples. Needless to say, any drive for higher acceptance of family planning must be accompanied by social justice in other spheres of life which would eventually instil a sense of responsibility and make the social environment conducive to limiting family size.

IV

Conclusion

A proper understanding of the population structure of present day India makes an analysis of its evolution and growth in an historical perspective imperative. The characteristics of population growth are conditioned by the nature of the relationships that prevail in the process of social production. The production of the means of subsistence and reproduction of people are two interrelated processes conditioned by the economic nature and cultural configuration of the society [Meillassoux, 1981, 1983, Seccombe, 1986]. Reproduction in a broader sense means that the very conditions of existence are reproduced and biological reproduction is a contingency always determined relative to the dominant relations of production and social formation in which it takes place [Brenner, 1976, Rapp, 1977: 319, Sundaram, n.d.]. It is therefore important to recognise that population reproduction is part of social reproduction of the whole society and so these two are largely inseparable.

The Indian agrarian economy underwent distinctive changes in its various economic and political regimes. If development means development of the direct producers, then, during the colonial period, there was economic change in agriculture but no development for the peasantry. However, as this change benefited a small section which lived on the labour of others, it resulted in a widening differentiation among the peasantry. That differentiation would have had its effect on the demographic behaviour of the population at different levels according to their degree of control over their means of production and over their labour.

Post independence India experienced and

is experiencing the ushering in of a capitalistic path of development, both in agriculture and industry. Industrial capitalism lagged in its development because the fruits of the development of agrarian capitalism did not flow back into the industrial sector. The improvement in mortality unevenly affected the different classes of the society, as a result the indirect effect of mortality reduction on fertility was slow and slight.¹¹ The increased birth rate during the first two and a half decades of independence was mainly due to the destruction of the traditional social security system and improved mortality conditions. The very significant effect of the family planning programme during this period was because the programme was based on concepts which ignored social reality.

The reduction in fertility in the recent period was contributed mainly by the rich and poor sections of the society, but motivated by different material and social considerations. Though this was basically the outcome of capitalistic development, the trend was helped by improvements in education, infant health, and linkage of the family planning programme with the maternal and child health programme. Although there was an increase in the use of contraception this has not made any considerable reduction in the birth rate because the demographic characteristics (i.e. future potential fertility) of the majority of the rural acceptors were poor and also because of a larger population in the reproductive age groups.

India has already attained self sufficiency in food production though that does not en-

sure relief from poverty and even starvation. The pressure of population is on the means of employment rather than on the means of subsistence. Though a sudden change in population growth seems implausible given the wider population base, it seems important to persuade the self-sufficient peasantry—now with a larger number of live births than the other groups—to adopt a small family norm. Both rich and poor appear now to desire to reduce family size, although for qualitatively different considerations. A drastic decline in fertility seems improbable given the higher level of infant and adult mortality and illiteracy among the economically and socially weak sections of the population.¹² As Banerji argued

population growth is not perceived as a threat by the bottom half of the population of the country who constitute some 400 million people. These people have been virtually

by-passed in the development activities of the past four decades. They suffer from hunger; they live in the most degrading conditions; they have virtually no access to health and education services, there is blatant social, economic and political discrimination against them; they have not much to look forward to, nor do they see much of a future for their children and grandchildren. How can such a group of people have a stake in a system which has treated them so harshly? [Banerji, 1989: 52].

However, given the material environment and demographic conditions, the high birth rate and hence the growth rate may be brought to a lower level as the economy ushers in capitalism.³¹ But will it solve the basic problems of the exploited? Robert Cassen expressed it in the following words: "Rapid population growth is not a time bomb but a treadmill. It postpones the day when most people in India can enjoy an agreeable life; but that day could be brought nearer or postponed still further by many other things besides demographic change" [Cassen, 1978: 330].

Notes

[I am indebted to Geoffrey McNicoll, John Caldwell and Gavin Jones for their constructive comments and criticisms. Valuable comments from Ian Diamond and K P Kalrajan, and editorial assistance from Wendy Cosford, are gratefully acknowledged.]

- 1 In contrast the economist Deepak Lal argues that "the population growth which has occurred since 1921, far from having damaged Indian economic prospects, has probably been a major stimulant to agricultural growth, and that the small increase in the rate of growth of per capita incomes in post- as compared with pre-independence India is in part due to this alteration of one of the major parameters of the Hindu equilibrium" [Lal, 1988: 291].
- 2 Rudra [1988] argues that history can be studied more fruitfully if it is divided into epochs corresponding to different dominant relations of production than to dominant mode of production.
- 3 The account of agrarian relations presented in the following sections on colonial and pre-colonial India has mainly depended on literature from relevant materials in *Cambridge Economic History of India*, volume 1, edited by Tapan Raychaudhuri and Irfan Habib and *Cambridge Economic History of India*, volume 2, edited by Dharma Kumar and Meghnad Desai.
- 4 Lal [1988] argues that one of the reasons why the caste system continued unaltered into twentieth century India was the relative stability of population size. Various population estimates for the periods around 350 BC and around 1600 put the population total in the range of 100 to 125 million. As these two periods were times of relative prosperity, peace and stability in Indian history, the estimated population figures therefore "reflect the 'equilibrium' population which the social and economic system could support with available technology. There were likely to have been large deviations

around this 'equilibrium' level over the centuries, due to the four horsemen of the Apocalypse—famine, disease, pestilence, and war" [Lal, 1988: 34].

- 5 Lal [1988] is an exception. He argues that the environmental parameters, particularly social and ecological parameters, which defined what he calls the 'Hindu Equilibrium' in the beginning of the Christian era were left unaffected by the impact of foreign regimes, first by the Muslims and later by the British. Thus it is this unaltered equilibrium rather than the failure of the economic policies of the invading rulers that sustained India's economic stagnation well into the twentieth century [Lal, 1988].
- 6 Wright quotes this point from Bruce [1793].
- 7 See Guha [1963] for a detailed discussion on the origins of the intellectual ideas which went into the making of Permanent Settlement and the gestation period it took before attaining its near-completed form in 1793.
- 8 It may be noted that though the magnitude of the increase in agricultural labourers could be questioned owing to the shortcomings in the data quality, the direction of change seems plausible.
- 9 Existence of wage labour in pre-independence India did not give a fillip to capitalistic development in agriculture because it was only a necessary but not sufficient condition [Patnaik, 1971]. Some scholars were of the view that the accumulated surplus in the pre-independence period, did not flow back to stimulate capitalist production in agriculture [Sathyamurthy, 1986].
- 10 Increasing population over this period would have led to some increase in landlessness. This could have been counteracted by the splitting up of the large farms. A village study from Kerala showed lower rates of partitioning at the upper end of the landholding size [cited in Panikar et al, 1978: 47].
- 11 Davis [1951: 69] estimates a birth rate of 49 per 1000 population for the period 1881-91 for India as a whole. According to another estimate for the same period, cited in Davis [1951:68], the three provinces Bengal, Bombay and Madras actually had birth rates of above 50 whereas the provinces Punjab and United Provinces had rates between 45 and 47 per 1000 population.
- 12 The effect of 'modern' medicine in reducing mortality in Western countries in the nineteenth century has been strongly debated. McKeown contends that "the advance in health since the eighteenth century has been due to: a rising standard of living, from about 1770; sanitary measures, from 1870; and therapy during the twentieth century" [McKeown, 1965: 58]. For detailed discussion see McKeown [1965: 39-58, 1976 and 1979].
- 13 But 'large families' may also result from more co-resident kin and farm-servants living nearby.
- 14 While the high correlation between nutritional intake and age at menarche is acknowledged, its substantial effect on fertility performance has been questioned by many. Bongaarts argues that "substantial changes in age at menarche following improvements in nutrition can be expected to raise fertility by at most a small percentage"

[1980: 566]. However, based on Bongaarts's review findings, another review noted that "There is strong evidence that poor nutrition can delay menarche from the average age of 12 to 13 years seen in well-nourished adolescents to about 19 years at the extreme upper limit in poorly nourished populations" [Zeitlin et al, 1982: 34].

- 15 Apart from late menarche and early menopause nutrition also affects fertility through adolescent and premenopause sterility. For an excellent discussion of the related issues see Nag [1968].
- 16 The decline could also be influenced by changes in definition and classification of occupational categories especially for females. However, the figures quoted are adjusted for such changes.
- 17 The rise in birth rate between 1940 and 1960 in Latin American countries, for instance, was not due to the insignificant impact of population-control programmes, which was insignificant, but rather caused by improvement in health and reduction in mortality [Davis, 1967: 734]. The increased marital fertility in the age groups below 30 between the period 1951 and 1975 in the Mysore Population Study area in India provides more evidence for this phenomenon [see Srinivasan et al, 1978]. Using the data available at two points of time (1959 and 1972) Srinivasan and Jejeebhoy [1981] showed that there was an increase in natural fertility between 1959 and 1972 in almost all states in India.
- 18 Super-exploitation may be defined as a situation in which the wages do not even cover the cost of reproduction of necessary labour.
- 19 However, the introduction of large-scale mechanisation, despite the increased labour productivity, led to the displacement of labour.
- 20 Mukerji [1985], for instance, illustrates with Korean and Sri Lankan fertility data, how reduction in maternal mortality alone, as a result of general improvement in health conditions, can increase fertility rates. The main factors that were found to have influenced the increase in fertility in the early stages of modernisation in the central African state of Zaire are a considerable reduction in the proportion of childless women in the population due to improved health conditions, weakening of the traditional custom of post-natal abstinence and shortening of breastfeeding duration [Romaniuk, 1980].
- 21 However, after reviewing available evidence, Gray [1983: 143] notes that "...if nutrition influences lactational amenorrhea, the effect is, in general, relatively small".
- 22 Information was collected from about 20,000 rural families widely spread over 275 villages in 25 districts of the Punjab state. For further details see Jain [1939].
- 23 In contrast to the studies cited in support of the positive association between fertility and class position, a study from rural Baroda district of Gujarat showed that households in the lower socio-economic class had an average of 0.5 children more than the average for the upper class. The difference was more pronounced in the case of urban than in rural Baroda [PRCB, 1979: 4-8].

- 24 In fact it can be argued that the development and existence of particular paradigms that tend to give rise to specific views are influenced by the dominant political and economic structure in the society. As Castles put it in unambiguous terms, "social science plays an important part in helping to define issues and indicate policies. Of course, the choice of which type of social science is to be funded still lies with those with political and economic power, so it is not a question of the best paradigm influencing policy. Rather, shifts in political and economic and social forces determine the predominance of social science paradigms" [Castles, 1987, p. 1].
- 25 See Hodder [1988] for a discussion of the possible effect of the mid-century cold war between the superpowers in influencing the American development policy to advocate the adoption of fertility control programme in the uncommitted Third World states to reduce population growth without the need to wait for industrialisation.
- 26 The two all India family planning surveys conducted in 1971 and 1980 revealed that the proportion of women in contraceptive use increased from 10 per cent in 1971 to about 78 per cent in 1980 [Khan and Prasad, 1985, 319].
- 27 See Kondees [1981, 33-46] for a review of poverty related determinants of fertility.
- 28 In an attempt to give a demographic explanation for this phenomenon, Dyson and Murphy [1985] have tried to show, with the available evidence from literature, that increasing birth rate before the start of sustained decline has been the case for both historical Europe and contemporary developing countries. They have illustrated this phenomenon for India with data from Tamil Nadu and Bombay states. How both rural and biological factors respond to changing social economic and cultural environment (modernisation) has been thoroughly reviewed by Nag [1980] and thereby he establishes the causal mechanism between modernisation and population decline in fertility.
- 29 For an excellent discussion on the role and mechanism through which education affects fertility see Caldwell [1980] also Jain [1981] and Jain and Nag [1986].
- 30 The 27th round (1972-73) National Sample Survey data for Maharashtra and Gujarat states, however, did not yield such a convincing relationship between poverty and fertility. Vyas [1980]. However, the fertility measure used here was children ever born, but in Gupta and Malakar's analysis it was general fertility rate.
- 31 In fact some of the weaker sections of the society are dwindling in their numbers and face the threat of extinction. A case in point is the tribals in Bihar where a recent epidemic mysteriously due to the government, apparently caused by malnutrition, lack of availability of clean drinking water, and lack of access to medical services, claimed many tribal lives in a short time. The social conditions that create and facilitate this dwindling can be gauged from the following summary: "The coarse grains that they grow constitute a fraction of the Pahalias' [the tribals] diet. Mostly they depend on

wild herbs and even grass. Meat of dead animals constitutes another staple food of the Pahalias and they are in constant search of dead animals as that provides them something to eat without having to pay for it" [Bharti, 1989, 1504].

- 32 This is more so when the existing health and family planning system is to the disadvantage of the poor. A recent case study of Bihar state—one of the most backward states in India—notes that the extension workers and other health functionaries were concentrating more on the better off people because poor people are 'less prone to change', and in the PHCs poor patients were accommodated on the floor of the verandah because "these illiterate people do not know how to use the bed and will spoil it in no time" [Khan and Rao, 1989].

- 33 A recent elaborate population projection by Srinivasan et al [1988] shows that the demographic goal of achieving the Net Reproduction Rate of 1 may be realised by the year 2021 even if the future age specific marital fertility remains the same as in 1986.

Population and Agricultural Growth

A Study in Inter-Regional Variations

N Krishnaji
P Satya Sekhar

The Indian experience of the two decades, 1961-81, offers some scope for analysis of the interrelationships between the components of population growth and the characteristics of agrarian change. A dramatic improvement has taken place during this period in technology and productivity in some parts of the country even as other regions have demonstrably stagnated. Did the prosperous regions experience higher rates of population growth, either through higher rates of natural increase or through immigration? What is the demographic picture of areas of stagnation and decline: Are they marked by high rates of mortality and out-migration? One can ask similar questions about the extent to which population pressure has led to land or labour intensification in areas experiencing drastic declines in land-man ratio. This paper is concerned with these questions.

WHILE analysing the inter-relationships between the components of population growth—fertility, mortality and migration—on the one hand, and the characteristics of agrarian change such as improvements in the productivity of land and the intensification of labour, on the other, we must remember two facts. First, adjustments in both directions—population levels adjusting to what the land can produce; agrarian prosperity or decay leading to higher or lower population levels; and population pressure leading to land or labour intensification and technological change—take place over long periods. Second, such adjustments tend to be spatially specific and restricted so that they can be seen clearly only in small regions.

However, the Indian experience of the two decades, 1961-81, offers some scope for analysis in this respect. A dramatic improvement has taken place during this period in technology and productivity in some parts of the country even as other regions have demonstrably stagnated. The specific questions that arise in this context are the following: Did the prosperous regions experience higher rates of population growth, either through higher rates of natural increase or through immigration, than did other regions? What are the demographic pictures of areas of stagnation and decline: Are they marked by high rates of mortality and outmigration? These questions are about the extent to which population has redistributed itself over space in response to the regionally-concentrated nature of agricultural growth during this period. One can ask similar questions about the extent to which population pressure has led to land or labour intensification in areas experiencing drastic declines in the land-man ratios.

This paper is concerned with such questions. The analysis is based on data at the district and State levels relating to population, areas cropped and those under irrigation, value of production, etc. The agricultural data are borrowed from G S Bhalla and D S Tyagi, *Patterns in Agricultural Development* (1989) and refer to annual averages of three triennia: 1962-65, 1970-73, and 1980-83.

The population figure for the first period refers to 1963 and is the interpolated value from the 1961 and 1971 censuses; those for the second and third periods refer respectively to the 1971 and 1981 census counts.

The analysis can provide some suggestive insights only; it cannot yield conclusive answers to the questions being raised here. One reason is that the components of population growth, births, deaths, and net migratory flows, cannot be easily estimated at the district level. A second is that even if some adjustment takes place over such a short period the lags in adjustment that must be present cannot be easily identified.

We do know that increases in productivity and production during this period were unevenly spread over space. Thus a good starting point is the magnitude of inter-regional disparities; the changing pattern of disparities over time may then be expected to be of some analytical value. Section I looks at inter-State inequalities in per capita production, productivity per hectare, and land-man ratio; it goes on to discuss what can be described as the Malthusian type of adjustment: the question asked here is whether high rates of growth in production or productivity have induced high rates of population growth at the State level. The

TABLE 1: INTER-STATE VARIATIONS: STANDARD DEVIATIONS OF NATURAL LOGARITHMS OF VARIABLES

| Variable | 1962-65 | 1970-73 | 1980-83 |
|-----------------------------------|---------|---------|---------|
| Value of output per capita (V/P) | 0.2566 | 0.3379 | 0.4278 |
| Value of output per hectare (V/A) | 0.4187 | 0.4438 | 0.4201 |
| Land-man ratio (A/P) | 0.4525 | 0.4329 | 0.4632 |
| Value per worker (V/W) | 0.4101 | 0.4496 | 0.5089 |
| Work participation rate (W/P) | 0.2718 | 0.2023 | 0.2610 |
| Labour intensity (W/A) | 0.3680 | 0.3825 | 0.4105 |

Note: For basic data and sources see Appendix. The value figures (V) are in constant 1969-70 prices.

TABLE 2: DECOMPOSITION OF VARIATION IN LOG (V/P)

| Year | Var(v/p) | Var(v/a) | Var(a/p) | 2Cov(v/a, a/p) | r(v/a, a/p) |
|---|----------|----------|----------|----------------|-------------|
| 1963 | 0.0658 | 0.1753 | 0.2048 | -0.3148 | 0.82 |
| 1971 | 0.1142 | 0.1970 | 0.1874 | 0.2702 | -0.70 |
| 1981 | 0.1830 | 0.1765 | 0.2146 | -0.2081 | 0.28 |
| Distribution of change (per cent) 1962-63 | 100.0 | 1.0 | 8.4 | 90.6 | |

Note: In lower case letters v/p, for example, stands for ln (V/P), etc.

TABLE 3: ALTERNATIVE DECOMPOSITION OF VAR (ln V/P)

next part of this section is devoted to the evidence on the Boserupian kind of responses, e.g. land and/or labour intensification taking place in States experiencing severe population pressure or stagnation in productivity. Section II covers the same ground as Section I with districts as regional units and, naturally, is more informative about the adjustment process. The final section has some concluding remarks.

I Inter-State Disparities

METHOD

Writing V, A, P, and W respectively for value of production, gross cropped area, rural population, and workers in agriculture (cultivators plus labourers, male and female—all in specified units) at a point of time we set out the following identities:

$V/P = (V/A) (A/P)$ (1)
i.e., per capita output is the product of output per unit of land and land-man ratio, and

$V/P = (V/W) (W/P)$ (2)
that gives an alternative decomposition of V/P as the product of value per worker and work participation rate. Similarly

$V/P = (V/W) (W/A)$ (3)
and $A/P = (A/W) (W/P)$ (4)

These identities enable us to decompose the total variance across regions of a given variable into those of its components. For example, from (1) it follows that

$$\text{Var}(\ln V/P) = \text{Var}(\ln V/A) + \text{Var}(\ln A/P) + 2\text{Cov}(\ln V/A, \ln A/P) \quad (5)$$

MAGNITUDE AND CHANGE

Let us begin by looking at the variations at the State level. We do know that agricultural growth was unevenly spread during this period. To assess its net impact, the trends in inter-State variation in respect of the six ratios introduced above are presented in Table 1.

Of the six ratios we are considering in respect of three—per capita value of output (V/P), value per worker (V/W) and labour intensity (W/A)—a sharp increase has taken place in the disparities between the States during the two decades (1962-83), the widening of disparities was more marked in V/P than in V/W. It can be seen from Table 1 that the inter-State variations in the three other ratios, viz., yield per hectare (V/A), land-man ratio (A/P), and work participation rate (W/P) have remained fairly stable.

The widening in disparities is illustrated simply by the contrast between the performance of Bihar and that of Punjab. In constant

(1970-71) prices, the per capita output in these two States during 1962-65 was respectively Rs 192 and Rs 487; by 1980-83 this range was widened from Rs 153 in Bihar to Rs 1,134 in Punjab. Likewise, while the value per worker has stagnated at about Rs 585 in Bihar, it increased in Punjab from Rs 2,200 in 1962-65 to Rs 5,063 in 1980-83.

To understand these trends we use the two types of decomposition of V/P given in equations (1) and (2). The results are set out in Tables 2 and 3.

Table 2 shows that the increase in the inter-State disparities in per capita production has been brought about almost wholly (accounting for about 91 per cent of the total) by a weakening of the inverse correlation between productivity per unit of land and the land-man ratio. This inverse correlation, a macro-variant of the much-discussed size-productivity relationship, is of a compensatory nature, with low (high) land-man ratios generally associated with high (low) productivities, so that when it weakens (as

it has, from -0.82 to -0.28 , practically disappearing) per capita output variations widen. We shall discuss this phenomenon in detail later, but note here that the correlation itself is the result of a long-term adjustment process through which fertile lands tend to attract high population densities.

The alternative decomposition given in Table 3 shows that both an increase in the variation in the value per worker (77 per cent) and a decline in the inverse correlation between value per worker and the work participation rate (27 per cent) have contributed significantly to the inflation in the variance of per capita production. More on this later.

Two further decompositions of variances, respectively those of productivity per hectare and of the land-man ratio, are given in Table 4. (Let us recall that these variations have remained more or less stable (Table 2). We see from the statistics in Table 4 some interesting changes that lie behind the apparent stability in regional variations in the just-mentioned variables.

The first part of Table 4 shows that while disparities have widened in both V/W and W/A, the inverse relationship between these two variables has considerably strengthened and has contributed to the stability in productivity variations. The second half of the table shows that across the States, area per

worker and work participation rate have remained uncorrelated.

These changes in inter-regional inequalities can alternatively be described in terms of differential patterns of growth over time in the variables under study. We shall, for this purpose, restrict ourselves to the decade 1971-81 for two reasons: first, significant improvements in productivity and production started taking place only towards the end of the sixties, and their impact, if any, is likely to be clearly observable only during the seventies, and second, we are better served in respect of the relevant and comparable data for this decade than for the sixties.

Let us, to begin with, look at rates of population growth, the net result of births, deaths and migration. These rates, for the rural part of the different States, are directly derived from the census counts. Estimates of crude birth and death rates (CBR and CDR, respectively) are available from the data collected under the Sample Registration System (SRS), these refer to annual averages corresponding to triennia such as 1971-73, 1972-74 and so on (and are thus based on a shifting, increasing population base). We can, however, compute the average annual rate of natural increase (i.e. the excess of the CBR over the CDR) from these data. The excess of the annual compound rate of the observed population growth over the estimated annual average rate of natural increase provides us with an estimate—a crude one that can perhaps be refined by better methods—of the annual average of the rate of net migration, i.e. number of immigrants minus the number of out-migrants as a ratio of the population in a given year. These statistics are given in Table 5.

The rates of population growth in rural areas (during 1971-81) ranged from 1.25 in Tamil Nadu to 2.48 in Rajasthan and the average rate of natural increase ranged from 1.59 in Tamil Nadu to 2.58 in Haryana. The estimated annual average net migration rate generally tended to be negative, indicating, an excess of out migration over in-migration—arising, no doubt, from rural to urban flows being the most prominent among population transfers. The exceptions to this are in respect of Assam and Rajasthan—experiencing significant net inflows into rural areas—and, to a much less extent, Himachal Pradesh, Bihar and Karnataka. The net migration rates are generally low; the highest rate corresponds to Uttar Pradesh with an annual net out-migration

TABLE 9. VARIATION BETWEEN (B) AND WITHIN (W) STATES—MEAN SQUARES

| Variable | Source of Variation | 1962-65 | 1970-73 | 1980-83 |
|----------|---------------------|---------|---------|---------|
| V/P | B | 0.86 | 1.79 | 2.85 |
| | W | 0.06 | 0.08 | 0.11 |
| V/A | B | 1.25 | 4.17 | 4.80 |
| | W | 0.09 | 0.10 | 0.12 |
| A/P | B | 3.47 | 3.49 | 3.84 |
| | W | 0.12 | 0.13 | 0.13 |
| V/MW | B | 1.55 | 2.40 | 3.14 |
| | W | 0.06 | 0.07 | 0.12 |
| MW/P | B | 0.46 | 0.31 | 0.51 |
| | W | 0.02 | 0.02 | 0.06 |
| MW/A | B | 2.56 | 2.93 | 3.33 |
| | W | 0.10 | 0.10 | 0.14 |

B Between States (13), W Within States (255)

Note: For each variable the inter-district variation is broken up into the between state and within state components. The degrees of freedom are 13 and 255 respectively corresponding to a total of 269 districts in 14 states.

rate of 0.87 per cent of the total population. Similar, relatively high net out-migration rates are observed in the cases of Haryana, Punjab, Kerala, Orissa and Tamil Nadu. This suggests that out migration is induced not only by conditions of stagnation in agriculture but also by those of prosperity. (More on this, as well as on the implications of low migration rates to the changes in land-man ratio, later.)

To see whether these variations in population parameters are related to the structure and change in agriculture, simple correlations between these parameters and the levels and changes in such variables as per capita production and yield per hectare are computed (Table 6). Most of those correlations are weak but a few are significant. Let us note these:

- rates of natural increase during 1971-81 are positively associated with both changes in per capita production during 1963-71 (and hence during 1963-81) and changes in productivity per hectare. This is a restatement of the fact that States such as Punjab, Haryana, Uttar Pradesh and Jammu and Kashmir experienced impressive agricultural growth along with relatively higher rates of natural increase in contrast to States such as Bihar, Orissa and Tamil Nadu characterised by poor agricultural performance and low rates of natural increase.
- The decline in the birth rate during 1971-81 is positively associated with the levels of per capita production in both 1963 and 1971, while the decline in the death rates is positively correlated only with the increase in per capita production. It may be noted that the decline in death rates has been far lower in Bihar, Madhya Pradesh and West Bengal—States that have experienced drastic falls in per capita production.

TABLE 7. CORRELATES OF CHANGES IN LAND PRODUCTIVITY AND LABOUR INTENSITY, 1971-81 (Simple Correlation Coefficients)

| | Changes during 1971-81 in | |
|--------------------------------|---------------------------|------------------------|
| | V/A (Land Productivity) | W/A (Labour Intensity) |
| Land-man ratio A/P 1963 | 0.38 | 0.14 |
| Land-man ratio 1971 | 0.33 | 0.09 |
| Changes in A/P 1963-71 | 0.33 | 0.27 |
| Changes in 1971-81 | 0.29 | 0.66* |
| Per capita production V/P 1963 | 0.30 | 0.00 |
| Per capita production V/P 1971 | 0.19 | 0.13 |
| Changes in V/P 1963-71 | 0.08 | 0.21 |
| Changes in V/P 1971-81 | 0.91* | 0.25 |

Note: * denotes significance at 5 per cent level.

TABLE 8. INTER-DISTRICT VARIATIONS: STANDARD DEVIATION OF NATURAL LOGARITHMS

| Variable | 1962-65 | 1970-73 | 1980-83 |
|-----------------------------------|---------|---------|---------|
| Per capita output (V/P) | 0.319 | 0.409 | 0.492 |
| Output per hectare (V/A) | 0.492 | 0.549 | 0.586 |
| Land-man ratio (A/P) | 0.534 | 0.538 | 0.555 |
| Value per male worker (V/MW) | 0.357 | 0.131 | 0.517 |
| Male workers in population (MW/P) | 0.201 | 0.175 | 0.279 |
| Male labour intensity (MW/A) | 0.469 | 0.486 | 0.539 |

Note: Note that labour intensity, etc., are measured with respect to male workers only.

- (c) Net out-migration rates are positively correlated to the level of per capita production in 1971, a reflection of the fact that good performers in agriculture during the late sixties such as Punjab and Haryana have recorded relatively higher rates of net out migration

On the whole, despite the inconclusiveness of these findings, they suggest that agrarian prosperity has promoted higher rates of natural increase through more significant declines in death rates. They also suggest that prosperity-induced rural urban migration might have been an important factor in rural population change during 1971-81

Let us now see to what extent changes during 1971-81 in the land man ratio (which has declined everywhere except in Punjab) or in per capita production—the two variables standing as proxies for population pressure—have induced changes in productivity of land, labour intensity and work participation rates. The correlations given in Table 7 show that

- (a) changes in productivity per hectare were positively correlated with changes in per capita production but uncorrelated with levels and changes in land man ratios and
- (b) changes in labour intensity, i.e., workers per hectare, are inversely related to changes in land-man ratios (A/P) (States experiencing drastic declines in gross cropped area per person such as Bihar, Tamil Nadu, Gujarat, Karnataka, Andhra Pradesh and West Bengal have recorded impressive increases in the number of workers per hectare)

These changes suggest a weak form of Boserupian adjustment of labour intensity to a declining land man ratio: it is weak because the results are seen in terms of improvements in productivity only to the extent that inter regional variations have not widened as perceptibly as in the case of per capita production

II Inter-District Disparities

In this section we present disparities with districts as regional units. Of the districts covered by the Bhalla-Tyagi study, only 269 are retained here because we do not have data on all the variables for the remaining districts. For the same reason the coverage in terms of the States also is different from that of the last section, Assam, Jammu and Kashmir and Himachal Pradesh not being included here

CHANGES

Let us first look at the magnitude and change in inter district variations with respect to the six ratios discussed in the previous section. The relevant measures (standard deviation of natural logarithms) are given in Table 8. Comparing the statistics here with those in Table 1, we see that, as in the case of States as units, in terms of districts also, disparities have widened considerably in per capita production, value per worker, and labour intensity (note, however, that here we are considering output per male worker). Similarly, in both cases, inter regional variations in the land man ratio tended to be fairly stable. In respect of the remaining two ratios, the inter State and inter district data exhibit different patterns while inter State variations in productivity per hectare and the work participation rate have tended to be minimal, inter district variations in these two variables have widened considerably. No doubt, a part of the explanation lies in the lack of perfect correspondence between the two sets of data (in terms of coverage and the definition of workers—male and female in the State level data but only male in the district level data). Also, in the district wise analysis, the State average (of, say, per capita production) is the average of district averages which differs from the average computed directly for the whole State.

But a more important reason for the differential pattern is that the course of disparities between districts depends not only on what happens at the State level but also on what happens within States. A standard decomposition of the total inter-district variance into components between States (B) and between districts within States (W) is given in Table 9

It will be seen that disparities between districts within States have considerably

TABLE 12 GROWTH IN AREA AND POPULATION—DISTRICTS CLASSIFIED BY LEVELS AND CHANGES IN LAND MAN RATIO AND IRRIGATION RATIO

| Increase in Irrigation Ratio 1963-81 (Per Cent) | Decline in Land Man Ratio (Per Cent) 1963-81 | | |
|--|---|---------|-----------|
| | Above 25 | 10-25 | Below 10 |

the land-man ratio, especially during the seventies. This happens because of the well-documented fact that within each State, with

the possible exception of Punjab and Haryana, rapid and impressive growth and the attendant changes have been confined to a few well-endowed districts. For a fuller understanding of the widening inter-district inequalities, it would therefore be necessary to study variations within each State. We do not attempt this here. Instead we proceed with decompositions of the type made in the last section.

Table 10 gives two decompositions of the variance in $\ln(V/P)$. Since we have already made comparisons between inter-State and inter-district variances let us look at the co-variance terms. As in the case of State-level data, the inverse correlations between land-man ratio and productivity per hectare, and between value per worker and work participation rate, across the districts have declined. But this attenuation can be seen to be much less severe. For example, the first of the above correlations has decreased from -0.82 to -0.79 , contributing 11 per cent to the inflation in $\text{var}(\ln V/P)$ (whereas, between States, as we saw before, the corresponding contribution was as high as 91 per cent—Table 2). Likewise, the contributions of variances of v/w , w/p and the co-variance between them are also radically different across States and across districts. This kind of a differential pattern clearly suggests that while these inverse correlations have practically disappeared in terms of States as a whole, they continue to hold (at whatever level) within each State across the districts. Two further decompositions, respectively of variances in v/a and a/p are not very informative (Table 11).

RESPONSES

Let us now see what these trends in inter-district disparities imply to the manner in which either population or land use variables have responded to declining land-man ratios. Since land-man ratios are measured in terms of surface area (gross cropped area per rural person) of varying fertility, a further classi-

fication by levels of irrigation intensity (gross irrigated area as a ratio of gross cropped area) provides some means of identifying patterns in change.

First, we look at the expansion in gross cropped area and population. Table 12 gives the average rates of increase in area and population of districts classified according to changes in the land-man ratio and the irrigation ratio.

Districts experiencing minimal declines in A/P have the highest rate of expansion in area. Of course, there is a circularity in this finding. To see how the initial levels of A/P and irrigation ratio have influenced rates of expansion in area, the data according to the relevant classification are presented in the bottom third panel of Table 12. It can be seen that area expansion has been most impressive in districts with an irrigation ratio in 1963 in excess of 50 per cent, and especially those where the land-man ratios have also been relatively high in 1963. Districts with low base (1963) levels of irrigation ratio and land-man ratio have a poor record of expansion in area. Turning now to population growth, we notice, as expected, population increases being positively associated with declines in land-man ratio (causation possibly running both ways). Despite their poor inferential value, these data are given here to show that most districts in Punjab (except Gurdaspur) appear at the bottom right hand corner of this panel (with decline in A/P less than 10 per cent and increase in irrigation ratio above 30 per cent) and on the average record a somewhat low population growth during 1963-81 of 34.8 per cent. Since the rate of natural increase in this State was relatively high (following an impressive decline in death rates), the low rate of population growth may well be the result of prosperity-induced rural to urban migration. This inference is of course no more than a guess.

Table 13 gives the average increase in productivity per hectare (V/A) in districts classified according to levels and changes in A/P and the irrigation ratio. We see that

TABLE 13: CHANGES IN PRODUCTIVITY PER HECTARE, 1963-81—DISTRICT AVERAGES

| Irrigation Ratio 1963 Per Cent) | Land-Man Ratio (A/P) 1963 (ha) | | |

Note: P stands for rural population. Definitions of other variables are in the notes to Tables A2 and A3.

productivity expansion is positively associated with base (1963) levels of the two classificatory variables. The most impressive growth has taken place, moreover, in areas experiencing high rates of expansion in irrigation and low rates of decline in land-man ratio. In particular, there is no evidence of an adjustment in terms of improvements in productivity as a response to drastic falls in the land-man ratio.

Finally, in Table 14 we present changes in labour intensity (number of male workers per hectare). The first half of this table shows that, during the base period, levels of labour intensity are, as expected, positively associated with productivity and inversely with the land-man ratio. The second half of the table gives the rates of change in the labour intensity during 1971-81. These tend to be negative in areas experiencing minimal falls in the land-man ratios, which have earlier been identified as districts with impressive records of growth in productivity. On the other hand, districts experiencing severe declines in land-man ratio record a

significant increase in labour intensity. This is a weak type of Boserupian response, referred to earlier.

III Concluding Remarks

The agricultural growth strategy employed in India, of concentrating effort and investment of resources in well-endowed, irrigated regions of the country has, of course, paid rich dividends in terms of increases in agricultural production, especially of food, at the national level. But the price that has been paid is all too obvious: inter-regional inequalities have worsened and have been leading to political tension.

The effects of growing inequalities in food production are mitigated to some extent through the public distribution system. However, the lack of improvements in productivity and of expansion in employment, in agriculture as well as in related sectors, leaves the rural poor in the neglected regions

untouched by the visible national growth.

Population movements tend to be negligible in relation to the total numbers at the district and State levels. The course of population growth has been dictated above all by a continuously declining mortality rate. The consequences of the resulting, nearly universal, decline in the land-man ratio are serious for those at the bottom end of the landholding scale. Labour intensification has to be understood thus in the context of a spatially uneven growth process and of restricted possibilities for migration for work.

An interpretation of this may be possible in terms of the models of Malthus and Boserup. However, both these are 'closed' ones in spirit and, therefore, only when the roles of the state, and of population movements are brought explicitly into the analysis, would they be useful. In particular, while the processes of adjustment between population levels and resources are undoubtedly real, they can only be described in specific historical contexts.

HYV Technology: The Polarisation and Immiserisation Controversy

G Parthasarathy

The interaction between technology and institutions is complex and it is not easy to disentangle the social impact of technology without reference to the social institutions through which it generates its impact. Nor is it very rewarding to try to abstract the effects of technology per se. This paper does not pretend to establish the causal relationship between technology per se and social change. Instead, it follows a 'before and after' and 'with and without' approach to illuminate the nature of change associated with technology.

Section I of the paper deals with technology and trends in polarisation and proletarianisation and Section II with differences in trends in polarisation and proletarianisation between technologically leading and technologically lagging States. Section III discusses wages, unemployment and immiserisation in technologically leading and lagging States, Section IV examines inequality, non agricultural employment and sustainability of capitalist farming in technologically leading States and Section V deals with class formation in technologically leading and lagging States.

INTRODUCTION

WRITINGS during the early phase of green revolution [Parthasarathy, 1970, Frankel, 1971, Byres, 1972, Dasgupta, 1977] predicted transformation of the direct producers into proletariat, demise of share croppers, polarisation of rural society into kulaks and proletariat and immiserisation. Some of these also predicted that red revolution would follow green revolution.

During the same early phase there were not only different but opposite perceptions [Schultz, 1964, Mellor, 1973, Ruttan, 1977]. As per these perceptions, the new technology in agriculture contributed to the growth of a class of enterprising owner cultivators in the place of rentiers, increased the viability of the small cultivator, contributed to growth and poverty alleviation through its favourable effects on employment and real wages. The causal relationship between new technology on one hand and proletarianisation and immiserisation on the other is denied because new technology is considered scale neutral and the technical complementarity between modern varieties and labour displacing machineries is questioned. In these perceptions, the real danger of polarisation is not because of new technology but because of insufficient progress in technology. In the absence of technological progress, it is argued, high demographic pressures push down employment and wage levels, raise land rents, strengthen feudal dominance and intensify the social conflicts between land owners and landless. Even effective implementation of land reforms cannot be expected [Hayami, 1981, Hayami and Kikuchi, 1985].

Quite a few studies in the past sought to throw light on these conflicting propositions [Hanumantha Rao, 1975, Jhli, 1975, Rajaraman, 1975, Bhalla and Chadha, 1982]. But in all these studies the data used pertain mainly to the early phase of the green revolution. This paper presses into service a wide range of secondary data on trends in the 70s and early 80s on land-

lessness, employment, real wages, and inequalities to throw light on the nature of social impact associated with HYV technology.

It is relevant to note that the social impact that we observe is the compound influence of interaction between institutions including markets, technology, and demography. All these are affected by the policy interventions of the State. In fact, the HYV technology which became pervasive since the late 60s was preceded by land reforms which had the effect of weakening the feudal base of agriculture. Policy interventions of the state also contributed to the emergence and growth of a whole set of institutions which integrated the rural markets with the wider markets. The growth of credit institutions, co-operatives, commercial banks and regional rural banks contributed to the integration of rural money markets with the wider markets. Similarly new political institutions created channels of integration of local power with State power and created effective pressures for the extension of social and economic infrastructure to rural areas. These helped to link up local product markets with the regional and national markets and prepared the ground for the emergence of an entrepreneurial class in the place of rentier class, with varying levels of successes in different regions of the country. Further, favourable terms of trade for a decade and a half preceded the HYV technology. Policy interventions not only provided the institutional climate for the spread of the new technology but also were directed towards moderating the possible adverse impact. Further, the HYV technology should be seen as an extension of commercialisation of the markets, which has been achieved even within the frame of traditional agriculture, to input markets, though it has meant a qualitative change in terms of its stronger impact on the multi stranded personalised relationships within a rural community.

The interactions between technology and institutions is complex. It is not easy to

disentangle the social impact of technology without reference to the social institutions through which it generates the impact. Nor, is it considered highly rewarding to abstract the effects of technology per se. This paper does not pretend to establish the causal relationship between technology per se and social change. Instead, it follows (a) before and after approach, and (b) with or without approach to illuminate the nature of change associated with technology. In the before and after approach, the change observed in a variable relevant to polarisation and immiserisation in the 70s, a period of rapid spread of the technology, is compared with the 60s, a period marked by the beginning of the 'green revolution'. The limitations of two time point data are recognised in interpreting the trends. For the 'with or without approach' the data for technologically leading States are contrasted with the technologically most lagging States. Wherever possible, both the approaches, viz, before and after and with or without approaches are combined.

Section I of the paper deals with technology and trends in polarisation and proletarianisation, Section II with differences in trends in polarisation and proletarianisation between technologically leading and technologically lagging States, Section III with wages, unemployment and immiserisation in technologically leading and lagging States, Section IV with inequality, non-agricultural employment and sustainability of capitalist farming in technologically leading States, and Section V with class formation in technologically leading and lagging states.

I

Technology and Trends in Polarisation and Proletarianisation

Polarisation of rural society into kulaks and proletarians is the culmination of a long historical processes, viz, growing class differentiation, increased landlessness, transformation of direct producers into a class of

labourers, casualisation, and concentration of land and other means of production in the hands of a few capitalist farmers. Even in the United Kingdom, the classic case of capitalist farming, the process was long and tortuous [Parthasarathy and Pothana, 1984]. In France, the stubborn persistence of the small peasant economy despite capitalism's onslaught after the French revolution, is an eloquent testimony to the dangers involved in dogmatically asserting a form of organic transition in which the peasantry is quickly swept away. Further the transition to agrarian capitalism has taken different forms which implied only a slow process of polarisation in rural society. In Latin America, transnational capital and modern technology have penetrated agriculture through 'contract farming road', and without appropriation of the land of the peasant producers. In Japan, Korea and Taiwan capital and technology have penetrated agriculture with small owner-cultivating peasantry as small farms had been put under the direct control of State monopoly capitalism so that there could be no capitalist development in agriculture [Byres, 1986]. In the Indian context, we should expect polarisation to be a slow process within agriculture. Firstly, the continuing imperfections in the land market do not facilitate concentration and consolidation of land within capitalist farms. The absence of opportunities in non-agricultural employment for dispossessed peasants forces them to hold on to their tiny bits of land and survive by 'self-exploitation'. Thirdly, the low level of industrialisation retards progress of capitalist farming. It is against this background that we consider the critical elements in trends associated with polarisation.

LANDLESSNESS AND NEAR LANDLESSNESS BY OWNERSHIP

The distribution of owned holdings, at the all-India level, for four points of time, viz, 1953-54, NSS 8th Round; 1961-62; NSS 17th Round, 1971-72; NSS 26th Round, and 1982; NSS 37th Round is examined with focus on changes in the position between 1971-72 and 1982 with the corresponding changes in the position between 1961-62 and 1971-72, ignoring 1953-54. Sawant [1990, p 136] notes that 'from 16th Round onwards the distribution of household ownership holdings remained comparable between the rounds', and household ownership distribution given by the 8th Round is not comparable with that derived from any of the successive rounds.

The totally landless (those owning either no land or with land less than 0.002 hectares) showed a decline from 11.68 per cent of the rural households to 9.64 per cent in 1971-72. This decline was reversed, with a rise from 9.64 to 11.33 per cent in 1982, suggesting the association of advance in technology with growing landlessness. We use an alternative measure, i.e., the near landless which includes also households with less than 0.41 hectares. By this measure, the percentage of near

landless which formed 44.21 per cent rose slightly to 44.87 per cent in 1971-72. The rate of rise was much higher in the decade 1970s with increase to 48.21 per cent again suggesting the association of advances in technology with growing landlessness.

We use three alternative measures to judge the changes in the pattern of distribution, (1) Gini coefficients of concentration; (2) share of land held by the category of large owners; i.e., holding more than 10 hectares and (3) share of area of bottom 60 per cent of rural households as compared to the share of top 10 per cent in the area.

The Gini coefficients of concentration of ownership declined from 0.73 in 1961-62 to 0.71 in 1971-72 and remained constant at 0.71 in 1982 [Sarvekshana, October, 1987, p 9]. The inference is that the period associated with advances in technology is marked by reversal of trends of decline in concentration.

The share of large owners, defined as those owning more than 10 hectares, showed a continuous decline both in terms of numbers and area. Three major factors have been at work in bringing about this result; ceiling laws, transformation of the feudal holdings into smaller capitalist farms with higher degree of capital intensification; and demographic pressures. All these three factors set a limit to consolidation and concentration of land in large sized kulak farms. Further, land, as a measure of the share of large farms, is inadequate in the context of growing capital intensification of farms. However, by this measure, recorded data at the all-India level does not suggest that advances in technology are associated with growing centralisation and consolidation of land in large farms. Instead the shift from feudal to capitalist farms has been taking place simultaneously with a reduction in the share of large farms, defined in terms of physical extent of land.

A better measure, in the context of growing demographic pressures resulting in a decline in the size of land of all groups of farmers including the large, is to judge the share of area of decile groups of households over time. The results based on NSS Rounds (with required interpolations) are presented in Table 1.

TABLE 1: DISTRIBUTION OF OWNERSHIP BY FRACTILE GROUPS

| Year | Bottom 60 Per Cent of Rural Households | Middle 30 Per Cent of Rural Households | Top 10 Per Cent of Households |
|---------|--|--|-------------------------------|
| 1961-62 | 5.95 | 48.28 | 45.79 |
| 1971-72 | 8.62 | 45.25 | 46.13 |
| 1982 | 8.81 | 44.86 | 46.33 |

Source: Relevant NSS Rounds.

TABLE 2: DISTRIBUTION OF OPERATION BY FRACTILE GROUPS

| Year | Bottom 60 Per Cent of Operational Holdings | Middle 30 Per Cent | Top 10 Per Cent |
|---------|--|--------------------|-----------------|
| 1961-62 | 18.75 | 39.42 | 41.83 |
| 1970-72 | 18.63 | 42.19 | 39.18 |
| 1982 | 13.85 | 39.80 | 46.35 |

Source: Relevant NSS Rounds.

These show that the share of the top 10 per cent of the top ownership group of households has shown hardly any decline over the period despite the observed reduction in the share of holdings above the ceiling level. These data corroborate the inference drawn from Gini coefficients. There is also an indication of a sharper differentiation among the peasantry, since capital intensification on the top 10 per cent of the holdings has proceeded at a faster pace than on the bottom group of ownership of holdings.

OPERATIONAL HOLDINGS AND CONCENTRATION

The Gini coefficients of concentration of operational holdings were 0.58 for 1960-61, 0.59 for 1971-72, and 0.63 for 1982. These show a continuous rise. The rise is much more perceptible during the period of the second phase of green revolution. But the observed steep rise in the Gini coefficient could partly be due to the inclusion of operational holdings of squatters in the 37th Round and their exclusion in preceding rounds [Sawant, 1990, p 40].

The share of households with large operational holdings, as in the case of large ownership holdings, shows a steady decline both in terms of numbers and area. The changes in the distribution of operational holdings do not suggest any trends towards growing concentration with large holdings when largeness is measured only by the extent of land. Capital intensification has grown with reduced share of the large farms in the total number and their area.

A more meaningful profile of the distribution of operational holdings and concentration could be got from the shares in area for the decile groups (Table 2).

This shows that the second phase of green revolution has been marked by a rising share in the operated area of the top 10 per cent of the holdings and a steep fall in percentage share of the bottom 60 per cent. This may be compared with ownership distribution shown earlier. Growth in concentration of area in the top 10 per cent is much more in the operated area than in the owned area. Changes in the lease market provide an ex-

planation for this difference in the levels of concentration between ownership on one hand and operation on the other

A comparison of the percentage of leased-in to operated area for 1960-61, 1971-72 and 1982 reveals that agricultural tenancy for the entire country remained stable in the 1960s at around 10.5 per cent of operated area as the lease market shrank in seven States and expanded in six States. But the aggregate tenancy significantly declined during the 1970s when the lease market shrank in all the States and to 7.27 per cent in 1982 [Swamy, 1988, p 557]. This suggests that the period associated with advances in technology was marked by decline in tenancy as compared to the early phase of green revolution. Corresponding to the decline in the percentage leased in to operated area, the tenant households as a percentage of the cultivating households declined from around one-fourth of the total to 17.78 per cent. While the leased in area of the marginal farmers continued to be in excess of the leased out area, the net leased in area as a percentage of the operated area showed a considerable decline [Swamy, 1988, p 561]. The second phase of the green revolution is marked by decreased access to land through the lease market for the small farmer. The changes in the lease market associated with green revolution have contributed to the growing proletariat class [Bhutes, 1981].

PROLETARIANISATION AND CASUALISATION

The concept proletarianisation has a distinct meaning in Marxian literature [Parthasarathy, 1978]. Firstly it implies growth in hired labour which is dispossessed of the means of production. This is a necessary but not a sufficient condition. Such labour must be free to sell labour power in the sense it is not tied to a particular employer by bondage of customary cropping and traditional attachments of patron-client relationships. Creation of 'surplus value' used for further accumulation is another condition to characterise a hired labourer as a proletariat. A further condition is class consciousness. A proletariat transcends the barriers of caste, kinship and religion. Proletarianisation is the counterpart of capitalist farming. Given the slow and uneven process of development of capitalism within agriculture, even while capitalism is penetrating into agriculture it may not manifest itself in proletarianisation in the classic sense. Rastvannikov [1981], a Soviet scholar characterised the situation which does not satisfy the classic connotation, except the first condition, as 'proto-proletariat'. It is in this sense we use the concept here. Though landlessness should not be identified with proletarianisation, it is a critical determinant of it in densely populated agrarian economies.

There has been an acceleration of the percentage of near landless in the 70s as compared to the 60s. Such an acceleration has also been noted in the case of agricultural labour households. The wage

employed as a percentage of total workers as in 1983 was close to around 40 per cent. The growth in the rural proletariat has been marked by a faster rate of casualisation of workers.

In brief, at the aggregate all-India level, the second phase of green revolution was marked by faster pace of proletarianisation and casualisation of labour in rural society even in the absence of increased consolidation and concentration of land in the large farms.

II

Polarisation and Proletarianisation in Technologically Leading and Lagging States

The preceding approach, while it distinguishes the second phase of the HYV technology from the first phase, does not separate the effects of technology from other effects. We seek to throw light on this by contrasting the trends in the technological leading States with the technologically lagging States ignoring the States at the intermediate level. The technologically leading States are Punjab and Haryana and the technologically lagging States considered are Bihar, Orissa and Madhya Pradesh.

Two measures are used to judge the trends in marginalisation: landless by ownership, and near landless by ownership, i.e. by including those who owned less than 0.41 hectares among the landless. By ownership criterion the second phase of green revolution is marked by reduced landlessness in the technologically leading States. Technologically lagging States show a mixed picture. Bihar shows reduced landlessness by ownership criterion but increased near landless by ownership criterion. Madhya Pradesh shows growing landlessness by both

the criteria. In Orissa there is a mixed picture. We judge that technology *per se* has not contributed to growing landlessness by ownership criterion.

As regards trend in concentration between the two groups of States, in the technologically leading States, Gini coefficients of ownership show a fall during the 70s. In the technologically lagging States, both Bihar and Orissa show a reduced concentration while Madhya Pradesh shows a rise.

Gini coefficients of operational holdings show a rise both in technologically leading as well as technologically lagging States. It however needs to be pointed out that technologically leading States show a sharper rise in the concentration of operational holdings [Haque, 1987], as medium and large owners increase their share of leased in area and also resume land for self-cultivation.

TECHNOLOGY AND TENANCY

The second phase of technology is associated with a rapid decline in the percentage area under tenancy. Such decline is not however restricted to the technologically leading States. But as compared to 1960 in the technologically leading States rate of decline in tenancy has been faster. In the percentage of leased in area continues to be far higher in the technologically leading States (see Table 4).

With the emergence of the middle owner as tenant in the lease market the small owner who was formerly leasing in has less opportunities to improve his possession of land and drifts into the ranks of agricultural labour. Reduced access of land to the small owner though leasing in has been contributing to the growth of proto-proletariat both in technologically lagging and leading States.

TABLE 3 GROWTH OF PROLETARIANISATION BY ALTERNATE MEASURES (Percentage)

| | Early Sixties 1 | Early Seventies 2 | Early Eighties 3 |
|--|------------------------|------------------------|---------------------|
| 1 Landless and near landless by ownership | 41.31 | 44.87 | 48.21 |
| 2 Near landless by operational holdings | 1.14 | 21.25 | 31.03 |
| 3 Agricultural labour households in total rural households | 24.50 (for 1956-57) | 35.30 (for 1974-75) | 30.70 (for 1983) |
| 4 Percentage of casual agricultural labourers in total rural workers | | | |
| Males | 18.10 | 19.50 | 23.50 |
| Female | 27.70 | 29.20 | 31.40 |
| 5 Wage employed as percentage of all rural workers | | | |
| Males | | 34.10 | 39.60 |
| Females | | 35.50 | 37.80 |
| 6 Casual wage earners in wage employed | | | |
| Males | | 64.51 | 72.72 |
| Females | | 88.45 | 91.80 |

Rows 5 and 6: From Vaidyanathan, 1986
Near landless holdings below 0.41 hectares

In the technologically leading States, the changes in the lease market contributed to growing proletarianisation, while in the technologically lagging States demographic factors had a more significant influence. However, it needs to be noted that technological development, while it has contributed to the emergence of capitalist tenancy, has not reduced the importance of subsistence tenancy even in Punjab.

The trends towards increase in wage labour (males) in rural areas have been noted from the NSS data [Vaidyanathan, 1986]. The rise in the proportion of wage labour was noted in every State. The notable exceptions are Kerala, the State in which proportion of wage labour exceeded 50 per cent even in the 1970s, and Maharashtra where there was a decline as compared to the severe drought conditions of 1972-73. The data presented do not show that wage labour grew

at a faster rate in the technologically leading States as compared to technologically lagging States between 1972-73 and 1983 (see Tables 5 and 6). Part of the reason is that the technologically leading States depend heavily on migrant wage labour from other States and this is not reflected in the rural household data. If a faster pace of capitalist farming has contributed to the growth of wage labour in technologically leading States, demographic pressures and fast declining land man ratios have increased the proportions of wage labour in technologically lagging States.

The striking difference between the technologically leading and technologically lagging States relates to the levels of the percentage of casual workers in rural labour force [Minhas and Majumdar, 1987]. As in 1983, Punjab and Haryana show only around one-half of the percentages recorded for Bihar, Orissa and Madhya Pradesh. Further, in Punjab and Haryana the percentage of casual labour in total rural wage labour (males, current daily status) is around 45 as against 70 per cent or more in the technologically lagging States [Vaidyanathan, 1986]. This feature has relevance to the issue of class formation in agriculture, which we shall take up later. It may however be noted that the effects of HYV technology in relation to the share of casual labour in wage labour has not been uniform. In Andhra Pradesh tractors displaced permanent farm servants along with plough bullocks and contributed to a higher degree of casualisation, while in Punjab and Haryana mechanisation was associated with a growing share of permanent agricultural labour in the total agricultural labourers.

III Wages, Unemployment and Immiserisation: Technologically Leading and Lagging States

The immiserisation hypothesis is closely linked to the polarisation and proletarianisation hypothesis and the consequential adverse effects on employment and wages. We therefore review the evidence on the recent trends in real wages, employment and unemployment and absolute poverty.

TRENDS IN REAL WAGES

Analysis of State-wise trends in real wages [Jose, 1988] shows a rise for agricultural labour both for males and females particularly since middle 1970s. The rate of rise has been more for females than for males. It should however be recognised that the observed trends have been heavily influenced by successive good crops in the early 80s and their favourable effects on the consumer price index of agricultural labour.

Technologically leading States such as Haryana and Punjab do not show a rise in real wages. Real wages in these States were either slightly negative as in Punjab or stagnant as in Haryana. This should however be considered against the context of (a) rise during the early period of green revolution, (b) large flow of immigrant labour, and (c) introduction of labour displacing machinery. Looking at the entire period of 1961-84 it is clear that wage hikes of the early years of the green revolution could never be repeated in the 70s and 80s [Chadha, 1986, p. 267]. It should also be recognised that levels of money wages in Punjab and Haryana continue to be the highest and are nearly double the corresponding wage rates in the technologically lagging States.

In contrast to Punjab and Haryana, the technologically lagging States of Bihar, Orissa, Madhya Pradesh, pockets of low wages have been noted to show improvement in real wages since 1970s. However in these States, the observed rate of rise cannot be satisfactorily explained. The State-wise annual growth rates in the foodgrain production between 1971-85 fell behind the rate of growth of rural population in all these States. In Bihar and Orissa, the rates of growth of foodgrain production were 1.25 and 1.59 between 1971-85, less than the rate of growth of rural population. In Madhya Pradesh, the rate of growth moved from negative in the 60s to positive in the 70s but less than the rate of growth of rural population [Hanumantha Rao and others, 1989].² In the context of these developments pointing to excess of supply of labour over demand, it is difficult to explain the rise in the real wages in the technologically lagging States. There is no doubt that the high levels of real wages in the technologically leading States were maintained because of technology and the high growth rates of agricultural production sustained over long period.³

TABLE 4 LEASED IN OPERATED AREA
TECHNOLOGICALLY LEADING AND LAGGING
STATES

| State | Percentage of Leased in in Operated Area | | |
|---------------------------------------|---|---------|-------|

UNEMPLOYMENT

Incidence of unemployment, at the beginning of the 1970s, was generally high in the densely populated eastern States and also in the southern States and Maharashtra with high proportions of wage labour and casualisation. It was low in the high irrigated and technologically leading north-western States and also in the less densely populated Rajasthan and Madhya Pradesh. In the technologically developed States, use of land augmenting technology, rise in yields, shift to labour intensive crops, increased intensity of cropping, faster growth of allied occupations and off-farm employment have increased employment notwithstanding the lower elasticity of employment to output. Initially, labour displacing mechanisation did not result in reduced overall employment since it was associated with increased irrigation and increased intensity of cropping, and also of off-farm employment [Rakesh Basant, 1987, pp 1360-61].

The second phase of green revolution was found to be different in relation to employment and underemployment. Both in Punjab and Haryana, the incidence of unemployment rose both for males and females between 1972-73 and 1983 [Minhas and Mujumdar, 1987]. In Punjab, the incidence of unemployment rose from 5.04 per cent in 1972-73 to 6.43 per cent in 1983 for rural males. In Haryana it rose at a faster rate, i.e. from 3.91 per cent to 6.62 per cent.

Vaidyanathan noted, on the basis of NSS data for 1972-73 and 1977-78, that the rate of growth of employment in agriculture was

much slower than the rate of growth of output. His findings for the technologically leading and technologically lagging States are as in Table 7.

The results are to some extent vitiated by the marked differences in weather conditions between the two years. Yet the broad inferences relating to differences in employment elasticities between technologically leading States and technologically lagging States are valid. The advanced stage of technology is marked by a considerably lower elasticity of employment in agriculture with complementarity between biological and mechanical technology. Sheila Bhalla (1987) verifies the findings of Vaidyanathan with the help of cost of cultivation data for 1971-72 to 1983-85 and suggests further confirmation of reduced elasticity of employment in the advanced stage of green revolution. Her results are in Table 8.

Despite high rates of growth exceeding 3 per cent, trends in rate of growth of labour absorption are low, and rate of growth of labour absorption per hectare negative. Labour absorption in agriculture lagged behind the rate of growth of male workers in the technologically advanced States, as in technologically lagging States. Apart from complementarity between biological technology and mechanical technology (whether technical or not), the technologically leading States have also been showing a fast rate of growth of overall casualisation of rural labour force [Minhas and Mujumdar, 1987, Table A-3] as shown earlier.

In brief, the evidence on trends in unemployment and the factors behind it in the technologically leading States, during the second phase of green revolution rejects the assumption of lack of complementarity between biological technology and labour displacing mechanical technology. The complementarity has been leading to stagnancy in real wages and rise in unemployment rate.

POVERTY

Those who advanced the polarisation thesis also contributed to the immiserisation theory. However, cross sectional studies do not appear to support the immiserisation thesis. They suggest that agricultural growth reduces the incidence of poverty both among cultivators and agricultural labour groups, while proletarianisation contributes to growing immiserisation and poverty [Radhakrishna and others, 1983]. However, cross

sectional studies do not provide a valid test of technology effects in relation to immiserisation since areas at different levels of development and different institutional forms are being compared. Temporal and longitudinal studies need to be combined with cross-sectional studies. Temporal studies at the aggregate level show a marked decline in poverty in the late 1950s, a steep rise between the early and mid-1960s, a sharp fall in the early 1970s, a moderate increase from the early to mid-1970s and a moderate decline in the late 1970s and early 80s (Mellor and Desai, 1985). Mellor and Desai saw the impact of land reform and area expansion as being associated with, if not responsible for, the fall in poverty in the late 1950s and the green revolution as the motivating force behind the reduction in poverty as in the late 1960s. Trends in the incidence of State specific poverty [Mahendra Dev, 1988], shown in Table 9, highlight the comparative progress of technologically leading States in relation to technologically lagging States. The table shows also changes in labour productivity.

No doubt, the technologically leading States had an initial advantage in labour productivity. The labour productivity of Punjab in crop production at the beginning of green revolution was four times the corresponding labour productivity of Bihar. Similarly the labour productivity of Haryana was three times the labour productivity of Bihar. In this context, productivity augmenting effects of technology contributed to rapid reduction in the incidence of poverty. In the context of high growth rates in agriculture, despite proletarianisation and the more recent trends in casualisation, technology did not have the immiserising effects. A couple of reasons could be given for this favourable situation. Whatever proletarianisation that we observe in the technologically leading States is not due to pauperisation and sale of land of small owners. While there is no doubt a shift of land from the non-cultivator to the cultivating class land market studies show that such transactions have not resulted in greater inequality in the distribution of land among cultivating owner households; rather a mild centripetal tendency is revealed by the small increase in the share of the owned land of the small owner-cultivator category [Shergill, 1990, pp 18-19, Sheila Bhalla, 1981 and 1983]. Secondly, if there was a continual reduction in poverty in the technologically leading States despite the stagnation in real wages in agriculture and the rising incidence of unemployment it was due to the rising share of non-farm incomes of marginal and small farmer class [Chadha, 1986, pp 244-246]. The sustained growth of such incomes is another matter, which we shall consider in a later section.

A number of other indicators also suggest the inapplicability of immiserisation thesis of HYV technology to the technologically leading States. In these, rural consumer have shifted away from high consumption of cereals and obtain a much lower per-

TABLE 7: EMPLOYMENT AND OUTPUT GROWTH (1977-78 OVER 1972-73): TECHNOLOGICALLY LEADING AND LAGGING STATES

| State | Percentage Change in Employment in Agriculture | Percentage Change in Output in Agriculture |
|--------------------------------|--|--|

tage of calorie intake from cereals as compared to lagging States. The cereal consumption levels in technologically leading States, as in 1983, are lower as compared to technologically lagging States, even while the calorie intake levels are higher. Percentage of protein intake from milk is 15.90 for Punjab and 14.61 for Haryana as against 2.49 per cent in Bihar and similarly low levels in Orissa and Madhya Pradesh [Sarvekshana, October-December, 1989, relevant tables]. Further, cereal consumption expenditure, as in 1986-87 [Sarvekshana, April-June, 1989, relevant tables] formed only 11.20 per cent of total expenditure, as against around 40 per cent for Bihar and similarly high levels in Madhya Pradesh and Orissa under conditions of high incidence of poverty.

In brief, evidence suggests that immiseration is associated with technologically lagging States with poor agricultural performance, and not with technologically leading States. The institutional requirements for technological progress however require attention [Parthasarathy, 1986]. Further, the role of the State in promoting technological progress as well as in moderating its adverse effects in technologically leading States is no less important [Chadha, 1986, p. 331].

IV

Inequalities, Non-Farm Employment and Capitalist Farming in Technologically Leading States

The concept of immiseration considered earlier relates only to absolute poverty. Peter Townsend who has made a pioneering and far reaching contribution in the area of poverty remarks that any rigorous conceptualisation of the social determination of need dissolves the idea of absolute need. American sociologists, Miller and Roby consider that poverty should in fact be viewed straightforwardly as an issue of inequality [Sen, Amartya, 1984, pp. 327-330].

A recent study based on the farm family budget survey data relating to 14 successive years for the period 1969-70 to 1982-83 in Haryana [Satya Paul, 1989] throws some light on the distribution of income. The study reveals a persistent decline in per capita landholding and lack of off-farm employment opportunities has been noted to be responsible for the absence of significant improvement of per capita income of the farm family and also an increase in per capita income disparity (in terms of Gini coefficient) among farm families.

For Punjab the facts on distribution of income are rather dated and pertain to those drawn from a study for 1974-75 [Bhalla and Chadha, 1982, and Chadha, 1986, pp. 243-245]. The 1974-75 study showed that per capita farm business income moved hand in hand with per capita land in a Non-farm income provided about 65 per cent of the total household income of marginal

farmers and about 37 per cent of the income of the small farmers. These kept the total incomes less unequal than farm business incomes, and the Gini coefficients were lower for the former as compared to the latter. Yet as in 1974-75 about one-third of the marginal farmers and 24 per cent of the small farmers were below the poverty line [Bhalla and Chadha, 1982, EPW, p. 876]. We have no access to studies on the distribution of income in Punjab for recent years. But if Haryana study is a pointer we should expect a slackening of the off-farm opportunities for the small and a rise in income inequalities.

SOCIALLY OPPRESSED GROUPS IN TECHNOLOGICALLY LEADING STATES

In the technologically leading States of Punjab and Haryana, scheduled castes form a much higher percentage of the total population than all India average. In Punjab, as in 1983, they formed 26.87 per cent, in Haryana, 19.07 per cent. These proportions are higher than the corresponding percentage for Bihar, Orissa and Madhya Pradesh. In Punjab 85 per cent of agricultural labour households were drawn from the scheduled castes, 90 per cent of the agricultural labour households were landless. It is of interest to note how the position of the scheduled castes was affected in the technologically developed States as compared to technologically backward States. In absolute terms, one should expect the position of scheduled castes to be better in the technologically advanced States. The empirical facts lend support to such an assumption. The per capita consumption expenditure for a period of 30 days as seen from NSS Round for 1983 [Sarvekshana, January-March, 1989, relevant tables] of a scheduled caste household in Punjab was Rs 132 as against Rs 76 for Bihar, and similar levels for Orissa and Madhya Pradesh. But what we seek to know is the relative position of scheduled caste household in a technologically leading State as compared to a technologically lagging State. For this purpose we compare the percentage expenditure of scheduled caste households with the corresponding expenditure of all rural households. The results are: Punjab, 77.54 per cent, Haryana, 76.20 per cent, Bihar, 81.08 per cent, Orissa, 89.54 per cent, and Madhya Pradesh, 86.45 per cent. Even while the absolute position of a scheduled caste households improves in the technologically advanced States, the relative disparities rise.

Similar disparities are seen in the incidence of unemployment of the scheduled castes and others. In Punjab, as in 1983, the daily status unemployment among the usually employed is 10.77 per cent among the scheduled castes as against 2 per cent for others among males. This may be compared with the position at the all India level. This shows that daily status unemployment for the usually employed among scheduled castes is 9.78 as against 4.56 per cent for

others [Sarvekshana, July-September, 1989, relevant tables]. The disparity ratio is seen to be higher in the technologically advanced State. The study of Chadha and Khurana comparing Punjab and Bihar [1989] which underlines the importance of higher levels of non-farm employment in Punjab as compared to Bihar does not focus on the disparities between scheduled castes and others.

The disparity ratios are seen to be higher in Punjab as compared to the all-India level even in respect of social indicators. In Punjab the ratio of children (age 5-14) among scheduled castes attending schools to children of the corresponding age-groups among others is 0.65 as against 0.83 all-India [Sarvekshana, July-September, 1989]. Similarly the ratio of infant mortality rate of scheduled castes to others is higher in Punjab as compared to all-India [Child in India, 1985, Table 2.34].

Thus technologically developed States are marked by growing inequalities between social groups, between cultivators and labourers, and within cultivators among the subsistence and capitalist farmers. A further factor to be considered is the high rate of unemployment among the educated within weaker section households of rural Punjab [Chadha, 1986, p. 301]. The extent to which fundamentalism is fuelled by failures in expectations of the lower classes, and failures in politicisation and in organisation along class lines, in the context of rising consumerism, is a point to be considered.

In brief, even while technological advancement is associated with reduced absolute poverty, it is associated with growing social discontent [Gill, 1989]. It is the form of discontent which varies between technologically developed and technologically lagging States.

INEQUALITIES, TECHNOLOGY AND NON-AGRICULTURAL EMPLOYMENT

HYV technology is said to contribute to sustained growth and poverty alleviation not only through its contribution to improved agricultural performance but also through the strong linkages between the agricultural sector and non-agricultural sector. Consumption or demand induced linkages are the main factors in fostering inter sectoral relationship [Vyasa, 1985, p. 189].

Such linkages have contributed to higher rates of growth of non-agricultural workers in the technologically leading States. As a result of these differential rates of growth of non-agricultural employment, the proportion of non-agricultural households in the total rural households in Punjab and Haryana, as in 1983 [Sarvekshana, April 1988, Table 3.1] exceeded the corresponding proportions for technologically lagging States. In Punjab the proportions of non-agricultural households in total rural households was 34.21, in Haryana, it was 19.12. The differences between the two groups of States are more in respect of

percentages under non-agricultural households employed for wages in agriculture than under self-employed non-agricultural employment. It is possible that non-agricultural self-employment in the technologically lagging States is of a residual character *a la* Vaidyanathan [1986].

The importance of non-agricultural wage employment in technologically leading States can be seen more sharply by comparing the percentages of non-agricultural labour in total rural wage earners as in 1983. In Punjab and Haryana the percentages are 20.05 and 36.08 as against 6.40 per cent in Bihar, 11.13 in Orissa, and 10.32 in Madhya Pradesh.

The impact of non-agricultural growth on the occupational structure in the technologically leading States as compared to the technologically lagging States is more sharply seen when the combined data of NSS 38th Round for rural and urban are considered.

There is no doubt that technology induced high rates of growth have contributed to higher rates of growth of non-agricultural employment. But, the sustained progress of non agriculture within the rural context appears doubtful. Firstly on the demand side, recent studies [Vaidyanathan, 1986, Mahendra Dev, 1990] show a significant negative relationship between inequalities in rural assets and the percentage of non agricultural employment, even while there is a significant positive relationship between productivity of land and non agricultural employment. Secondly, there is the question why the rich farmers did not transform themselves into industrial capitalist. The capital that grew with the green revolution is eager to find its self expansion through conservation of industrial capital but, the outlets are seen to be few and precarious. The entry point, mainly a small firm, does not seem very attractive in terms of the profit rate. One need not be surprised if a notable success of the green revolution in India, namely spawning a generation of farmer capitalists ends up in failure as the process of transition from crowding capitalism to what may be called silicon capitalism is aborted in the midway because of the new economic policy [Ranjit Sau, 1988, *EPW*, 1, 794]. A third factor relevant to the question of sustainability of capitalist farming is also important. Concentration and consolidation of land in capitalist farms in the technologically leading states was not through shift of owned land of the marginal and small owners but mainly through resumption of leased-in land for self cultivation and partly through leasing in. Rent rates dominant in lease markets are usually so high that they in fact preclude any constant appropriation of profits created by the exploitation of wage labour. Rastyannikov points out that in the developing countries of Asia agrarian capitalism has not been able to assert itself on rented land to any significant extent, or in other words land renting has failed to become an effective instrument for the capitalist mobilisation of land and booms

of capitalism wane on rented lands [Rastyannikov, 1981, p 251].

The fourth aspect of capitalist growth within agriculture relates to its heavy dependence on input subsidies [Ashok Gulati, *EPW*, 1989]. The total input subsidies as percentage of net SDP at factor cost in agriculture for the period 1980-81 to 1986-87 was estimated to be 22.49 per cent in Haryana and 24.48 per cent in Punjab, as against 16.40 per cent in all-India [Gulati, 1989 Table-6, p A-63]. If one looks at these input subsidies on the basis of per hectare of gross cropped area (GCA) in different States, Punjab ranks the highest with Rs 1,027 per hectare as input subsidies followed by Haryana [Gulati, 1989, p A-64]. There is not only a regressive pattern of subsidies across the States, but within a State subsidies benefited mostly the top group and provided props to capitalist farming.

There are also questions relating to high and rising energy costs besides issues of sustainable agriculture development which are relevant to considerations of the future of capitalist farming in the technologically leading States. In this context, given the continued advantage that small farmers have in respect of cropping intensity, and of the reappearance of inverse relationship between farm size and net operated acre [Hanumantha Rao, 1989, p 8] leasing out by the large farmers and leasing in by small farmer need not be ruled out. This is a possibility in the event of slackening of absorption of rural people in non agriculture.

V Class Formation in Technologically

Leading and Lagging States

Growing social conflict is observed both in technologically developed as well as in technologically lagging States. The difference is in respect of its articulation as class formation has differed between the two groups of States.

In both Punjab and Haryana technological progress under condition of high land man ratios did not conflict with employment during the first phase of green

revolution. The early phase of green revolution was also not marked by the demise of land-less tenants and their transformation into agricultural labourers. It was during the second phase of green revolution, with the rise in the proportion of rural labour households, faster pace of introduction of labour displacing machinery, lower rate of labour absorption within agriculture and reduced access to land for the landless and the small owner even within the lease market that there were conditions for social conflict within the rural society. But the unique nature of the labour market has inhibited class consciousness. Both in Punjab and Haryana pace of casualisation of labour has been slow because there has been a shift from casual to permanent labour with larger contracts and debt bonds within the permanent farm servants from *Sanjhi* to *Naukar*. Further the permanent farm servants are drawn from a class of small cultivators [Byres, 1981]. In north west India, partial proletarianisation in conjunction with a shift in the structure of hired labour force away from casual labour and towards permanent or attached labour, longer contracts and the particular nature of the contracts certainly meant the inhibiting of class consciousness. The part of wage labour which comes from households whose main source of income is cultivation, and which constitutes a sizeable proportion of the labour force is likely to have the most limited proletarian consciousness [Byres, 1981].

TABLE 10. NON-AGRICULTURE WORKERS IN TECHNOLOGICALLY LEADING AND LAGGING STATES, 1983
(Rural and urban percentage)

| State | Percentage of Workers in Non agriculture | |
|-------------------------|--|---------|
| | Males | Females |
| Technologically leading | | |
| Punjab | 41.8 | 21.7 |
| Haryana | 40.5 | 50.8 |
| Technologically lagging | | |
| Bihar | 28 | 14.8 |
| Orissa | 41.3 | 21.5 |
| Madhya Pradesh | 27.0 | 10.7 |

Source: Mahendra Dev (1988) *Indian Economic Review*, Table 3 and 6

The sources of growth of the class of agricultural labour households are also of interest in appreciating the lack of class consciousness in the technologically leading States. The increased share of agricultural labour households is not due to pauperisation of the peasantry, but is more due to shift of unpaid workers from small cultivator families to better paid agricultural labour [Sheila Bhalla, 1981].

As distinguished from the agricultural labour class, which continued to be segmented, the capitalist farmer class in the technologically leading States, thanks to the integration of the local markets with wider markets and local power structure with wider power structure, could forge strong links and transform itself to a class-for-itself. The market integration, facilitated by the green revolution, coincided with social integration as the barriers of sub-castes within the forward peasant caste groups are broken. The power of this class is used to wring a variety of concessions from the State and Union governments and sustain the progress of capitalist farming.

In the technologically lagging States there is sharper social conflict than in the technologically leading States. High land-man ratios, and higher degree of proletarianisation and casualisation in the context of growing demographic pressures and immiserisation have been causing conflicts. The conflicts are intensified in the tribal area as the traditional sources of survival of the tribals get eroded with commercialisation.

Even in other areas, privatisation of the common property resources has affected the survival of marginalised households. Unlike the technologically leading States, the technologically lagging States have less favourable agro-climatic conditions. The land tenure institutions also continue to be unfavourable for technological progress consistent with poverty alleviation. For instance in Bihar the effects of zamindari abolition were uneven and depended upon the structure of landholdings that existed below the zamindars. In Bihar the biggest beneficiaries of zamindari abolition were the smaller village landlords who themselves were the tenants of the zamindars and were from the upper castes. The extent to which the cultivator got the title to land was directly related to their position in the caste structure. Here, the tendency of upper caste landlords to transform themselves into capitalist landlords is not very strong and they retain feudal relations of production and exploitation. The backward caste landlords have made the transition to landlord capitalism. More than 30 per cent of the land is under different forms of tenancy, almost all of it unrecorded. The tenants are usually from the backward castes, very few from the dalits [DN EPW, May, 1988]. Wide practice of bonded labour, usury and absence of a capitalist labour market kept labour market segmented. It prevents the formation of class-for-itself despite the growth of casual labour.

The role of caste as a factor in preventing the mobilisation of labour along class lines against feudal forces in the technologically lagging States has been quite important. Landlord capitalism uses castes mobilised along caste lines. The scheduled caste commissioner, B D Sharma writes:

The landowners on their side began to organise largely on caste lines raising castes like the Brahmarshi Sena by the Bhumihars, Bhumihars by the Kurmis and Lorik Sena by the Yadavas. Thus the state of confrontation followed almost everywhere. A number of armed clashes take place in which the police is alleged to have sided with the landlords in suppressing agricultural labourers who have been nicknamed as Naxalists [28th Report, p 250-251].

Thus in both technologically leading and technologically lagging States despite trends in proletarianisation and casualisation, segmentation of the labour market, caste factors, and violent suppression of trade union activity among rural labour with the support of the police, have arrested the growth of class forces of labour. On the other hand market integration has also been associated with the growing political power of the land owning class with increasing caste and class solidarity over wide regions.

CONCLUSION

Early writings on green revolution exaggerated the consequences of technology in relation to capitalist farming and polarisation. The ceiling legislation as well as the interventions of the government on behalf of the marginal and small farmers together with the imperfections in the land market have kept these processes much slower than were anticipated by the critics of green revolution. However, technology induced changes in the lease market were more marked in technologically leading States. These contributed to growing proletarianisation and casualisation despite lower demographic pressures on land in this group of States. Such growth in proletarianisation and casualisation has been more due to drift of workers within marginal and small owner household into wage labour than wholesale transformation of peasant owner households into proletarian households suggesting the stubborn persistence of small peasantry.

Increased rates of proletarianisation and casual labour are to be observed both in technologically leading and technologically lagging States. In fact, the proportion of wage labour in total rural households as well as the degree of casualisation of rural workforce were higher, to start with in technologically lagging States with generally high demographic pressures. The technologically lagging States also continued to have higher proportions of wage labour and also higher degree of casualisation in the early 1980s as compared to technologically leading States, suggesting that demography and stagnation have contributed as much to proletarianisation and casualisation as the

new technology. The high rates of decline in access to leased-in land for the small coupled with emergence of middle and large owner as tenant have increased the rates of growth of proletarianisation and casualisation of labour in technologically leading States.

Proletarianisation and casualisation have not been associated with immiserisation in technologically leading States contrary to the predictions of the critics of the green revolution. At the same time, the enthusiasts of the green revolution are proved wrong in assuming lack of complementarity between biological technology and mechanical technology. As mechanical technology followed the biological technology, technologically leading States show higher rates of unemployment in agriculture and stagnation in real wages.

Though immiserisation is not associated with technology, the second phase of technology is characterised by higher degree of inequality, particularly between the socially oppressed scheduled castes and other groups within rural areas. Such inequalities may be expected to rise with reduced labour absorption rates, stagnant real wages and growth in the rates of unemployment in the rural areas. In the past the growth in non-agricultural employment has provided relief but sustained growth in non-agriculture in the technologically leading States is proving to be difficult. Considering the demand side, growing rural inequalities are found to have a negative relationship with the rate of growth of demand for non-agricultural products. From the supply side, the outlets for conversion of agrarian capital into industrial capital are seen to be few and precarious. The slackening of the rate of growth of non-agriculture, and the pressure of the marginal farmer and small farmer on the lease market might push up the rent and it should not be surprising if capitalist farming, based on leased in land and subsidies, becomes non-sustainable. The transition from the green to red revolution through class formation and conflicts was one of the themes in the early writings of critics of green revolution. But, in technologically leading States proletarianisation and casualisation have not been accompanied by immiserisation and this development blunted class conflict. Technologically lagging States witness such association and also more intense conflicts. But in this group of States, violent suppression of trade union

activity among rural labour by land owners' private armies organised on caste lines with the support of the police have kept in check the growth of organised movement of labour. The more important factor is the emergence of the capitalist farmer class into a class-for-itself for wringing a variety of concessions from the state for sustaining the progress of capitalist farming, while the politicisation of the labour and consequently the transition from class-in-itself to class-for-itself continued to be weak.

ACCOUNTING POLICIES AND NOTES FORMING PART OF THE ACCOUNTS FOR THE YEAR ENDED 31ST MARCH, 1991

I) PRINCIPAL ACCOUNTING POLICIES

(1) General

The accompanying financial statements have been prepared on the historical cost basis and conform to the statutory provisions and practices prevailing in the country

(2) Transactions Involving Foreign Exchange

Monetary assets and liabilities as well as outstanding Forward Exchange Contracts are translated half yearly at rates prescribed by FEDAI and the resulting profit/loss is accounted for. Guarantees, Letter of Credits and Acceptances are translated at TT (Middle) rates

(3) Investments

Investments are valued at the lower of cost or market value. Unquoted investments are taken at book value

(4) Advances

(a) Provisions for doubtful advances have been made to the satisfaction of the auditors in respect of identified advances based on a periodic review of advances and after taking into account the realisable value of securities and the portion of advance guaranteed by the Deposit Insurance and Credit Guarantee Corporation, the Export Credit & Guarantee Corporation and similar statutory bodies

(b) Provisions in respect of doubtful advances have been deducted from advances

(c) Provisions have been made on gross basis

(5) Fixed Assets

(a) Premises and other fixed assets have been accounted for at their historical cost

(b) Depreciation has been provided for on the diminishing balance method

(6) Staff Benefits

Provision for gratuity/pension benefits to staff has been made on an accrual basis. Separate fund for pension has been created

(7) Net Profit

(a) The net profit disclosed in the profit and loss account is after

(i) provision for doubtful advances
(ii) provision for depreciation on the value of assets which are valued at lower of cost or market value
(iii) usual expenses

II) NOTES ON THE ACCOUNTS

1. All expenses incurred in the year have been provided for at the rate of 5% furniture and fixtures, 10% on plant and equipment, 15% on motor vehicles, 20% on buildings, 25% on other assets specified in the Schedule VI to the Companies Act, 1956.

2. (a) Head Office administrative expenses have not been charged in the accounts and provision for taxes has been computed without deduction of such expenses

(b) Rent rates and taxes include Rs. 14,29,48,800 being provision for Income Tax

3. Inter Office balance is net of Rs. 9,68,16,000 being amount received from Head Office for the acquisition of residential premises for Bank's officers

AUDITOR'S REPORT

1. We have audited the attached Balance Sheet of Indian Branches of The Bank of Tokyo Limited as on 31st March 1991 and also the annexed Profit and Loss Account for the year ended on that date in which are incorporated the returns from Calcutta and New Delhi Branches audited under Section 228 of The Companies Act 1956 by other auditors

2. In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949 read together with the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section (c) of Section 227 of The Companies Act, 1956 the Balance Sheet and Profit and Loss Account are not required to be and are not drawn up in accordance with Schedule VI to The Companies Act, 1956. The Accounts are therefore drawn up to conform with Forms A & B of the Third Schedule to the Banking Regulations Act, 1949. Subject to the foregoing observations we report that in accordance with sub-section (3) of Section 30 of the Banking Regulations Act, 1949

(a) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory

(b) The transactions of the Indian Branches which have come to our notice have been within the powers of the Bank

(c) In our opinion proper books of account as required by law have been kept by the Indian Branches of the Bank so far as appears from our examination of those books

(d) The report on the accounts of Calcutta and New Delhi Branches of the Bank audited by the respective Branch Auditors were received and properly dealt with by us while preparing our report

(e) The Balance Sheet and the Profit and Loss Account dealt with by this report are in agreement with the books of account and the returns

(f) In our opinion and to the best of our information and according to the explanations given to us the said accounts give the information required by The Companies Act, 1956 in the manner so required for banking companies and read together with the notes give a true and fair view

(g) In the case of the Balance Sheet of the state of affairs of the Indian Branches of the Bank as at 31st March 1991 and

(h) In the case of the Profit and Loss Account of the Profit for the year ended on that date

Wages, Employment and Output in Interrelated Labour Markets in an Agrarian Economy

A Study of Kerala

T N Krishnan

This paper examines the wage structure and wage movements and their relation to employment and output in an agrarian economy in transition. In order to explain wage movements in such an economy, the paper develops the concept of 'interrelated labour markets'.

The paper is divided into four sections. The first section analyses the wage structure in agriculture and in construction activity both in the rural and urban sectors for those categories of labour that are paid daily wages. The validity of the concept of interrelated labour markets is verified by estimating vector autoregressions and testing for significant causal relations among the included wage rates. The second section develops a theory of wage structure in the context of interrelated labour markets which emphasises the importance of social norms in labour market behaviour. The third section examines movements in wage relativities in relation to changes in product demand. The final section develops analytical model to explain employment behaviour in interrelated labour markets and applies this model to explain the changes in employment and output in the agricultural sector of the Kerala economy.

THE determination of wages, employment and output is central to economic analysis and, therefore, the behaviour of labour markets continues to be an important area of research both in industrially advanced economies and in poorer agrarian economies.¹ Among the various theories proposed to explain the operation of the labour market in poorer agrarian economies, the one based on the concept of 'interlinked markets' is the most prominent one.² The term 'interlinked' is employed to describe a situation in which the free operation of a labour market is constrained as a result of various institutional linkages between the land and credit markets which result in the formation of patron-client relationships or in implicitly lower wage rates.

The emergence of a dual labour market in the course of the development of a backward agrarian economy is well recognised in development literature, what is not so well understood is the fact that all categories of employment in the modern sector—whether skilled or unskilled, and irrespective of opportunities to climb up a job ladder—constitute the primary labour market as understood in the literature on labour market segmentation. This is because jobs in this sector are full time and provide greater security and invariably higher earnings.³ Employment in the modern sector comprises not only jobs in the developing industrial sector but also in such areas as government service, public enterprises and utilities, financial services, etc. Not all jobs require high education or specialised skills and there are long waiting periods for securing employment.

The market for labour in the traditional sector—comprising mostly non-plantation agriculture, traditional household and small scale industries, construction activity, wholesale and retail trade—is akin to the secondary labour market because it encompasses the bulk of the illiterate unskilled members of the labour force, for a majority of whom employment is seasonal, irregular,

and wage rates are low. Those who are not employable elsewhere finally end up in this sector.⁴ The inability of employment to keep pace with the growth of population and of labour force is reflected in a decline in the number of days of employment available for each person rather than in an increase in the number of totally unemployed persons.

This paper examines the wage structure and wage movements and their relation to employment and output in an agrarian economy in transition. In order to explain wage movements in such an economy, this paper develops a concept of what shall be called 'interrelated labour markets' (to be distinguished from current theories of 'interlinked markets'). Some of the findings reported in this paper are at variance with the conclusions of the major studies on agrarian labour markets. At the same time, it appears that some conclusions from recent theorisation on the relationships among wages, prices and employment in the developed industrial economies are relevant for the present analysis. First and foremost is the conclusion that the wage structure in this economy follows a hierarchical order reflecting social custom, which results in a strong tendency for wage relativities to remain stable over the long run.⁵ Second, this study demonstrates that markets for different categories of labour can indeed be interrelated and that such interrelationships operate through the wage structure even in the absence of inter-market labour mobility. It is shown that a rise in the wage rate of any category of labour within a structure of interrelated labour markets is transmitted to other wage rates in order to re-establish wage relativities, and this appears to be independent of the degree of unionisation of any category of labour. Finally, it is found that a weakening of product demand is reflected in a widening of the relative wage differential in the short run and the effect of a rise in wages on employment and output is mainly determined by the conditions of pro-

duct demand and the rate of technological change.⁶

More specifically, this paper analyses the wage structure and wage movements in the traditional sector and the effects of wage movements on employment and output in agriculture in Kerala. The paper is divided into four sections: the first section analyses the wage structure in agriculture and in construction activity both in the rural and urban sectors for those categories of labour that are paid daily wages. The validity of the concept of interrelated labour markets is verified by estimating vector autoregressions and testing for significant causal relations among the included wage rates. The second section develops a theory of wage structure in the context of interrelated labour markets which emphasises the importance of social norms in labour market behaviour. The third section examines movements in wage relativities in relation to changes in product demand. The final section develops an analytical model to explain employment behaviour in interrelated labour markets and applies this model to explain the changes in employment and output in the agricultural sector of the Kerala economy.

THE SETTING

Labour households constituted 49.6 per cent of total rural households in 1983-84 in Kerala—one of the highest figures for any State in India.⁷ Of 1.78 million labour households in rural areas, 9,68,000 households were agricultural labour households and the rest were other labour households.⁸ As in many other parts of India, the rate of increase in the number of labour households exceeds that of non-labour households by a large margin, reflecting the fact that labour households increase not only demographically but also because economic circumstances force households of other classes into their ranks. In fact, between 1974-75 and 1983-84, the proportion of non-labour households declined from 57.8 to 50.4 per cent, in addition, their absolute numbers

declined from 1.87 million to 1.80 million.⁹ This implies that all the net increase in rural households were absorbed by the labour households. As there was only limited room to absorb them as agricultural labourers, most of this increase occurred among non-agricultural labour households. While the proportion of agricultural labour households declined from 28 per cent in 1964-65 to 27 per cent in 1983-84, those of other rural labour households rose from 14 per cent to 23 per cent during the same period.¹⁰ The agricultural sector has had negative growth rates since 1975 which provide further evidence why such a shift was necessary between agricultural and non-agricultural labour households. In either case the total number of days of employment for a worker declined during this period.¹¹

From 1975 the State domestic product barely managed to grow faster than population (which had indeed begun to decline) but the per capita level of consumption rose at a higher rate due to remittances of incomes by those who were employed in West Asia. The estimated per capita consumer expenditure of Rs 2,436 in 1986-87 was higher than the estimated per capita State domestic product of Rs 2,371.¹² If we assume that the

per capita consumer expenditure constituted 80 per cent of the per capita disposable income, then the estimated figure of the latter would be Rs 3,045, implying that remittances might have been as high as 28 per cent of the income produced within the State.¹³

Though Kerala's economy is integrated fully with the all-India economic structure, many features of Kerala's labour and commodity markets are quite distinct from the pattern prevailing in the rest of the country. The relationships and interlinkages between the rural labour, land and credit markets in different regions of India as envisaged in the relevant literature are almost non-existent in Kerala.¹⁴ This is the result partly of extensive reforms in land ownership and tenancy and partly due to the political and organisational mobilisation of labour. This mobilisation of labour led to the rapid growth of trade unionism not only among agricultural, industrial and public service employees, but has now spread to the informal labour sector also. The rapid growth of labour unions among labourers in the informal sector is a consequence of the substantial increase in the size of the non-agricultural labour force, especially since 1975. Perhaps Kerala

represents one of the few regions where workers in the informal sector are organised and unionised; this fact cannot but have important repercussions on the economy. Unionisation was aided by the high literacy levels of the Kerala labour force; literacy also helps to transmit labour market information rapidly. That higher literacy itself contributes to a weakening of the traditional interlinkages noted by the first committee appointed to fix minimum wages for agricultural labourers as early as 1956 in its report.¹⁵

There are three other features of the labour market which distinguish Kerala from other States. The first relates to the rate of unemployment.¹⁶ Kerala has the highest rate of rural unemployment in India. The second is the comparatively high rate of participation of women in the labour force.¹⁷ A third feature is that Kerala has the third highest wage rate for agricultural labourers in the country, after Punjab and Haryana (see Table 1). The male wage rate is 90 per cent higher than the wage rate prevailing in the neighbouring State of Tamil Nadu.

Estimates of real wages for different States in India are given in Table 2. The real wage rates have been estimated using the cost of

Note: We have used the Agricultural Labourers Cost of Living Index of the respective States to derive the real wage rates.

living indices of the respective States. In 1960, Assam, Gujarat, Karnataka, Punjab, Uttar Pradesh and West Bengal had higher money wages and higher real wages than Kerala. This position changed significantly and by 1987 only Punjab, Haryana (which was earlier part of Punjab) and West Bengal had higher wage rates than Kerala.

I

Wage Structure in Kerala

Three factors of wage movements in an economy are important for this analysis. First, any single wage rate is only one element in a wage vector and therefore it is more appropriate to study the relationships among the whole set of wage rates than to study a single wage rate.¹⁸ Secondly, wage rates have a history of their own and a current wage rate is probably not independent of its past behaviour. Thirdly, institutional and social factors are perhaps more important in the determination of wage rates than the conditions of supply of and demand for labour in any market.¹⁹

Most wage studies in agrarian economies analyse the determination of a single or at most two wage rates in the agricultural sector, ignoring the fact that agricultural wages might be influenced by or related to other wages in the system. Much attention has been bestowed on describing the operation of interlinked markets in India with the result that few studies have been undertaken in other categories of labour. It is probably true that as an economy undergoes change, the social and institutional relationships also change, but we have very little information on the pace and pattern of these changes. Social and institutional changes do not take place in a discontinuous and discrete manner but represent gradual and continuous change over time. It is in this sense that the historical context becomes important in an analysis of labour market behaviour.

In this paper we analyse the wages of eight categories of rural labour belonging to the construction and agricultural sectors of the Kerala economy. These categories are those of mason, carpenter, unskilled man and unskilled woman for the construction sector, paddy field male worker, paddy field female worker, other agricultural male worker and other agricultural female worker. In addition, the paper analyses wage rates for construction activity in the urban sector. Annual wage data on construction activity and for paddy field male labour are available for the period 1963 to 1989 and for the remaining categories from 1973. For some categories monthly or quarterly observations are available, and such data have been used as well.

Nominal wage rates have risen without any interruption during the period under analysis for all categories of labour almost at the same average annual rate. Money wage rates in 1989 were about 12 times higher than in 1963. While the cost of living index also rose dramatically, especially since 1974, still real wage rates more than doubled during this period. Kerala happens to be the only state where real wages have nearly doubled

between 1960 and 1990, and this is particularly significant in the light of the observation made earlier that the Kerala economy had practically remained stagnant after 1975. However, the effects of this stagnation were partly offset by the remittances of income by workers from Kerala who migrated in large numbers during this period to West Asia. These accruals of factor incomes not only raised the levels of direct consumption of those families receiving such incomes but also initiated a boom in construction activity.

This study of the wage structure of Kerala begins with an estimation of relative wages (see Table 3). To begin with, we have calculated for each year (or quarter or month as the case may be) the ratio between the wages of workers in each category mentioned in Table 3 and the wage of masons in rural areas. These wage ratios, which lie between 1.00 and 0.41, point to some interesting features of the wage structure in Kerala. When the ratios are arranged in a declining order they fall in a hierarchical order with the carpenter/mason at the top and the female agricultural labourer at the bottom. For each ratio the mean and the coefficient of variation were also calculated and they indicate remarkable stability. The values of the coefficient of variation range between 1 per cent and 10 per cent. As we go down the hierarchical order the value of the ratio declines; in addition the coefficient of variation rises, signifying that the lower the position of a category in the wage hierarchy, the greater the variability in the wage ratios. When the wage ratios are recalculated in terms of wage rates other than that of the rural mason there is no increase in the coefficient of variation.

An examination of the ratios over the period reveals that some reordering of the ratios has occurred after the mid 1970s. The migration of labour to West Asia began at this time and soon led to the construction boom in the State. The decline in acreage under paddy cultivation also started after 1975. All these changes had their effects on labour demand in the respective labour

markets. These are analysed later in this paper.

CAUSAL VERSUS STRUCTURAL FACTORS

The 'stickiness' of the wage ratios and the low values of the coefficients of variation together raise the question of whether the wage rates are all related in some way and therefore move together when a single wage rate changes. To illustrate, certain factors cause a change in a single wage rate. The change in that wage rate triggers a process that tends towards the restoration of the pre-existing parities between wage ratios. This process occurs whether or not the factors that caused the original change are present in other (interrelated) labour markets. A change in a wage structure thus has two component parts: first a change in the wage rate in a single market (the 'initial wage change') and, secondly a consequent change in all other labour markets (the 'induced wage change').

TABLE 4 LIST OF VARIABLES USED IN CAUSAL TESTS

Daily Wage Rates (in rupees) in Rural Sector

- v 1 Mason
- v 2 Carpenter
- v 3 Agricultural labourer (male)
- v 4 Agricultural labourer (female)
- v 5 Other agricultural labourer (male)
- v 6 Other agricultural labourer (female)
- v 7 Unskilled construction worker (male)
- Unskilled construction worker (female)

Daily Wage Rates (in rupees) in Urban Sector

- v 9 Mason
- v 10 Carpenter
- v 11 Unskilled construction worker (male)
- v 12 Unskilled construction worker (female)

Others

- v 13 Cost of living index for agricultural labourers
- v 14 Amount of bank deposits (in crores of rupees) per bank branch (one crore = ten million)
- v 15 Amount of bank credit (in crores of rupees) per bank branch

TABLE 3 MEAN, STANDARD DEVIATION AND COEFFICIENT OF VARIATION OF WAGE RATIVITIES

| Period | Wage Rativity | Mean | Standard Deviation | Coefficient of Variation (Per cent) |
|---------------------|-------------------------------------|------|--------------------|-------------------------------------|
| Rural Sector | | | | |
| 1963-64 to 1989-90 | Carpenter/mason | 1.00 | 0.01 | 1.00 |
| | Unskilled men (const)/mason | 0.62 | 0.03 | 5.0 |
| | Agr lab/mason | 0.45 | 0.03 | 8.0 |
| | | 0.63 | 0.04 | 7.0 |
| 1973-74 to 1989-90 | Other agr male labour/mason | 0.62 | 0.04 | 7.00 |
| | Agr female labour/mason | 0.41 | 0.04 | 10.00 |
| | Other agr female lab/mason | 0.45 | 0.02 | 5.00 |
| | Other agr male lab/agr male lab | 0.99 | 0.02 | 2.00 |
| | Other agr female labour/agr lab | 0.66 | 0.05 | 8.00 |
| | Other agr female lab/agr female lab | 1.11 | 0.11 | 10.00 |
| Urban Sector | | | | |
| 1963-64 to 1988-89 | Carpenter/mason | 1.00 | 0.02 | 2.00 |
| | Unskilled men/mason | 0.61 | 0.02 | 4.00 |
| | Unskilled women/mason | 0.47 | 0.02 | 5.00 |
| | Unskilled women/unskilled men | 0.74 | 0.03 | 5.00 |

These two component parts of wage changes in wage structures need to be kept distinct for analytical purposes. The first factor (or factors) that initiates the wage change may be described as the 'causal factor' (or factors) and the subsequent shift in all the interrelated labour markets may be described as arising from the 'structural factor'. An example of a causal factor is the change in money wages brought about by the rise in the demand for construction labour arising from the building boom; the consequent series of wage changes in other sectors like agriculture in order to restore parity exemplifies the 'structural factor'. Similarly, a chain reaction in wage changes brought about by an initial rise in a wage rate by union action in a single labour market is another example of the operation of a structural factor.

The presence of structural factors resulting in simultaneous adjustments in wage rates in interrelated labour markets complicates the analysis of the factors responsible for changes in the wage structure. This is because the causal and structural components of such a change must be decomposed. While the 'causal factor' represents a unidirectional relationship, the structural factor will lead to bidirectional relationships between wages. In this paper we have employed the Granger-Sims causality procedure to test for the presence of structural relationships rather than causal relationships.²⁰ Sims had proposed the estimation of vector autoregressions to test for Granger causality and for mutual feedbacks between endogenous and exogenous variables.²¹ We estimate vector autoregressions in this paper to test for mutual relationships among wage rates in an attempt to provide an explanation for the apparent stability in the wage ratios.

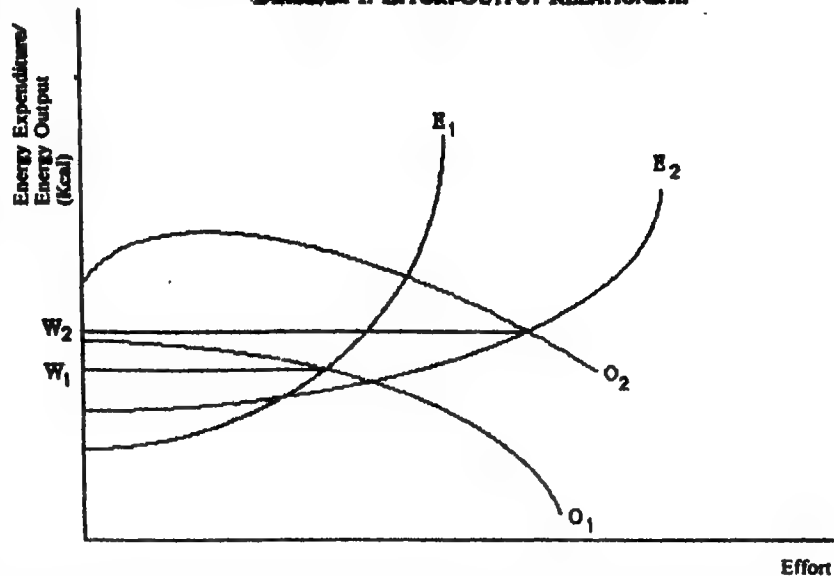

The following VAR model has been estimated with appropriate modifications for data availability:

$$A(L)X_t = U_t \quad (1)$$

where X is an $(n \times 1)$ vector of variables, A is an $(n \times n)$ matrix of coefficients, L is the lag operator and U is an $(n \times 1)$ vector of white noise disturbance terms. The basic premise of the VAR is that future values of X depend on the current and past values of X only.²²

Since the purpose of this exercise is not to derive forecasts of the wage rates but to test the existence of and the direction in Granger causality, we have neither examined the magnitude nor the sign of the estimated coefficients at this juncture. As the presence or absence of Granger causality is determined by the significance of the F-tests, these have been estimated for alternative data sets and their results compared to establish firmly the nature of the relationships.²³ We have estimated VARs with monthly, quarterly and annual data (although, as mentioned earlier, these three sets are not uniformly available for the whole wage vector). However, each set has an intersecting subset of the others and if Granger causality is found in all the intersecting subsets, then the robustness of the

DIAGRAM 1: EFFORT-OUTPUT RELATIONSHIP

relationships can be established without any doubt.

Monthly average daily wage data are available for six occupations in the agricultural sector, namely for masons, carpenters, male workers in paddy fields, female workers in paddy fields, other agricultural male workers, other agricultural female workers. These occupations are in the rural sector. For the urban sector, quarterly average daily wage data are available for four categories of labour in the construction sector, those of mason, carpenter, unskilled male worker and unskilled female worker. These wage rates are for the period 1974 to 1989. Annual average daily wages for the period 1964 to 1989 for building construction workers in the rural sector and for paddy-field male labour are also available. We have therefore estimated VARs with monthly, quarterly and annual data. In the VARs with quarterly data, we have combined, on various theoretical considerations, the rural and urban series. The rural sector is the source of the "unlimited supply of labour" to the urban sector and therefore the level of rural wages may be one of the factors determining the level of urban wages. Interestingly, the rural-urban differential in wages in construction activity for all categories of labour is about 10 per cent and remains constant during the entire period of analysis.

RESULTS OF CAUSALITY TESTS

An important question in estimating VAR concerns the choice of lag lengths in the equations. Recent contributions to the literature discuss some objective criteria for the selection of lag lengths, but in this analysis we have followed an empirical approach, trying different lag lengths and comparing their results. As is now well understood, the causality relationships are not only quite sensitive to lag lengths but the efficiency of the estimates are also affected by them. For instance, the presence or absence of serial correlation seems to be af-

fected by the lag length. There is *a priori* reason to believe that the lags are of short duration: we have noticed that within- and between-year coefficients of variation were small.²⁴ As the length of lag was increased, it was found that the estimates began to show the presence of serious autocorrelation in the residuals. This fact determined the lag structure chosen for these estimates.

The results of the vector autoregressions are given in Tables 5, 6 and 7. Table 8 presents a summary of direction of causality based on the tests of significance. Table 5 gives the values of F's and other summary statistics for the VARs using the monthly wage data for the rural sector. We ran the regressions with lag lengths of 3, 6, 9 and 12 months and found that a lag of 12 past values gave the most satisfactory result from the point of view of serial correlation as well as from the levels of significance of F values. The following linear form was adopted for the estimation:

$$W_t = C + aW_t + P_t + u_t \quad (2)$$

where the W 's are the wage rates and P_t , the cost of living index for agricultural labourers. Cost of living indices are not estimated for construction workers.

Only quarterly observations are available for construction activity in the urban sector. As the source of urban labour supply is primarily the adjacent rural areas, the urban wage rates are likely to be closely related to the rural wages and the conditions of labour demand in the rural sector. The urban wage in the construction sector appears primarily to be determined by adding a mark-up over the rural wage rate. In order to test this hypothesis, we first derived quarterly estimates of rural wages from the monthly wage data and combined these with urban wages. The VARs were estimated using this combined set of wage data. The results are given in Table 6.

Finally in Table 7 we give the F values for the annual data for the rural sector. Only five categories of wages are available on an annual basis—four for the construction

sector and a single wage rate for the agricultural sector. The construction boom in Kerala was initiated by the remittances of workers from Kerala in West Asia after the petroleum price hike in 1974. It would be interesting to test the impact of Gulf remittances on wage rates, unfortunately, data on remittances are not available. However, we know that most of these remittances have been made through the banking system and therefore would be reflected in a rise in bank deposits and in bank lendings. In the annual VARs we have included bank deposits per bank branch and bank credits per bank branch as proxies for remittances.

What do the results indicate on the nature of and the directions in causality among the variables included in the VARs? First, it is important to note that the results of the three independent sets of VARs are consistent with each other. The largest data set employed for the Granger Sims causality tests was the set of quarterly observations of the combined rural and urban wage rates. All those variables which exhibited significant levels of causality were also found to exhibit similar relationships with monthly and annual data sets.

The causality tests lend strong support to the hypothesis advanced earlier that the wage rates are mutually related and operate through feedback mechanisms when wage parities are disturbed until they are re-established. This interdependence of the wages that comprise the wage structure can be seen in terms of four different types of linkages: first, between rural and urban wages, secondly, between skilled and unskilled wages, thirdly, between different types of unskilled wages, and fourthly, between wages paid to men and women.

Beginning with the Lewis model on unlimited supplies of labour, it is a common assumption that the existing wage rate in the agricultural sector defines the opportunity cost of labour in other sectors and therefore wage rates elsewhere in the economy will be closely related to the wage rate prevailing in agriculture. The causality tests undertaken here indicate that almost all wage rates in both rural and urban sectors, are causally related to the wage rates in the agricultural

sector. Though agricultural wages Granger-cause urban wages, the reverse relationship is not generally true except in the case of male agricultural labour (paddy field labour). However, the mutual feedback mechanism seems to be operating within the construction labour market where the urban wages appear significant in the rural wage equations of mason and of carpenter.

The significance levels of F values indicate that the wage rates of masons and carpenters are highly sensitive to unskilled wages. Not only are parities between the wages of skilled and unskilled workers within the construction sector significant, it is also remarkable that the parities between the wages of skilled workers in construction and agricultural wages are equally significant. These relationships turn out to be stronger in the rural sector. There also operates a feedback from the wage rates of mason and carpenter to the wages of male workers in agriculture. In fact this mutual relationship between skilled workers in construction and male agricultural workers constitutes the crucial link in the wage chain. The wages of all other unskilled workers in agriculture, whether male or female, are mutually related through the male agricultural wage rates. In the case of gender differentials in wages, female wage rates appear to be related directly only to the wage rates in the agricultural sector. Their links with the skilled wages in construction are only indirect (via their links with male agricultural wages).

A final important finding relates to the direction of causality between price and wages. Monthly quarterly and annual VARs show that causality does not run in the direction from price to wages but seems to be operable in the opposite direction namely from wage changes to changes in the cost of living index. There is further support for this view when we examine carefully the results of the VARs with annual observations for the rural sector. We included bank deposits per branch and bank credits per branch as proxies for foreign exchange remittances by Kerala workers living abroad. These variables appear significant in the wage equations of mason and carpenter as well as the price equation. This finding sug-

gests that the construction boom was initiated by remittances, in turn, the construction boom led to the rise in the wages of masons and carpenters. Further, remittances and the construction boom were important factors in the increase in the cost of living in Kerala.

II

A Theory of Wage Structure

The analysis presented above raises some important theoretical questions on wage formation, wage structure and the mechanics of the operation of labour markets in Kerala.

- What are the reasons for wage relativities to remain almost stable over the long-run?
- Why have money wages remained 'sticky' downwards when unemployment is increasing secularly?
- Why do the unemployed not offer themselves for work at lower wages?
- What are the reasons for employers not bidding down wages by offering jobs to the unemployed?

In this section we shall attempt to provide some answers to these questions with reference to Kerala's economic performance. These are questions that have been asked not only in the context of development economics but also in reference to the macroeconomic performance of developed economies in recent times. Some of our own explanations may be similar or very close to the explanations put forward in the latter context.

SOCIAL NORMS AND WAGE RELATIVITIES

The Granger causality tests showed that the wage rates were mutually related and that causation ran in both directions. Obviously this deserves explanation. We had pointed out earlier that wage relativities are structured hierarchically and had also noted that the coefficient of variation increases as one moves down in the hierarchy. We adduce here what we consider to be the explanations for their mutual dependence and hence for the stability of the wage relativities.²⁶ This explanation would have to depend on an important attribute of the labour market, namely that it is a historically evolved social institution.

Wage structures are probably universally hierarchical, reflecting occupational and skill differences. But in a traditional society like Kerala, these differences are further reinforced by caste considerations that restrict entry into certain occupations. For instance, carpentry, blacksmith-work, goldsmith-work and masonry are caste-based occupations and persons of other castes neither enter into nor are normally accepted by those who are already engaged in these professions.²⁷ An important aspect of development is social and occupational mobility. While such mobility is still denied in strongly caste-based occupations, masonry is one area where other castes have begun to enter. In the historical evolution of Indian or Kerala society, the caste hierarchy also determined the social ranking order of every group in the society. While historically one's economic position was also closely tied to the caste hierarchy and the social status these links are slowly breaking down. While every group would desire an improvement in its social and economic status, each group would also be particularly concerned with any perceived decline in its hierarchical status and would make every effort to maintain its relative position.²⁸ However, persons belonging to the middle of the caste

hierarchy are joining the ranks of agricultural labour or the construction labour pool due to lack of employment opportunities or when they have neither any asset base to fall back upon nor any training or education to gain entry into better professions.

Any person who lives in a hierarchical society and is aware of and concerned with his status will be constantly comparing himself with those above and below him. Caste hierarchy is determined by birth and thus can be considered as the given initial conditions. Among other factors such as occupation, income and political power, the most visible and also the most easily measurable index of status is income. In the case of hired labour, a ranking on the basis of income will be roughly the same as a ranking on the basis of the level of wage rates, assuming for the present that the quantum of employment is similar for all groups of labour.

There is no *a priori* reason to believe that a labourer who is part of a hierarchical society will behave in a different manner from the rest of the population. He will be concerned with his relative position and will be comparing his wages with the wages of those above and below him. Each and every

group of labourers will be undertaking such comparisons all the time in order to protect their position within the labour hierarchy. We may identify these as vertical comparisons. These vertical comparisons constitute an important factor in the emergence and maintenance of the wage relativities.

Would not a labourer stand to gain employment by offering himself for work at lower than the prevailing wage rate? Are there compelling reasons against doing so? These are important questions in the context of high and increasing unemployment in Kerala. It appears that there are economic as well sociological reasons why a labourer, in the Kerala context, would not offer himself for work for a wage other than the prevailing one. The first factor has to do with the perceived norm regarding the standard of living appropriate to his class or group. This perceived norm is arrived at by a process of horizontal comparisons analogous to the vertical comparisons mentioned above. Just as he is comparing his position with that of those above and below him, he is also comparing his own living standards with those of others who belong to the same occupational group or do similar jobs. If this is true then the own lagged variable should appear significant in the Granger test. The

* Denotes significant Granger causality

It is shown, in fact, that this is so.

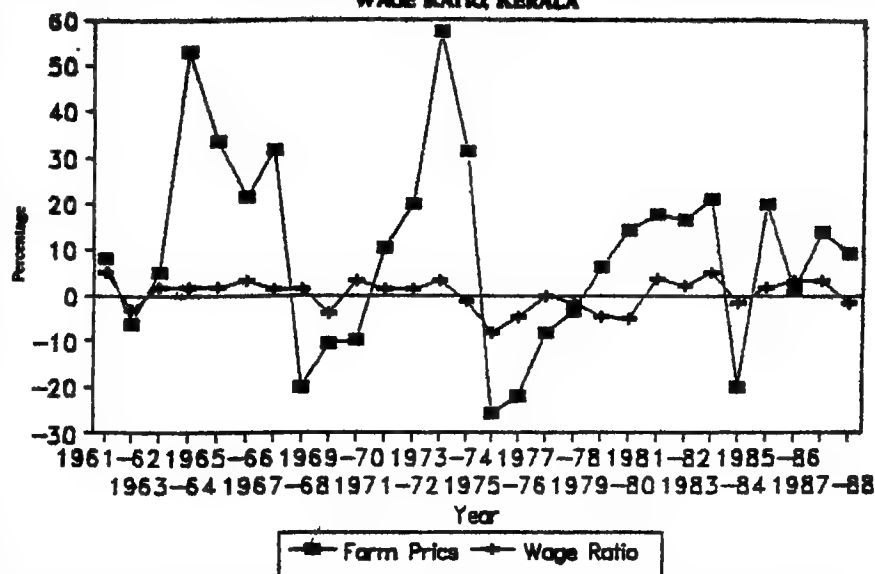

The maintenance of living standards appropriate to the perceived living standards of one's own peer group is crucial to the maintenance of one's social status within the hierarchical structure. Therefore, unless the elasticity of employment with respect to wages is greater than unity, a labourer will not be able to raise his total wage income by accepting a lower wage rate. As every labourer is aware of the employment pattern in the village, there is perfect foresight about the nature of employment. Almost all the employment opportunities are in agriculture which has a rigid seasonal pattern. There is also no incentive to migrate to neighbouring villages in search of work as there is an excess supply of labour in these villages as well and the pattern of employment is similar. Besides, after land reform, every labourer lives in the dwelling to which he or she became entitled and therefore has no incentive to travel far beyond commuting distance. Casual workers in Kerala are closely tied to their roots and they migrate for work only if the compensation is sufficiently high to warrant the dislocation of their residence. Due to all these reasons, the elasticity of employment with respect to wages will be much less than unity and therefore there is no incentive for anyone to offer himself at a wage rate lower than the prevailing one.

Another factor will be the social stigma attached to a labourer if it is known among his peer group that he is working for a lower rate than the prevailing wage rate.²⁹ This social resentment is reinforced by unionism in Kerala, especially among agricultural labourers, which has not only made them aware of their organised strength, but has also instilled in them a deep sense of class consciousness. Anyone who breaks the class norm will be considered to be harming their class interests and is likely to be subjected to social and political pressures to make them resist such deviant behaviour. Such pressures are greater in Kerala than elsewhere in India, since in Kerala agricultural labourer unions are controlled largely by the Leftist parties that enforce union discipline firmly.³⁰

While the explanation provides a rationale for the workers not to accept lower wage rates and strive for the maintenance of wage relativities, there is no apparent reason why the employers should accept such a position. As there is an excess supply of labour in agriculture, if the employers were to organise and collectively offer a lower wage, the labourers would have found it difficult to resist the wage cut. However, such a stalemate has not taken place until now and it is interesting to enquire what might be the reasons for the same.

The first and foremost is the fact that agricultural labour is strongly unionised and therefore wage cuts are resisted on all counts. The arguments in favour of maintaining the wage parities provide a strong weapon to labour unions not only to resist wage cuts but, on the other hand, to enforce the upward revision of wages. In fact, the phenomenon of wage parity maintenance

DIAGRAM 2: ANNUAL PERCENTAGE CHANGE IN FARM PRICE AND IN AGRICULTURAL WAGE RATIO, KERALA

has enabled agricultural labour in Kerala to achieve increases in real wages in spite of rising unemployment.

These wage increases have also been aided by the periodic revision of minimum wages that take into account increases in the cost of living.³¹ Kerala is perhaps the only State in India where the minimum wage notifications are effective and operational. The notification of minimum wages provides another reason for the trade unions to demand wage revisions.

We have some interesting evidence to indicate that the maintenance of wage parities is accepted as a desirable principle by both unions and employers. This principle is explicitly stated in the report of the first minimum wages committee which included prominent trade union leaders as well as influential farmers:

The problem of minimum wage fixation has also to be approached from the angle of comparative wage levels in other occupations; for, ultimately there cannot be any disparity between the standard requirements of an agricultural labourer and of an industrial worker. Too wide a gap between the wages of these categories of workers would not only be inequitable and unjust, but it would also be not conducive to the maintenance of a sound and stable economy. The need to preserve a balance between these two sectors of our economy becomes manifest when we consider this problem in relation to plantation workers. Representatives of the plantation industries feel that if the wages in the plantations are fixed high, having in view the capacity of the employer to pay, then there may be a tendency for agricultural labour in the neighbourhood to migrate to plantations. The disturbance of the balance or relationship between agricultural and plantation wages would seriously affect the agricultural economy as a whole. The same arguments hold good in respect of wages in industries. The problem of fixation of wages is therefore very delicate and difficult. The wages we fix should neither be too high based on idealistic considerations, for it would not only defeat

the purpose of the legislation, but would result in unemployment and loss of production, nor should it be too low, for it would be ineffective in promoting the object of the legislation. To provide a fairly decent standard of living to them is essentially a question of social justice.³²

From the foregoing statement it is clear that the committee was aware of the importance of maintaining the wage parities and at the same was also concerned about the question of social justice.

The committee also mentions that the minimum wage fixed must be a 'fair wage'.³³ What constitutes a fair wage is a difficult question to answer. Employers and employees might have very different notions and mutually inconsistent norms regarding 'fair wages'.³⁴ The idea of fairness in the context of wage relativities needs to be interpreted quite cautiously. Workers may feel that the wages they receive do not reflect what they are entitled to but they might still accept them as long as they are consistent with the historically determined wage relativities. They may feel that the least society can do for them is to adjust their wages in step with changes in other wages. In this limited sense, the prevailing wage parities might have acquired over time the stamp of 'fairness', by providing a societal norm for wage setting. Therefore, any change in wage parities has to reflect a change in this societal norm and can only be a gradual process, reflecting long-run trends in the economy. It is difficult to explain how the original parities got established—their establishment is the result of the interplay of numerous forces—but once established, they form part of the corpus of social customs and norms a society inevitably takes on itself for its functioning.³⁵

The above view regarding wage-setting in the Kerala economy does not imply that the same mechanism will hold good for the other regions of India. The institutional setting of the labour market in Kerala is very distinct in that it is an unfettered labour

market, in the sense that it is not tied to the credit or land markets. Besides, some segments of the market are unionised and can influence the determination of wage rates. Ununionisation of rural labour in the rest of India has not yet taken place.

If the adherence to wage parities is considered a societal norm then it implies that the employers also accept the periodic revision of wages without much resistance. Why they fall in line when there is an excess supply of labour still needs further analysis. An employer may consider the prevailing wage rate too high but will still decide to pay it for two principal reasons. The first factor is the nature of the product cycle in agriculture. Almost all agricultural operations have to be completed within a specified time framework to avoid any damage to the crop, this fact enables the labour force to exercise some monopsony power and thus strengthen its bargaining position. Under these circumstances, the employers would face a reduction in their total output unless they agreed to pay the prevailing wage rate, which would be an important consideration in agriculture where the peak season requirements of labour could be high. This factor is likely to be reinforced by the institutional structure of the labour market in Kerala. The market for unskilled labour is geographically segmented and there is minimal inter-village mobility of labour.

In a local labour market, the employers are aware of the nature of the conditions of labour supply and have some familiarity with those who are seeking work. They are probably aware of the quality of work of different persons and might have even developed some sort of a ranking of workers on the basis of the efficiency of their work.³⁶ This may lead to informal understandings and arrangements between particular sets of employers and employees—employers preferring particular employees on the basis of their perceived levels of efficiency in work. For employers such preferred employees are likely to reduce the opportunity cost of supervision. Such preferences would not entail the payment of any premium over the market wage, but the payment of a wage below the market wage may affect the level of effort and hence the efficiency of work and thus jeopardise the informal relationship between the employer and the employee. Under this situation, the prevailing market wage will be the efficiency wage.³⁷ At the market wage, the labourer will put in the maximum effort and at this wage the supply of labour will be highly elastic. As far as the employer is concerned, at wages below the prevailing market wage rate the important question is not of the elasticity of labour supply but the elasticity of effort. Even if unemployed workers are willing to offer themselves for work at lower wages, their awareness of this situation may be reflected in the level of intensity of their effort and thus result in lower output. Therefore, on grounds of efficiency, the employer will prefer to pay the prevailing wage rate to his most preferred employees and thus minimise his supervisory costs for a given level of output. For the preferred

employees, putting in their best effort minimises their own transaction costs and offers some regularity in employment in a market where there is an excess supply of labour.

The operation of the efficiency wage is illustrated in Diagram 1. The efficiency wage may be considered to be determined by a variety of factors, but an important element would be the level of the nutritional intake since work effort can be measured in terms of energy expenditure. In Diagram 1, we measure both effort and outcome in terms of energy units. There could be an institutionally determined minimum wage below which no labour supply would be forth-

coming. This minimum acceptable wage will determine the initial position of the effort curve. The origin and the shape of the effort curve will depend on the level of the offered wage. There is also an upper limit to the effort curve determined by physiological limits beyond which effort cannot be raised. At the lower wage rate the time devoted to heavy work will be less compared to a high wage situation. As one substitutes heavy work for light work the energy expenditure will rise at a faster rate. The effort curves drawn reflects these features.³⁸ E_1 and E_2 are the marginal effort curves corresponding to wage rates W_1 and W_2 . In the same diagram, we can also measure out-

put in terms of energy production, and corresponding to each effort level there will be an output curve as well.³⁹ O_1 and O_2 are the marginal output curves corresponding to E_1 and E_2 . Higher the level of effort, the larger will be the level of output. In a situation like that of Kerala's, the supply of labour will be infinitely elastic at the market wage rate. Even otherwise, in a Lewis-type economy, the labour supply will be highly elastic at the prevailing wage rate. This ensures the necessary conditions for the stability of the labour market: first, the condition that it is not necessary to offer a wage above the prevailing market rate and, secondly, the condition that the optimum effort will be forthcoming at that wage rate (as otherwise the employer would be free to substitute one worker with another). Therefore, the worker faces the threat of unemployment if he fails to put in his best effort. These are the reasons why the prevailing wage rate turns out exactly to be the efficiency wage rate. At this wage rate the employer will maximise his net output.

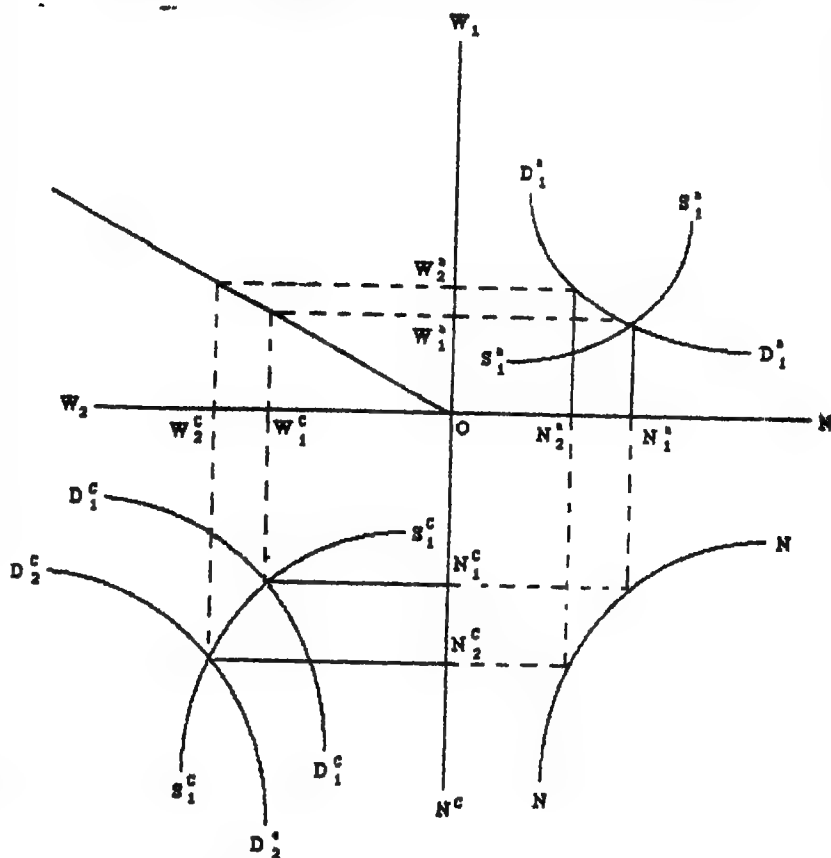

III

Wage Relativities and Changes in Product Demand

The low coefficients of variation and the mutual causal relationships among wage rates together do not imply that wage relativities are insensitive to conditions in the different product markets. A weakening of product demand will obviously lead to a weakening of the demand for labour too which in turn may widen the wage relativities. McDonald and Solow have shown that in a segmented labour market where there is flexibility of wage rates in the secondary labour market to accommodate all those who seek jobs in that sector, the wage differential between the primary and the secondary sector widens as the overall labour market weakens and vice versa.⁴⁰ They assume that the wage rate in the primary sector is rigid and it is changes in employment and not in wages which bring about the adjustment in this market.

The basic premise of our analysis differs fundamentally from the McDonald-Solow assumption in that the wage relativities are mutually related and are assumed to be stable. However, we also find that wage relativities widen as product demand weakens and narrows as product demand tightens. But because of the attempt to maintain the stability of wage relativities over the long-run, any widening of wage disparities is countered by attempts to regain the original parity levels. How soon the parity is restored will depend essentially on the conditions and characteristics of the particular labour market. Unionisation can be one instrument which can reduce the lag in the adjustment process and restore parities as quickly as possible. Another mechanism would be to appeal to custom and tradition in wage relationships as a reason for the restoration of parity whenever it is widely off the accepted norm. In the Kerala situation both these factors may be in operation.

DIAGRAM 3: EMPLOYMENT IN INTERRELATED LABOUR MARKETS

To repeat the point, this study analyses wages in the construction and agricultural sectors of the Kerala economy. Within agriculture, the most important commodity is rice and therefore the most significant wage rate is that of paddy field labour. An increase in construction activity or a rise in demand for construction labour will be reflected in a rise in wage rates in this sector, especially in the wages of masons and carpenters. We therefore estimated the ratio of paddy field labour to that of masons in order to analyse the movements in wage rates in relation to the changes in demand in the respective product markets.

What do the wage ratios indicate? The wage ratio for male agricultural workers rises from 0.62 in 1963-64 to 0.72 in 1974-75 and then declines to 0.57 in 1981-82. Thereafter it rises slowly and reaches a figure of 0.65 in 1988-89, close to the mean value. The wage rates of female agricultural workers are available only for the period 1973-74 to 1988-89 and the relative wage of female agricultural labour appears to have steadily deteriorated, from 0.49 to 0.38. Thus it appears that the brunt of the labour market adjustment in a weak product market is borne by female labour.

Table 9 provides data on wage relativities, on the farm harvest price of paddy and on the cost of living index for agricultural labourers in Kerala. While farm prices as well as the cost of living index have risen during the period of our analysis, there are some marked differences in their trends. The trends in harvest prices reflect more ac-

curately the total output in agriculture (and in drought years, harvest price increases are much higher than those in the cost of living index). Column 3 of Table 8 gives the ratio of the farm price index to that of cost of living, and shows that from 1968 to 1978 it was greater than one and that from 1979 this trend was somewhat reversed. Larger increases took place in farm harvest prices between 1966 and 1975 than in the subsequent period. A comparison of the annual percentage changes in wage relativities with those in farm harvest prices indicates that both move together. The wage relativities began to rise from 1966 until 1975 and, reflecting the decline in farm harvest prices, then started to move downward, reaching a low point in 1980-81. In Diagram 2 we have drawn the graphs of the annual percentage change in farm harvest price and also the corresponding percentage change in the wage ratio of male agricultural field labour. The directions of changes in both curves are similar except for the period 1987 to 1989 when the attempt to raise the wage parity succeeded quite to an extent.

The relationship between farm harvest price and the movements in relative wage in agriculture in Kerala is closely related to the food economy of India. Kerala was producing only about half of its rice requirements in the 1960s and depended for the rest of the requirements on the release of both rice and wheat from Central government stocks for public distribution. During this period there were also restrictions on the free movement of foodgrains within the country. The price

increases in the 1960s reflected the tight food situation in India, which limited the availability of foodgrains from the Central pool to Kerala. But this situation was somewhat eased by the beginning of the 1970s as a result of the introduction of the high-yielding varieties of wheat and rice. These are reflected in the changes in the net availability of foodgrains in Kerala, from 70.4 kgs per capita per annum in 1960-63 to 96.2 kgs in 1970-73.⁴¹

The food situation improved from the mid-1970s and the restrictions on grain movement were also relaxed to a large extent from then on. The farm harvest price within Kerala is basically influenced by the level of food output elsewhere in the country, since it determines the quantum of rice that is available to Kerala both through the public as well as through private trade. From the mid-1970s, the quantities of grain imported to Kerala from the rest of India began to rise; this played a dampening role on the extent to which farm prices could be raised. On the other hand, in the 1960s, when the domestic foodgrains market was not tightly integrated with the rest of the Indian foodgrains market, farm harvest prices could absorb the increases in agricultural wages without affecting the level of return on cultivation.

The behaviour of the wage ratios also confirms that upward revisions of wages are easily granted in a tight product market and less so in a weak product market. A general conclusion that seems to emerge from this analysis is that the relative wage moves in favour of the agricultural worker when the terms of trade moves in favour of agriculture, and the relative wage deteriorates when the terms of trade move against agriculture.

TABLE II: PERCENTAGE INCREASE OF AGRICULTURAL LABOURER (AL) HOUSEHOLDS AND OTHER AGRICULTURAL LABOURER (ORL) HOUSEHOLDS

| Period | Percentage Change of Households over 1964-65 | | |
|---------|--|-------|------------------|
| | AL | ORL | All Rural Labour |
| 1974-75 | 27.12 | 38.95 | 31.03 |
| 1983-84 | 9.26 | 69.45 | 30.35 |

TABLE 12: AVERAGE ANNUAL INCOME OF RURAL LABOUR HOUSEHOLDS (Rs in Current and 1960-61 Prices)

| Period | Agricultural Labour Households | | | | Non-Agricultural Labour Households | | | |
|---------|--------------------------------|-------------------|----------|-------------------|------------------------------------|-------------------|----------|-------------------|
| | Current | Percentage Change | Constant | Percentage Change | Current | Percentage Change | Constant | Percentage Change |
| 1964-65 | 835 | | 632 | | 916 | | 694 | |
| 1974-75 | 2068 | 147.6 | 540 | -14.55 | 2171 | 137.0 | 567 | -18.3 |
| 1983-84 | 4863 | 135.0 | 831 | 53.9 | 5440 | 150.6 | 930 | 64.0 |

In Table 9 we have also shown the gender differentials in wages. While the gender wage differentials between the construction and the agricultural sectors appear to have widened, this is less so within agriculture itself. Our earlier analysis of causality had indicated that wages of female agricultural labourers were not causally related to any other wage rates except to those of male agricultural labourers. In fact, while the sectoral wage differentials widened between 1975 and 1982, the gender wage differential within rice cultivation remained unchanged until 1984, and then widened considerably. On the other hand, the changes in differentials between paddy wages and the wage rates for other agricultural activities have narrowed for male workers and widened for female workers. Thus all the wage comparisons indicate that the decline in demand for labour for rice cultivation has had the greatest (adverse) impact on female wage rates in rice cultivation. Even though the gender wage differentials have widened in Kerala, female wage rates are still the second highest in the country. The Kerala wage rate is two and a half times as high as the female agricultural wage in the neighbouring State of Tamil Nadu (see Table 1).

The analysis of the relationship between wage relativities and product demand seems to indicate the following conclusions: the extent of changes in wage disparities depends not only on the position of the given category of labour in the wage hierarchy but also on the degree of interrelationship between the respective wage rates. The degree of interrelationship might be indicated by the magnitude of the wage elasticities which gives the value of the elasticity of wage of the j th category of labour with respect to the wage of the i th category of labour. When these elasticities have values exceeding zero we may describe the labour markets as interrelated and the categories of labour that have elasticities less than zero as segmented labour markets. The closer the value of the elasticity to unity, the less the deviation in the wage relativities from the long-term norm. The speed of adjustment may also be determined by the degree of interrelatedness of the labour markets. The weaker the interrelationship, the longer the lag in restoring the wage parities.

We had noted earlier that not only was female labour at the bottom of the hierarchical ladder, this market was also the least interrelated with other labour markets. The gender wage differential thus widened in a weak product market and there was probably a longer time lag in restoring the parity.

IV

Employment and Output in Interrelated Markets

An important characteristic of interrelated labour markets is that when the wage rate in any single labour market changes due to an autonomous factor, it will induce changes in wage rates in all interrelated labour markets. The extent of these induced wage changes will depend upon the strength of the degree of interrelatedness as indicated by the magnitude of the wage elasticities. How these induced wage changes affect output and employment would depend on the conditions prevailing in the product markets. If the product markets are tight, then wage increases can be passed on to the consumers through higher product prices. On the other hand, if wage rises appear to be difficult to be added to prices, then they may lead to a contraction in employment and output in those sectors where the wage increases are due to induced rather than autonomous changes. In that sector where an autonomous increase in demand led to a rise in wage rates, employment and output would rise too, but whether this would compensate for the decline in employment and output in the rest of the economy is a difficult proposition to answer without a more detailed macroeconomic model. However, we shall attempt a simple two-sector model to illustrate the relations described so far and then examine whether it is able to explain the recent performance of the Kerala economy. Since we are basically interested in the performance of the rural economy of Kerala, we assume that the two sectors are represented by building construction and agriculture.

A MODEL OF EMPLOYMENT AND OUTPUT IN INTERRELATED MARKETS

The mechanics and the operation of the two-sector model are illustrated in Diagram 3. It is divided into four quadrants, the upper right and the lower left quadrants depicting the labour market conditions in the agriculture and construction sectors respectively. The D_i^a , D_i^c and the S_i^a , S_i^c curves are the demand and supply curves for labour in the agriculture and construction sectors respectively. RO in the upper left quadrant represents the prevailing wage parity. The NN-curve on the lower right quadrant represents the employment frontier, giving the combinations of employment in each sector for different absolute wage rates while the relative wage remains stable.

The initial wage rates and the corresponding levels of employment are indicated by W_1^a , W_1^c and N_1^a , N_1^c . The slope of the relative wage curve shown in the upper left quadrant reflects the prevailing wage rates which are in conformity with the accepted social norm regarding wage rates for different categories of labour. Total employment in the economy will be the sum of ON_1^a and ON_1^c and the corresponding point is indicated in the employment curve shown in the fourth quadrant.

When the demand for labour rises in the construction sector due to an autonomous increase in investment in this sector it initiates an increase in the wage rates of construction labour. This increase begins with a rise in the wages of carpenters and masons. (This is because their supply is limited since these are caste-based occupations and free entry is restricted) This is precisely what happened in Kerala when the construction boom was initiated by the remittances of earnings from the workers of Kerala origin in West Asia. This internal shift in demand for construction labour was further reinforced by the migration of construction labour, especially of carpenters and masons, to West Asia. The initial rise in the wages of carpenters and masons was soon transmitted to the wage rates of unskilled labour in construction and in other inter-related labour markets through the operation of the parity norm.

The effect of the rise in construction investment is indicated in the diagram by the outward shift of the demand curve for labour. When the wage rate rises in the construction sector the agricultural wage also rises in order to keep the relative wage constant. However, this increase in agricultural wage will shift the demand for labour in this sector downwards. The extent of this shift will depend on the elasticity of demand for labour which, in turn, depends on the elasticity of product demand. This is essentially a question of whether or not farmers are able to pass on the wage increases to consumers or not. When this is not possible the rise in wage rate leads to a decline in employment and output in the agricultural sector. There will be a new level of aggregate employment which could be the same as before or lower, or higher, depending on the respective elasticities of labour demand in the two sectors. The original level of employment can be maintained in agriculture only if the relative wage declines.

EMPLOYMENT AND OUTPUT IN AGRICULTURE IN KERALA

We shall now examine whether the changes in employment and output in agriculture in Kerala are consistent with the conclusions of the model developed here. While statistics on acreage and output are available on an annual basis, we lack comparable information on employment. Whatever information we have on employment are either collected through the National Sample Survey or by the decennial Rural Labour Enquiries. The data collected by the latter indicate that the average number of days of employment has drastically declined in agriculture between 1964 and 1984. A male agricultural worker was employed on an average for 198 days in 1964-65. That figure declined to 169 days in 1974-75 and to 147 days in 1983-84. The corresponding decline was even larger for female workers, from 165 days to 115 days (see Table 10). Though the number of days of employment decreased in non-agricultural activities too, not only was the extent of the decline smaller but it fell from a larger

DIAGRAM 4: ACTUAL AND FITTED ACREAGE UNDER PADDY

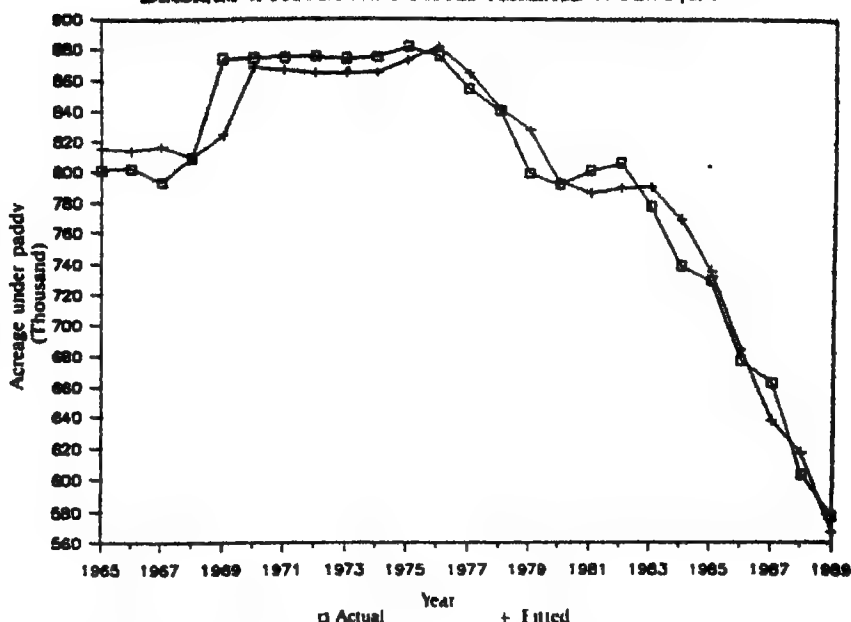

figure. The decline in employment in agriculture would have been much larger but for the fact that there occurred a shift of labour households from agricultural to non agricultural occupations (see Table 11). The changes in relative wages and the shift from agricultural to non agricultural occupations confirms that there was a marked increase in the demand for labour in non agricultural activities after 1974-75 when the impact of Gulf remittances began to be felt in the Kerala economy. What the combined effect would be of these factors on the quantum of aggregate employment in agriculture is a difficult question to answer, but the decline in acreage under paddy must surely result in corresponding decline in total employment also.

Interestingly, the decline in employment does not appear to have affected adversely the income of the labour households. The decline in the number of days of employment seems to have been compensated for by the rise in wage rates. While the extent of the rise in real income was smaller than the rise in real wage rates, real incomes still rose one and a half times for agricultural labour households and by nearly two thirds for non agricultural households between 1964 and 1984 (see Table 12).

If we can show that the rising level of wages was an important factor in the decline in the acreage under paddy cultivation then it would confirm the validity of our hypothesis and the relevance of the above model in explaining the performance of the agricultural economy of Kerala. For this purpose we estimated acreage response functions for paddy cultivation and the results are given in Table 14. Equations (1) and (2) are of a Nerlovian type of distributed lag where lagged values of acreage under paddy, farm price of paddy and male or female wage rates have been used as explanatory variables. In equation (3) we omitted lagged acreage from the explanatory variables, but introduced additional lagged values of price

and wage. In all cases the values of R^2 are high and all the three variables appear to be important in determining current acreage under paddy production. In all cases the coefficients display the correct sign and the levels of significance appear to be higher for wage rate than for price. In Diagram 4 we have compared the actual and the predicted acreage by equation (1) with male agricultural wage rate and it is clear that they lie very close to each other. Equation (3) also demonstrates that even if the lagged value of acreage is omitted the farm price and the wage rate explain quite adequately the variations in area under paddy. These estimates clearly establish that the level of agricultural wages has been a major factor in the reduction of area under paddy cultivation in Kerala.

Kannan and Pushpanadan⁴² point to the failure of growth in productivity to keep pace with the growth in wage rate as one of the causes for the decline in acreage under paddy. While this is an important factor, we need to ask the question what the factors are that have stood in the way of improvements in productivity. This question is particularly important in the context of Kerala because it is the only State in India which implemented a major land reform in the 1960s. By this reform the State not only abolished the prevailing pattern of tenancy but also prohibited any forms of tenancy in agriculture in the future. By this legislation all those cultivators who were tenants became owners of land overnight. The paradox of Kerala agriculture is that, contrary to expectations, both area and output started to decline after the implementation of the land reforms.

There are three factors that mitigate technological change in paddy cultivation in Kerala. The break-up of the joint family and the high growth of population in the State over a long period accelerated the process of partitioning of cultivable land resulting

in smaller and smaller size of average holdings. This fact is fully reflected in the size distribution of agricultural holdings in the State. In 1961-62, the average size of holdings owned by 87 per cent of rural households was less than 1.01 hectares and the area owned by them constituted 30 per cent of the total. 13.5 per cent of the total area belonged to 0.24 per cent of the households owning more than 10 hectares. By 1981-82, only 0.05 per cent had holdings above 10 hectares and the total area was only 1.59 per cent. On the other hand, 46 per cent of the total area was owned by 91 per cent of the rural households owning less than 1.01 hectares.⁴³ While these changes partly reflect the results of the implementation of the land reforms in the State, such small holdings are not economic for undertaking either major investments or for generating adequate income for the family. They would be viable only if they were to be cultivated by own family labour.

The second factor is that for a large proportion of the households who own land, agriculture is not their principal means of family income. Of the total number of households who own less than 2.5 acres of land, agriculture is the principal means of livelihood only for 57 per cent.⁴⁴ This group may be using more of family rather than of hired labour for cultivation. The decision to cultivate the land or not by the 43 per cent of the rest of the households would be strongly influenced by the level of wage rates as they may be employing wage labour for cultivation. The occupational data collected by the population censuses indicate that this shift from agriculture had already begun in the 1960s (although this was a period when the area under paddy cultivation rose). Cultivators as a class are on the decline in Kerala and this trend is most pronounced since 1971 (see Table 13). While higher agricultural wages obviously contributed to this phenomenon, this process could not have been as pronounced as it was without alternative avenues for earning incomes opening up for those households who opted out of agriculture. Such avenues were opened up by the flow of remittances from the West Asia to Kerala. It was pointed earlier in the paper that the amount of household consumer expenditure exceeded the State domestic product by 5 per cent. This increase in consumer expenditure promoted the expansion of trade, transport, banking and a host of other non-agricultural activities in the State and this expansion enabled the marginal cultivators to move out of agriculture. High levels of literacy and more years of schooling probably also helped this transition.

The third factor which might have contributed to the decline in area, output and employment in paddy cultivation has already been hinted upon earlier. In the context of the aggregate deficit in food in Kerala, the owning of paddy land was an insurance against unforeseen grain shortages and provided a secure source of grains for self consumption. Since 1977 the availability of rice and wheat through the public

distribution system as well as in the open market has improved; at the same time, the prices of these grains were also more or less stable. Households which had earlier cultivated for their own consumption found that they could purchase grain at a lower price than the cost they would have had to incur if they were to cultivate the land themselves.

UNIONISM AND WAGES

The existence of relatively high agricultural wages in Kerala compared to those of other States in India has been generally attributed to the unionisation of agricultural labour in Kerala.⁴⁵ Union activities were most strong in the two major rice producing regions, namely the Kuttanad region and Palghat district.⁴⁶ An examination of wage relativities suggests that the agricultural labour unions succeeded in pushing up their wages during the period 1965 to 1975. This period coincided with food shortages and high farm harvest prices. We have already indicated earlier that the wage relativities were narrower during this period. Unions might succeed in raising wages in a tight product market when the product prices are rising. At such a time, unions could argue that it was only fair that farmers share a part of their windfall gains with workers. In a weak product market this type of argument has no value. This explains why the wage relativities widened since 1976 when the farm harvest prices settled down to a lower level. However, agricultural workers are able to push up their wages by 1984 probably by appealing to parties and

again unionism might have aided in this revision. When the relative wage considerably worsens unions might argue that wage parities be brought back to the socially accepted norm whatever be the conditions in the product market.⁴⁷

Unions have certainly played an important role in improving the working conditions of labour in the State. While the agricultural labourers are unionised, the construction workers—skilled and unskilled—remain largely outside union organisation; but they too benefit from the actions of agricultural workers unions due to the importance attached for the adherence to wage norms.

V Conclusion

This paper has attempted an analysis of the relationships between wages, employment and output in the agricultural sector of the Kerala economy. The finding of this analysis is in contrast to Kerala's creditable performance in the social sectors such as education, health and family welfare.⁴⁸ The outstanding performance of the social sectors has been attributed to the success in providing public goods and making them accessible to most of Kerala's population. As a result, Kerala has now a life expectancy over 72 years for women, the infant mortality rate in the rural sector is close to 27 per 1000 live births, has a birth rate of around 22 per 1000 population and the rate of population growth has declined to about 1.5 per cent per annum. These achievements are,

no doubt, the result of a number of equitable social and economic policies that have been pursued in this State for a considerable length of time. Now the time has come to ask the question: Can Kerala sustain this pattern of development? The answer to this question, I am afraid, may be a negative one unless Kerala is able to initiate and sustain a high growth rate of its economy. Since mid-seventies, the Kerala economy's buoyancy is solely due to remittances from the Gulf countries.⁴⁹ Any reversal in the fortunes of Kerala workers in this region will have disastrous consequences for Kerala.

This study is an attempt to identify some of the factors hindering the growth of the economy. The high wage rate in the economy has been an important factor at least in the poor performance of the agricultural sector in Kerala. The bio-technological and institutional innovations necessary to sustain a high wage rate in agriculture were totally ignored in its agricultural development programmes. While Kerala succeeded to a very large extent in developing and implementing a rather coherent and integrated social development programme, it appears from this analysis that it has not done so in the field of economic growth.

Notes

[This paper forms part of a larger study on "Labour, Economy and the State in Kerala". I thank Lincoln Chen and the members of the Harvard Centre for Population and Development Studies for providing me their facilities in a stimulating environment to complete the drafting of this paper. This paper is No 5 of their Working Paper Series. I am grateful to Joan Mencher, V K Ramachandran, Madhura Swaminathan and Grace Wyshak for their detailed comments and suggestions on an earlier draft of this paper. I am also thankful to Nevin S Scrimshaw and T N Srinivasan for their suggestions on specific questions. I still retain full responsibility for all errors and interpretations. I am thankful to S Mohana Kumar for his diligent and conscientious research assistance throughout the preparation of this paper and to A K Shiva Kumar and Laura Reichenbach for their assistance.]

- 1 Some of the most interesting recent literature on labour market behaviour in developed countries are by Richard Freeman (1990), Assar Lindbeck and Snower (1989), Lawrence Summers (1990) and Robert Solow (1990). The literature on developing economies is summarised by Hollis Chenery and T N Srinivasan (1989) and in Hans Binswanger and Mark Rosenzweig (1984).
- 2 See Amit Bhaduri (1973) and Pranab Bardhan and Ashok Rudra (1986) and Pranab Bardhan (1984). Mohan Rao (1988) has provided a useful review of this literature. Another review is by Krishna Bharadwaj (1988). Bliss and Stern (1982) has a discussion of the theoretical literature on the efficiency-wage hypothesis and an investigation of inter-linkages at the village level.
- 3 The idea of dual labour market is implicit in Arthur Lewis' (1954) model on "unlimited supplies of labour". Peter Doerger and Michael Piore (1972) employ the concept of dual labour markets in the context of developed economies.
- 4 Ramachandran (1990), "Manual labour is the only alternative occupation open to the propertyless and the uprooted in the village,

to those who lose their land, and to those for whose traditional trade, craft, or service the demand is dead or dying", p 90.

- 5 Wage rates are not solely determined in the same manner as prices or commodities and that social custom might be important in their determination have been espoused, among others, by John Hicks (1955), Phelps-Brown (1971) and Robert Solow (1980, 1990). "More precisely, I suspect that the labour market is a little different from other markets, in the sense that the objectives of the participants are not always the ones we normally impute to economic agents, and some of the constraints by which they feel themselves bound are not always the conventional constraints. In other words, I think that among the reasons why market-clearing wage rates do not establish themselves easily and adjust quickly to changing conditions are some that could be described as social conventions, or principles of appropriate behaviour, whose source is not entirely individualistic" (Solow, 1980, p 3).

- 24 Within year coefficients of variation were even smaller than between year coefficients of variation.
- 25 McDonald and Solow (1985) and the various articles in Akerlof and Janet Yellin (1986).
- 26 A study that attaches great significance to relativities in pay determination is by Adrian Wood (1978). This study does not appear to have received the attention it deserves.
- 27 V K Ramachandran (1990) states, "looking at the overall access of persons of different castes to different occupations... the results are clear:
 - the occupations that were least caste-heterogeneous were artisan and traditional activities (there are long-standing social barriers to entering these sunset activities);
 - the next was the category of landlords (there are, *inter alia*, formidable economic barriers here); and
 - the most caste-heterogeneous class of all was that of agricultural labourers: agricultural labour is the greatest leveller of castes in the village", p 71.
 See also Bopagamage and R N Kulahalli (1971).
- 28 There is a growing literature in sociology on labour market behaviour that attaches great importance to perceived social norms and the role of status. For instance, see W G Runciman (1966) and Jon Elster (1989).
- 29 See Akerlof (1980) who discusses social custom and the role of social stigma in a different context to explain the persistence of unemployment.
- 30 See K P Kannan (1988).
- 31 The Government of Kerala periodically announces the revision of wage rates to take into account the changes in cost of living. The government also appoints committees to work out minimum wages at irregular intervals.
- 32 Report of the Minimum Wages Committee (1956), p 5, para 10.
- 33 Ibid, p 13, "The Committee has given serious thought to the several concepts of 'minimum wage' and agreed that the minimum wages in agricultural employments, should have the structure and contents of a 'fair wage'".
- 34 The idea of 'fair wages', is very old in the literature. It has become an important analytical base in recent literature in explaining trade union behaviour. See Peter Swenson (1989).
- 35 The following observation of J R Hicks (1955) is of great interest in this context:

"It has never been the general rule that wage rates have been determined simply and solely to supply and demand. Even on pure grounds of efficiency it is desirable that the wage which is offered should be acceptable, acceptable both to the worker himself and to those with whom he is to work. There has in consequence always been room for wages to be influenced by non-economic forces—whether by custom (which economically speaking, means supply and demand of the day before yesterday), or by any other principle which affects what the parties to the wage-bargain think to be *just* or *right*. Economic forces do affect wages, but only when they are strong enough to overcome these *social* forces", p 390.
- 36 See Ramachandran (1990) on methods of recruitment pp 196-198. He states, "The village labour market is also characterised by very high levels of unemployment. In

such circumstances, the burden of finding a job falls squarely on the worker. The employer does not have to search for a labour force as such, his task involves employing the best possible workers, employing them on time, and deploying their labour efficiently", pp 197-198.

An important consideration in this context is the durability of the relationship Hicks (1974) emphasises this aspect thus "There is a distinction which I made, long ago, in my 1932 book on *Wages* from which I may begin. It is the distinction between casual employment, the single job employing no durable relationship, and regular employment, in which people work together and go on working together. Now it is necessary, purely on grounds of efficiency, in regular employment, that both parties, employer and employed should be able to look forward to some durability in their relationship. Yet if the worker is to be free to move (and if he is not free to move it is semi-slavery) there can be no such reliability unless there is contentment, or at least some degree of contentment. So it is necessary for efficiency that the wage-contract should be felt by both parties but especially by the worker, to be fair", p 64.

There is considerable literature on nutritional intake, work effort and productivity. See Nevin S Scrimshaw (1987) for the citations on this topic. Also Spurr (1984), Immink and et al (1984) and Nevin Scrimshaw and M Behar (1976).

The wage productivity relationship via nutrition was first developed by Leibenstein (1957) in the context of poor agrarian economies. A V Jose (1988) found that productivity was an important factor in explaining the inter-state variation in agricultural wages. In a regression, he uses productivity as an independent variable. Our approach suggests that the wage productivity relationship involves simultaneity but Jose fails to take this into account.

The theoretical relationship between wage relativities and product demand is analysed in detail in McDonald and Solow (1985). See paper by N Krishnaji (1988).

In our analysis, we have not considered crop substitutions arising from changes in relative prices within agriculture. Kannan and Pushpangadan (1988) have decomposed the growth in productivity separately for food and non food crops taking into account the growth in wage rates. National Sample Survey, Sarvekshana (1987).

National Sample Survey (1988).

Sex in the Empire

Gautam Sen

Empire and Sexuality: The British Experience by Ronald Hyam; Manchester University Press, 1990; pp IX + 234, £ 35.00.

RONALD HYAM's study combines insight and latent (and not-so-latent) prejudice in a nostalgic account of sexual mores and practices in the British empire and its resonance in domestic opinion and events. These are issues which enduring prudery, and reductionism and economism in the social sciences have conspired to obscure. This has seriously understated the range and complexity of motivation in human conduct, satisfying, paradoxically, one aspect of this motivation itself: sexuality and apprehension of it.

Largely hidden from the 'intersubjective' discourse is the place of sexuality, in the fully, fleshed out (so to speak) story of imperial conquest. Along with booty, pillage and murder, conquerors have shown a universal and immediate interest in the women of the conquered people. The women of the losing side provide, in addition to labour, sexual services,¹ initially through rape and abduction and then through adaptive institutionalisation to create a sustainable *modus vivendi* in parallel with other longer term colonial and imperial relationships: "The evidence of the pervasive significance of prostitution for the British Indian army alerts the historian to what may be a central feature of the expansion of Europe as a whole... as much a system of prostitution networks as it was (in Kipling's famous phrase) a web of submarine cables" (pp 133 and 212).

Hyam is dismissive of feminist analyses in offering explanation for sexuality in the empire, except at a high and thoroughly opaque level of abstraction, at best, or as a form of unilluminating blanket condemnation. He quotes the sheer implausibility of Susan Brownmiller's generalisation about all men at all times which substitutes rage for cold analysis. But Hyam then proceeds to tell a story that easily provokes anger, a story of cynical exploitation of non-European women by white men. It is also exceptional, contrary to Hyam's conviction, for feminists to assert that lesbian love is the only legitimate sexual relationship (p 17). Where feminist analysis fails is not in its justifiable outrage but in oversimplifying. American (the bulk) and European feminist analysis, to which many Third World feminists pay obeisance in the same way Third World Marxists do to their inviolable imported texts, suffers from the ethnocentric arrogance of its origins, denying the legitimacy of other societies, except as backward objects of inquiry awaiting their intellectual and political attention. On the question of sexual interaction in the empire between the

conquerors and subject people the missing link is race, a feature which Hyam recognises as an explanatory factor but does not integrate in the detailed analysis. The feminist view of race is distinguished chiefly by its banality, just as Hyam's nostalgia about empire makes him predictable in another way. The notion of serious conflicts of interest between subject peoples and their masters is left only to the reader's imagination, Hyam reserves his own for the minutiae of sexual behaviour. This is a story for the boys.

Another issue addressed by Hyam is the causes of prostitution in general and its scale in the empire in particular. Hyam is sceptical of the view that poverty is a significant reason although he accepts the fact that it is undoubtedly a permissive factor. He then proceeds to make the extraordinary claim that the prevalence of child prostitution refutes economic causation (p 137)! I fear this inference is only revealing of authorial prejudices. I would have thought that the deployment of children as vehicles for sexual gratification (as in the contemporary Philippines) leads to money changing hands and it is the one type of 'prostitution' (a misnomer since it lacks the possibility of adult voluntarism) which is eminently of an economic character. However, be that as it may, it is possible to conclude that the explanation for prostitution is in fact basically economic, but the exact process is both surprisingly simple and also contrary to the poverty/economic equation frequently posited. The latter obfuscation arises because a market for human intimacy challenges fundamental notions about society and women (especially) and it provides, in addition, an agreeably progressive and transitory cause.

There are many immediate causes for the extent and types of prostitution but, as Hyam correctly points out, since it has always existed in time and space and at every level of society, it cannot be poverty alone that drives women to it. The only other conventional reason can be coercion (many prostitutes disagree) and patriarchy, the weakness of which as an explanation is its apparent ability to explain an excessively large number of diverse phenomena. Without rejecting the relevance of power in social relationships altogether because patriarchy could still be regarded as informing if not accounting for prostitution, it is necessary to ask a different question. The fact that female prostitution exists can, given its immense longevity, be regarded as a not very interesting tendency for markets to form in virtually all things in response to demand,

the elevated capacity for human love, freely given, etc, notwithstanding. The attempt to restrict prostitution expresses itself in higher prices rather than superior moral conduct.

The significant question then is the absence of similar markets for male heterosexual prostitution. The fundamental answer is a basic mismatch in supply and demand, i.e., there is an excess supply of sexually available males and an obverse shortage of females. According to Kinsey, "...only about two per cent of men are not interested in sex, the proportion of women with a weak response is nearer thirty per cent" (quoted by Hyam, p 7 and fn 24). The exact causes of this phenomenon and its durability are not material to explaining why men are seeking to buy and/or coerce sex from women, children and other men. Such an underlying explanatory factor does not preclude the potency of subsidiary historical and contingent reasons, including imperial dominance (see, for example, p 172) and the exercise of power in general, poverty and even individual career preferences. The history of sexuality in the empire is primarily about prostitution and in a situation where markets (indeed most markets) operate in the shadow of imperial political and military power rather than the mundane forces of supply and demand alone.

Hyam's study gives wide coverage of the British empire, in India and Africa and elsewhere, often unashamedly drawing attention to taboos and taboo subjects. His comment on the self-limiting nature of concubinage in Africa, "since African women were mostly unattractive to look at" highlights a brutal and widely-held prejudice (p 177). He also interweaves the analysis of the sex life of empire with sexual behaviour at home in Britain and changing moral codes. Hyam's approval of sexual licence in the empire (exclusively between white men and non European women) is fully reflected in a converse distaste for the so-called Purity Campaign, launched in Britain in 1869. Some of the aversion to the latter is understandable if merely because the ethnocentrism of its presumptions was unselective in intent if not practice. But Hyam extends his reflective distance to describing the medically and psychologically devastating practice of clitoridectomy in Kenya on pragmatic grounds: because "the outcome of the confrontation over clitoridectomy was a sharp reminder to the pretensions of Protestant missionaries that the customary sexual order in Africa was not lightly to be interfered with, still less derided" (p 196). The missionary view that the practice was not dissimilar to the Hindu custom of suttee was less "quixotic" (pp 191 and 196) than Hyam's relativism in "approving" the sexual opportunities provided by empire.

The account of the sexual activities of empire builders from the time of Clive of India and Clive himself was one of virtually

unlimited opportunity and an inexhaustible supply of women of empire, suggesting more than mutual attraction, unless the widely held view that non-European women are over-sexed proves accurate. Builders of empire, from Clive down to the commonest soldier, from India and China to the Hudson Bay Company, indulged every possible sexual whim, sometimes through marriage but more generally through mass prostitution and concubinage. The easy taking and discarding of concubines, making real the ultimate male fantasy of sexual paradise. To be an attractive Asian or African boy, even a rather small one, was also unsafe. But if the imperious British male had any preferences, it was to beget with a white woman, fuck with an Asian female (have her keep house) and sodomise Pathan boys when possible. The empire was sexual opportunity itself for the individual as much as booty for the mother country: "The girls were cheap and sensuous. If the army had any doubts about their cleanliness, then an officer could burn their huts and restock with Japanese" (p 108).

The authorities, when not themselves involved in the fray, were concerned about VD (that is among the soldiery) and opinion at home, which from the 1870s increasingly sought to ensure racial purity and social distance for an endangered imperial race of rulers. The obsession with sexual behaviour in Britain itself, especially the licentiousness of the working class (and the widespread prevalence of incest) arose partly from fears provoked by the poor condition of army recruits. It was this anxiety which spilled over into empire. Already by the 1790s mixed marriage had been ended by Cornwallis in India and social distance was further entrenched by Wellesley in the aftermath of the tremors of rebellion in the French San Domingo and execution of all whites by the mulatto Dessalines (pp 116-7). But sodomy and concubines continued to flourish. It was the arrival of wives that finally put an end to the native mistress. By the early twentieth century, the Smuts' purge of prostitution in South Africa began the "reversal of the trend towards turning the whole world into the white man's brothel..." (p 148). The memsahib has, in fact, been wrongly credited with causing the downfall of empire by some by "...making it impossible to meet Indians as friends" (p 119). Protecting the memsahib from the threat, however remote, of the black male was an imperative (see p 106 for evidence of the contrary situation in actuality).

It is this issue which Hyam addresses in the conclusion to his rich, sometimes perverse, study of sex in the empire: "one thing is certain. Sex is at the very heart of racism... there are many other factors but the peculiarly emotional hostility towards black men which it has so often engendered requires a sexual explanation. From New Orleans to New Guinea, from Barbados to Bulawayo, from Kimberley to Kuala Lumpur, the quintessential taboo to be explained is the white man's formal objection to intimacy

VAM ORGANIC CHEMICALS LTD.

NOTICE

We hereby notify for the information of the public that Vam Organic Chemicals Limited proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under Sub-Section (2) of section 92 of the Monopolies and Restrictive Trade Practices Act, 1969, for the approval to the establishment for a new undertaking/unit/division. Brief particulars of the proposal are as under:

- 1 Name and Address of the Applicant:
Vam Organic Chemicals Ltd.,
3rd Floor, Skyline House,
85 Nehru Place, NEW DELHI - 110 019.
- 2 Capital structure of the applicant:

| | (Rs. in lakh) | |
|--------------------------|---------------|------------|
| | Equity | Preference |
| a) Authorised | 1460.00 | 40.00 |
| b) Issued and Subscribed | 516.42 | 38.50 |
| c) Paid up | 516.26 | 38.50 |
3. Management structure of the applicant organisation indicating the names of directors including managing director/wholetime director and manager, if any:
The company is managed by the Board of Directors consisting of

| | |
|---------------------------|----------------------|
| 1. Shri M.L. Bhartia | — Chairman |
| 2. Shri S.S. Bhartia | — Managing Director |
| 3. Shri H.S. Bhartia | — Wholetime Director |
| 4. Shri U.S. Bhartia | — Director |
| 5. Shri A.S. Bhartia | — Director |
| 6. Shri Arbinday Ray | — Director |
| 7. Shri P.K. Khaitan | — Director |
| 8. Shri S.S. Kanoria | — Director |
| 9. Shri J.B. Dadachanji | — Director |
| 10. Shri R.K. Bhargava | — Director |
| 11. Shri Sunanda Prasad | — Director |
| 12. Shri Lalit Srivastava | — Director |
4. Indicate whether the proposal relates to establishment of a new undertaking or a new unit/division
A division
5. Location of the new undertaking/unit/division
Bharthana, Etawah Distt. U.P.
6. Capital structure of the proposed undertaking
As mentioned in Sr. No 2.
7. In case the proposal relates to the production, storage, distribution, marketing or control of any goods/articles, indicate

| | |
|----------------------------------|-----------------------------------|
| (i) Name of goods/article | Ethylene Vinyl Acetate Copolymers |
| (ii) Estimated licensed capacity | 6000 TPA |
| (iii) Estimated annual turnover | Rs. 30 Crore at full capacity |
8. In case the proposal relates to the provision of any service, state the volume of activity in terms of annual measures such as value, income, turnover, etc.
Not Applicable
9. Cost of project
Rs. 110 Crore
10. Scheme of finance, indicating the amounts to be raised from each source.

| | |
|--------------------------------|------------------|
| Internal Accruals | Rs. 27,50,00,000 |
| External Commercial Borrowings | Rs. 25,00,00,000 |
| Debentures | Rs. 28,75,00,000 |
| Term Loans/Supplier Credits | Rs. 28,75,00,000 |

We also notify for the information of the public that the location of the new division has been changed from Tehsil Kashipur, Distt. Nainital, State U.P. to Tehsil Bharthana, Distt. Etawah, State U.P.

Any person interested in the matter may make a representation in quadruplicate, to the Secretary, Department of Company Affairs, Government of India, Shastri Bhawan, New Delhi, within 14 days of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

For VAM ORGANIC CHEMICALS LIMITED

(Sd/-)

(S.S. Bhartia)

MANAGING DIRECTOR

Dated 27.6.1991

between black men and white women" (p 203).² It is with this deep-seated anxiety that modern feminism has found an unspoken resonance in the contemporary hysteria over the black rapist and mugger and the religious fanatic. The social powerlessness of the black male³ in racist white society is accurately reflected in hostility towards his sexuality, provoking, in turn, abandonment by women of his own community, to which his violently conservative reaction corresponds. The attendant counterpart feminist urge to liberate the black woman finds a historical echo of white male interest in the 'pretty ethnic', now the rage in men's magazines. In the words of Magistrate Samuel Sneade Brown of the 1830s ICS, the native woman: "...so amusingly playful, so

anxious to oblige and please, that a person after being accustomed to their society shrinks from the idea of encountering the whims or yielding to the fancies of an Englishwoman" (quoted in Hyam p 117). Marxist opinion on racism still finds itself rabbiting on unstopably about class oppression.

Notes

1 Plus reproductive roles in some circumstances; also see pp 160-61, 171-79 and *passim*.

2 Also see p 216, footnote 7.

3 This powerlessness extends from complete loss of control over his own sexuality (and family life) under slavery, to the role of catamite in conditions of socio-economic subordination (also see p 98).

West's Unacknowledged Debt

Burjor Avari

The Crest of the Peacock: Non-Western Roots of Mathematics by George Gheverghese Joseph; I B Tauris, London, 1991.

WE live in an age dominated by the scientific and technical ideas of the West. In every corner of the globe wise men and women pay homage to the intellectual superiority of the West. It is the dream of every aspiring and ambitious student in the so-called Third World to travel to places such as the US, Britain and Germany in order to learn more techniques and skills. The West has come to be accepted as the unchallenged possessor of the secrets of science. It is the place where pilgrims, in search of secular knowledge, come to learn the mysteries of physics, mathematics, engineering, micro-computers and a host of other sciences.

It was not always like that, however. Until just two centuries ago the West was a net importer of ideas rather than the giver. Some of the most creative concepts came from places which were far away from the West. Unfortunately this has all been forgotten in the last two hundred years. The world-wide domination of the West, the unparalleled prosperity the West came to achieve and the sheer pressure that the events of Western history came to exert over the course of world history—all these forces obliterated accurate knowledge about the history of ideas and their transfer. No one bothered to remember or acknowledge the intellectual debts of the West. Western scholars were quite prepared to bask in the notion that they were the inheritors of some unique and superior wisdom, a wisdom whose roots they traced back to classical Greece and to the Greek genius, and non-Western scholars either rested content in the ignorance of their own heritage or were too much under the thrall of the glitter of the West to seriously challenge the West's understanding of intellectual history.

Now things are beginning to improve, however slightly. The UNESCO, for example, has taken a lead in presenting to the intellectual world hitherto unacknowledged

evidence about the unique African heritage; many specialist institutions are promoting an understanding of the movement of ideas and, through the efforts of distinguished Western scientists like Joseph Needham of Cambridge, a more balanced evaluation of the non-Western contributions in science, such as those of China, is beginning to take place. The real successes will only be scored when the intellectuals of the non-Western world begin to take their heritage more seriously and embark on systematic researches.

It may be that the non-Western intellectuals will have to have a long acquaintance with the West before they are sufficiently aroused to look into the hidden by-ways of the history of ideas. George Gheverghese Joseph is one such person who has just published a path-breaking book on the history of mathematical ideas and their transmission. Born in Kerala, incidentally a great centre of Indian mathematical wisdom, although hardly thought of as such in the West, and brought up in Kenya, George Joseph acquired his higher education in the West and has worked at Manchester University since the 1960s. He is at home both with the history of mathematics and modern mathematics, and that makes his book convincing and credible.

In the book *The Crest of the Peacock* (the title is taken from an ancient Indian aphorism dating back to 500 years before Christ) Joseph takes us through a grand historical tour of mathematics in the non-Western world. He starts with some of the earliest mathematical notions from equatorial Africa and South and Central America. He then moves on to discuss the critical contributions of Egypt and Mesopotamia to Greek mathematics. Next he looks at some of the highly original mathematical thinking from China and

India; and finally he sums up the Arab contribution to the making of modern mathematics. Through all the countries that he takes us he provides a fascinating list of real and original examples and problems, with their solutions, from each mathematical tradition. After reading only a part of this book and taking note of all the forgotten non-Western mathematicians, along with the scholarly references that Joseph cites, one is both angry and perplexed as to why so little of non-Western mathematical tradition is known by the educated public both inside and outside the West. Could it be that the powerful custodians of the Western scholarly establishment prevent it from being known too widely, in case the entire historical rationale at the heart of the notions of Western intellectual supremacy is threatened by an alternative view of the history of ideas? One senses that Joseph has certainly, understood and grasped the significance of the marked reluctance and evasiveness of Western scholars in acknowledging their intellectual debts.

In perhaps the most important chapter of the whole book, the very first one, which is called 'The History of Mathematics: Alternative Perspectives', Joseph touches the heart of the matter when he explains the mathematical signposts and transmissions across the ages through the means of trajectories. The classic Eurocentric trajectory, dealing with mathematical heritage, is that which sees Greece as the fountain of all wisdom and which then traces the course of this wisdom through such vicissitudes as the Dark Ages and then flourishing through the Renaissance into the sunlit plains of modern European intellectual history. An amended version of this trajectory would acknowledge, only marginally, the inputs of Egypt and Mesopotamia and the role of the Arabs as preservers, storers and translators of Greek mathematical texts during the Dark Ages. Joseph convincingly demolishes the case for both the classic Eurocentric trajectory and its amended version. Instead, he proposes his own multinational, multi-cultural trajectory, in which mathematical knowledge and heritage pass on in history through the filter of many lands and peoples. Under this scenario, the modern West received the best of the mathematical ideas of India, China, Greece, the Hellenistic world, etc, only through the efforts of intellectuals and thinkers who lived in such cities as Jund-i-Shapur in Sassanian Iran, Baghdad of the Abbasid Caliphate, Fatimid Cairo, and Cordova and Toledo in Muslim Spain.

Joseph's historical analysis is convincing not least because of the meticulous care he has taken over the veracity of his evidence and data. His clear and rational unearthing of intellectual history of mathematics must be considered as the only approach that will remotely have a chance of successfully challenging the entire fortification built around the legitimacy of Western intellectual triumphalism.

INSTITUTE FOR SOCIAL AND ECONOMIC CHANGE
Nagarabhavi P O

Bangalore 560 072

Advt. No. I/18.246

Applications are invited for the following posts:

1. Professor of Sociology (One)
2. Professor of Economics (One)
3. Professor of Development Administration (One)
4. Associate Professor of Sociology (One) (Reserved for SC/ST)
5. Project Director (Equivalent to the post of Professor) (One)

for the Project on "Beneficiary Assessment of the National Sericulture Project". The post is temporary upto 31.3.94

ESSENTIAL QUALIFICATIONS:

- Post 1:** a) Master's Degree in Sociology with minimum 50 per cent marks in the aggregate.
b) Ph D or published work of equivalent standard in Sociology.
c) 10 years research and/or teaching experience in the subject.
d) Publications in the subject.
- Post 2:** a) Master's Degree in Economics/Rural Economics/Agricultural Economics with 50% marks in the aggregate.
b) Ph D or published work of equivalent standard in Economics.
c) 10 years teaching and/or research experience in Rural Economics/Agricultural Economics
d) Publications in the field of Rural Economics/Agricultural Economics.
- Post 3:** a) Master's degree in Political Science/Public Administration/Development Administration with 50% marks in the aggregate.
b) Ph D or published work of equivalent standard in Political Science/Public Administration/Development Administration.
c) 10 years teaching and/or research experience in the subject.
d) Publications in the subject.
- Post 4:** a) Master's Degree in Sociology with minimum 50% marks in the aggregate.
b) Ph D or published work of equivalent standard in Sociology.
c) 5 years research and/or teaching experience in the subject.
d) Publications in the subject.
- Post 5:** a) Master's Degree in Sociology/Anthropology with 50% marks in the aggregate.
b) Ph D or published work of equivalent standard in the subject.
c) 10 years teaching at post-graduate level and/or research experience in the subject.
d) Publications in the subject.

DESIRABLE QUALIFICATIONS:

- Post 1:** Knowledge and experience in conducting, co-ordinating and organising field work and research surveys, preferably on the themes of rural India.
- Post 2:** Knowledge of Quantitative Methods with special reference to Rural/Agricultural Economics.
- Post 3:** Knowledge and experience of conducting, co-ordinating and organising field studies.
- Post 4:** Experience in conducting policy-oriented research and knowledge of Statistics for collecting, analysing and interpreting data for research.
- Post 5:** a) Experience in directing research projects independently.
b) Experience in collection of qualitative data and good knowledge of research methodology.
c) Experience in processing of data and report writing.
d) Knowledge of at least one language of the research area, viz , Kannada, Tamil and Telugu.

- NOTE:** 1) Applications should be accompanied by a copy of at least 3 publications.
2) Candidates who had applied earlier for post of Professor of Sociology (vide Advt. No. I/18.243) need not apply again.

AGE LIMIT: Normally below 50 years in the case of Professor, and 40 years in the case of Associate Professor. Age is relaxable upto 5 years in the case of SC/ST/BC/BT candidates and without any limit in the case of employees of the Institute.

SCALES OF PAY 1. Professor: Rs 4500-150-5700-200-7300
2. Associate Professor: Rs 3700-125-4700-150-5300

GROSS EMOLUMENTS IN THE MINIMUM OF THE SCALE:

1. Professor: Rs 6,691/-
2. Associate Professor: Rs. 5,877/-

The Selection Committee may relax qualifications in exceptional cases and can also consider suitable candidates from outside the list of applicants. Higher start may be given in deserving cases according to rules.

Application form and a copy of this advertisement can be had from the Registrar by sending a postal order/DD for Rs 15/- for the posts 1, 2, 3 and 5 with a self-addressed stamped (Rs. 2/-) envelope (28x11 cms). No postal order required for SC/ST candidates; they should send their requisition with an attested copy of the caste certificate along with a stamped envelope (Rs 2/-). Completed application should reach the REGISTRAR on or before AUGUST 14, 1991.

REGISTRAR

Ramamurti Report on Education in Retrospect

Amrik Singh

In May 1990 the National Front government appointed a committee under Acharya Ramamurti to go into the distortions in the country's educational system. The committee's report outlines its principal concerns as equity and social justice, decentralisation of educational management, establishment of a participative social order, inculcation of enlightened and humane values and empowerment for work. This paper undertakes a detailed evaluation of the contents of the report.

I

PERHAPS no other report on education since 1947 has had the same series of mishaps as the Ramamurti Report has had. The committee was appointed in May 1990 in pursuance of a pledge by the National Front (NF) in its election manifesto that the educational policy would be reviewed. The said manifesto talked of abolishing capitation fee and other distortions in education. But what it specified in particular was the 'elitist aberrations' in the educational system.

Properly speaking, such a committee should have been appointed soon after the NF government took over in December 1989. But something odd happened. The prime minister did not appoint anyone to the department of education, not even a minister of state, to look after the portfolio. Questions in parliament were answered by the minister of state for science and technology and that is how things carried on for the first four to five months.

One of the first things that the new minister of state, when appointed, did was to appoint a committee under the chairmanship of Acharya Ramamurti, a well known Gandhian and social activist. The other members of this committee were half a dozen vice-chancellors, an ex-vice-chairman of the UGC, a few academics including a retired college principal and only three persons connected with primary or elementary education. The additional secretary of the department of education was appointed as the member-secretary.

There was something odd about the choice of the members. Not many of them had first-hand knowledge of the school system whereas the starting point of the review was what came to be described as the 'elitist aberrations'. As it turned out, only a couple of members devoted time and attention to the task in hand; the rest only attended meetings which were not all that many. The bulk of the job was done by a couple of members and the member-secretary and his staff. Whether what the latter did was two-thirds or three-fourths of the total job is a matter of opinion. As far as the members were concerned, at least one of them confessed to the writer of this paper that he had not read the full report even after

publication.

There were two reasons for this somewhat unusual state of affairs. One, the committee's terms of reference were to review the 'National Policy on Education, 1986 and Its Implementation'. In a sense thus, the parameters were set by what the 1986 policy had laid down. As a corollary, it was also to suggest revision of the policy within a given time frame. This in turn leads to the second point.

In September, 1990, that is to say about four months later, the committee put out a discussion paper entitled 'Towards an Enlightened and Humane Society'. It was circulated so as to provoke some discussion. By the time the reactions came in and began to fall into some kind of a pattern, the country was overtaken by political instability and, in early November, the V P Singh government which had appointed the Ramamurti Committee fell.

One consequence was obvious. No one knew if the Ramamurti Committee (whatever it recommended) would be taken seriously by the new government. Strictly speaking, such a thing ought not to happen but then it did happen. As if this was not unsettling enough, the new minister of state for education made it known in no uncertain terms that he was in favour of the Navodaya Schools.

To review their status and working had been more or less the starting point of the appointment of the Ramamurti Committee. For a few weeks thus the country witnessed a curious spectacle. The new minister of education lost no opportunity to make it known that as far as this particular issue was concerned his mind was already made up. Whatever interest or enthusiasm the members of the committee had in the first instance now began to wane.

Nobody in the government took the position that events had overtaken the Ramamurti Committee and that it could be wound up or anything of that kind. On the contrary, its mandate was renewed. In practice however, apart from one or two members who were keen to complete the job, most of them lost interest in whatever was happening. It is in this light that the statement made earlier should be seen. The secretariat did

not wish to leave the job unfinished and therefore it persisted and worked under enormous pressure and finalised the report by the due date. The whole committee came together to spend some time looking it over but did not carry out any real changes.

II

In a brief chapter of five pages entitled 'Approach' the committee has described its principal concerns as follows:

- equity and social justice.
- decentralisation of educational management at all levels
- establishment of a participative social order.
- inculcation of values indispensable for creation of an enlightened and human(e) society.
- empowerment for work.

Having enumerated them, the committee is forthright enough to say that education has to be viewed in the overall context of social, economic, regional and gender-based disparities. For example, any emphasis on vocationalising education would carry no meaning unless, concurrently, the government were also to lay down an appropriate income and wages policy. Likewise, policies concerning removal of economic disparities such as for land reforms, employment, health and nutrition, etc, would have to be concurrently established/reviewed. This is both honest and realistic.

What the committee does not say but could have said was that unless the whole strategy of development is remodelled, secondary concerns like education can achieve only limited ends. All reviews of education since 1947 have suffered from this handicap. They have made recommendations in respect of education and not gone on to underline the integral relationship between education and the social and economic policies of the country. This committee has chosen to do so and to that extent shows a greater sense of realism.

In fact the Ramamurti Committee goes further. It has questioned the re-designation of the ministry of education as the ministry of human resource development. In its opinion, the human being is to be valued as more than mere resource. In order to emphasise the utilitarian overtones of the expres-

tion 'human resource development' the committee has recommended that the old nomenclature be re-adopted.

According to it, the term education is broad enough to encompass the various aspects of culture and arts, youth affairs and sports and women and child development. In this connection the committee also refers to the need for inculcation of values which objective has to be seen as distinct from the output of individual schemes and programmes. As the committee says, "The hidden curriculum as distinct from the explicit one obtaining in the classroom situation, is much more important for the development of a balanced personality amongst the students."

Some of the ideas implicit in the earlier chapter entitled 'Approach' are developed further in another chapter entitled 'Roles, Goals and Values in Education'. But since the committee had already taken the view that its focus is going to be on 'alternative modalities of implementation', it is to the subsequent chapters that attention might be turned.

III

What was described as equalisation of educational opportunity in the report of the Education Commission (1964-66) has been equated with equity social justice and education in this report. This chapter has five sections and each one of them goes into considerable details in regard to the issues raised. These sections are education and women's equality, education for the SC/ST and other educationally backward sections, education of the handicapped, a common school system and Navodaya Vidyalayas. The first section alone takes approximately 30 pages and the whole chapter takes about 90 pages.

That is not all. Another four chapters deal with related issues like early childhood care and education, universalisation of elementary education, adult and continuing education, and education and the right to work. These chapters come to approximately 200 pages. Considering the fact that the whole report has 369 pages, it is evident that, in terms of proportions, a good deal of attention has been given to issues relating to social justice and education and allied matters. Added to that is the fact that higher education does not receive even 20 pages. The focus of the report should thus become clear even in the light of the attention that is given to those dimensions of education which deal with areas that have remained neglected so far.

It should be clear from this brief reference in regard to the relative importance of different themes that the thrust of the committee's report is in favour of issues that concern the vast majority of the people. Their welfare has been neglected for very long. Over the years, the focus has been so consistently in favour of the middle class and at the cost of the poor and the deprived that the educational scene has become acutely unbalanced. The basic problem in Indian education today is the neglect of elementary education. Other problems important as

they are in their own ways, are relatively less important in the context of the plight of the illiterate masses.

What needs to be noted is that this committee has not only its heart in the right place but has gone about its job of analysis in a manner which shows both concern and intimate knowledge of the ground situation. There is something appropriate about beginning with education and women's equality. The general thrust becomes clear right in the beginning when it is mentioned that as against 53 per cent for men, the rate of illiteracy among women is 75 per cent. (All figures are based on the 1981 census and appropriate adjustments may be made by those who have access to the 1991 figures.)

In this connection, the 1986 policy is referred to in a critical manner. According to this committee, the thrust of that policy lay in intervention *within* the educational system whereas the real constraints which are socio-economic and cultural in character are *outside* the school system. These have a direct bearing on the education of girls. When it comes to raising of the status of women, education *alone* is not the agent of change. Education is one factor, and an important one at that, but there are other factors also at work and those must not be lost sight of. Having defined their approach in this explicit manner, the committee discusses this issue under a number of sub-heads. The tone and quality of discussion shows insight as well as first hand knowledge as to how things are happening out *there*. Most people who are concerned with policy making are not adequately aware of what is happening in the field. This report however speaks from that perspective and is all the more valuable for that.

The sub-heads referred to above may be enumerated here: access to education and quality of learning; content of education and gender bias; vocational education; training of teachers and other educational personnel; research and development of women's studies; representation of women in the educational hierarchy; empowerment of women; adult education; resources and management. It is not possible to go into details here but some of the insights that the report offers may be quoted:

(a) "As much as 29 per cent of the entire time of a girl-child in rural areas is spent in the collection of fuel and 20 per cent in fetching water. Care of siblings also accounts for a significant proportion of a girl's time."

(b) "There is a crucial link between the easy access to water, fuel and fodder and schooling of girls. This understanding needs to be *explicitly* reflected in the policy of government and be concretised in operational designs."

(c) "Without providing fulfilled day care services, particularly for the 0-3 age groups, no school programme can hope to become accessible to older girls in the 6-14 age groups."

(d) "At present 48.6 per cent of habitations representing about one fifth of the country's rural population do not have a primary school. Only 13.1 per cent of habitations

have middle schools. The poor availability of middle schooling may be a major constraint in the retention of girls in schools."

(e) "Vocational training courses for girls...at the secondary stage should be provided in order to expand the social base of vocational education. Opportunities should be especially given to dropouts after middle schools."

(f) "Teacher training programmes in general require a critical evaluation and re-orientation within which the incorporation of women's perspective should be a key dimension. This would include sensitivity to women's issues and awareness of the problems in education of girls."

(g) "Women's study centres should be organised in all the universities and recognised social science research institutions within the Eighth Plan."

(h) "The Programme of Action (POA) recommends that women may be given 'preference in recruitment of teachers upto school level', but it does not look into problems of accommodation, security, child care, etc, which constrain women teachers particularly in rural areas."

(i) "The proportion of women teachers in primary, middle and high schools should be increased to atleast 50 per cent."

(j) "The POA concept of women's empowerment has the following two lacunae: (a) It presents the concept of empowerment of women as a process confined to women only and to be organised in isolation of men in the same community; (b) It does not refer to the critical role of raising, through education, awareness regarding the issues of women's health, including reproductive health and sexuality in the larger dimension of empowerment of women."

(k) "Earmarking 50 per cent of the elementary sector allocation for measures to increase girl's participation and making this allocation non-divertible" should be ensured.

(l) "Continuance of all centrally sponsored schemes relating in part or in full, to women's education may be treated in terms of the detailed recommendations" regarding decentralisation.

As should be evident, these few insights and observations represent a mode and timbre of thinking which is more or less at total variance with the way things are happening today. The bulk of the policy-makers are conservative, rule-bound and unathletic in their outlook. Those who implement orders issued from above do so without any sense of commitment and are devoid of imagination of initiative, or almost so. The perspective envisaged here is in a way so radically different from what obtains today that it will require a total overhaul of the existing administration structure and a new ethos of work before these recommendations can be put into effect.

This is not said by way of criticism or disagreement with whatever has been sketched above but it needs to be noted that the committee has not gone into the question of how, in what manner and at what pace, can some of these things be done. Elsewhere

in the report where decentralisation and participative management are discussed, the issue is brought up again but that is not the same thing as working out some kind of a work-plan which would ensure that a new wind blows though the stagnant system as it is run today. In other words, what is presented here assumes a different outlook on special issues as well as a radically reorganised delivery system. Neither of these assumptions has any leg to stand upon.

Whatever has been happening over the years has, whether it was so intended or not, strengthened the colonial system which we inherited in 1947. The essence of the system was that orders were given from above and those were to be carried out. Our main contribution since 1947 has been to make the system inefficient as well as corrupt. In consequence the delivery system today is distinctly less satisfactory than it was some decades ago.

IV

The 1986 policy viewed education for equality in two dimensions, viz, removal of disparities and equalisation of educational opportunities. That policy also recommended a series of steps most of which had been under implementation in one form or another even before 1986. Over the years however, the gap in the growth of literacy between the SC/ST's and the rest had been widening. Data given by the commissioner for SC and ST and various other authorities is quoted in the report in support of this contention. Even the dropout rate in the SC and ST categories is distinctly higher as compared to the rest.

Nonetheless the committee surveys the whole scene afresh but is unable to come up with any new measures except to suggest certain marginal improvements like more intensive remedial coaching, increased recruitment of SC and ST teachers, incorporation of the rich diversity of the tribal cultural identities in the co-curriculum, a special component plan and tribal sub-plan, more effective monitoring, intensive area approach, identifying a single focal agency in each state to mastermind the whole operation as also report to the Centre and so on. The fact that the committee is unable to come up with any new proposals should not be a cause for surprise or a point of criticism. On the contrary what it underlines is the fact that the existing modes of performance are inadequate, inefficient as well as underfunded and what requires to be done is to attend to the basic problem of the social and economic development of these neglected sectors of the population.

Similarly, in regard to minority groups, no new measures are proposed except that what is already laid down needs to be implemented much more vigorously. In a sense the same approach is recommended in respect of the handicapped category too.

Even without the help of data which is used in abundance, various surveys that are conducted from time to time have made it clear to all observers of the Indian scene that

what has come in the way of the more effective spread of primary education is the sheer poverty of vast sections of the population. Our strategy of development has by and large ignored them and their interests. Advances in various directions have been made and the Indian economy today is much stronger than it was four decades ago. But what has remained unchanged all these years has been the welfare of the deprived and the underprivileged and if any analysis of the contemporary scene in education chooses to linger over these problems, it is not only unavoidable but the right thing to do.

The 1986 policy too had given evidence of this concern and what the Ramamurti Committee has done is to build further on it, suggest certain improvements and give evidence of purposeful and concrete thinking. Where it errs is in assuming that a new perspective, if presented, would inspire people and make them act differently. This can happen provided, to use the oft-quoted phrase, there is political will and, secondly, the administrative system is enabled to take the load of increased responsibilities. While something is said about increased funding, the set of proposals made in that connection do not amount to much. It appears that the committee was not particularly well informed in regard to those issues; but more of that later.

V

After a fairly detailed discussion of the various aspects and dimensions of equity, social justice and education, the report in a natural sequence moves on to the theme of a national system of education. As might be recalled, this concept had been advanced first by the education commission in 1966. That commission had advocated the establishment of neighbourhood schools. A child was expected to go to the neighbourhood school whereas today what is happening is exactly the opposite.

Children are quite often transported to long distances so as to be enrolled in a particular school. Most of these schools are privately run and may be, without exaggeration, described as elite institutions. Put another way, today there are two sets of schools in the country, one for the children of affluent parents and another for the rest. It was this policy which was sought to be reversed by the education commission. That has not happened and it is on record that this was one of the more controversial recommendations of the education commission.

The 1986 policy reiterated its support to it. The POA also had suggested a few concrete steps but as this report says, it did not spell out 'any modalities or action programmes'. Having said this, even this report does not offer much by way of a plan of action. Rather it is implied that provision of significantly increased outlay for elementary education would help in the building up of the required levels of infrastructure and quality of education. Once this happens, schools now run either by the government

or by local bodies, etc., would grow into genuine neighbourhood schools.

It must be added in fairness however that this report does suggest phased implementation of a changeover within a 10-year time frame. Furthermore, it also advocates 'essential minimum legislation, particularly to dispense with early selection process, high tuition fee, capitation fee, etc'. It also suggests a combination of 'incentives, disincentives and legislation'. In other words, this committee too expresses itself in favour of the common school system but puts its faith in general improvement along a wide front. Once the situation starts improving, it stands to reason that the neighbourhood schools would not be looked down upon with contempt as they are now.

This perhaps is correct but the set of proposals presented in the report does not seem to take into account the stubborn resistance that would be offered by the elite section of the society. This section wants an advantage for itself. As of today, apart from the other advantages of a good infrastructure, better student-teacher ratio and a dozen other things, the elite category have the advantage of operating through a tongue which gives it an edge over others. The ability to wield English effectively confers such an unmistakable advantage upon those who can do so that they outdistance others. This aspect is not even touched upon in the report at all though there is a brief reference to it in a later chapter dealing with languages in education.

VI

It is in respect of the continuance or otherwise of the Navodaya Vidyalayas (NV) that its ambivalence of views comes across somewhat more clearly. Also the issue is discussed in some more detail. Both pros and cons are discussed as well as elaborated.

According to the 1986 policy, this scheme was calculated to serve two ends. One was to provide high quality education to bright children who do not have access to it today. Secondly, 75 per cent of the seats were to be reserved for students from rural areas. Reservations for SC and ST students were prescribed as per their actual population in the district (on the basis of one school per district) subject to a maximum of 15 and 7.5 per cent respectively as laid down in the Constitution.

How has this scheme worked? Approximately two-thirds of the districts in the country have been so far covered. Around 50,000 students are enrolled in them, ¾ths of them being boys and ¼th girls. As against the target of 75 per cent for rural children, the enrolment is higher in those categories by 2.5 per cent. The SC students are a little less than 20 per cent and the STs are a little over 11 per cent. 41 per cent of the students come from families below the poverty line and 63 per cent from families with an income of less than Rs 12,000 per year. Of the students, 16 per cent of the children are first generation learners and 70 per cent of them come from families which had no access to college

education. The per capita expenditure is a little less than Rs 10,000 per student. If progress has not been more impressive than what has been detailed above, it was because funds of the required magnitude were not made available. Secondly, to start with, teachers were proposed to be taken on deputation and therefore only 75 per cent of those included in the cadre strength could be appointed.

As stated above, the committee was sharply divided over this issue. Those who were not in its favour objected to the high per capita cost, the limited coverage, the academic confusion caused by the teaching of science through English and of social sciences through Hindi and so on. Not only that, the percentages of admission has begun to show a declining trend, many children were unhappy because they could not get adjusted, there was no involvement of the local community etc. Nor were all the tests culture-free or training free. Above all, a high percentage of children seemed to belong to middle income groups. Worse than that, a survey showed that children often seemed to be withdrawn and alienated from the village community and there were situations of conflict between the school community and the local community.

However, those who favoured the scheme affirmed that they had no philosophical aversion to elitism. If the existing schools were biased towards the richer section of the countryside, this could be taken care of. What is more, the functioning of the schools could be improved in so many ways by appropriate linkages with the District Institutes of Education and Training, (DIET) and other similar institutions. Lastly, it was not fair to evaluate the scheme so shortly after its commencement.

Unable to take a unanimous decision, the committee recommended that no further N Vs be established and the scheme be further reviewed after two to three years. Three major States—Assam, Tamil Nadu and West Bengal—had refused to participate in it and this fact also had to be taken into account. Meanwhile the concept of nurturing special talent which appears to underlie the establishment of these schools may be redefined, the process and mode of selection may be broadened as well as refined and the present life style and value orientation of these schools may be changed.

The committee also went on to suggest three different alternatives and discussed the merits and demerits of each alternative. Considering that this was the one issue which seemed to be the occasion for the appointment of the review committee, this recommendation looks like a bit of an anticlimax. Originally it was visualised that the scheme would be discontinued. In the event it turned out that it would continue and would be re-evaluated and reviewed in 1992-93. In a sense, the current social and political situation is so charged with controversy and tension that it is just as well that a decision on this issue has been deferred. The inability to take a clear cut decision may be the outcome of certain accidental factors

but it may turn out that this particular decision, or non-decision if it may be put that way, may not eventually prove unwelcome.

VII

After the section on education and woman's equality, the next strong section is on early childhood care and education (ECCE). The treatment of this theme is done with equal sensitivity, commitment and sense of concreteness. In a sense the real merit of this particular chapter is to put early childhood care and education at the centre of things. To some extent this is a recognition of the fact that because of poverty, children are neglected and, since they are neglected as children, there is no question of their receiving the kind of attention which would ensure their becoming a part of the network of literacy—a prerequisite both for equity and empowerment.

The committee interprets Article 45 of the Constitution as a directive principle which seeks to ensure that *every child up to the age of 14* shall receive free and compulsory education. Articles 39f, 46 and 47 respectively are interpreted to lend further support to this constitutional directive. Having done this, the committee goes on to say that this directive has so far been interpreted much too narrowly. It is made applicable only to the education of children from the age of five or six onwards. The committee however is of the view that 'ECCE is part of the provision originally envisaged under the Constitution for the development of all children until they complete the age of 14 years'.

The report adds that 'ECCE is also of immense significance from two other standpoints—universalisation of elementary education and equality of opportunities for women. *Directly* it helps to prepare the young child for school and *indirectly* it can enable girls engaged in taking care of younger siblings to attend school. The report sums up these formulations by saying, "ECCE, therefore, is a cross-sectoral programme addressing the intersecting needs of women, children and girls."

Harking back, the committee recalls the view of the education commission in having emphasised the importance of pre-primary education in child development and of its critical link with enrolments, retention and learning outcome in primary schools. The 1986 policy, however, contented itself with steps to reduce 'the prevailing wastage and stagnation in schools' and other related recommendations and did not choose to go beyond that.

In this connection, it refers to the rapid strides made by the Integrated Children's Development Scheme (ICDS) programmes in the late 70s and the early 80s. This programme is both a part and an extension of the Minimum Needs Programme (MNP) and one of the recommendations now specifically made is that the ECCE should be formally and legitimately included in the MNP.

This is a recommendation of far reaching importance. In the years to come the MNP

is likely to expand both in scope and coverage. Should that come to pass, it would have an undoubted impact on the spread of elementary education as well as the level of employment in the rural sector. The report explicitly recognises that the ECCE has 'a potential of (being) a significant generator of skilled employment for women'. If and when this happens, it would change the social and economic contours both of the countryside and slum areas in towns and cities.

The committee has estimated that children below six number about 14 crores and therefore constitute 17 per cent of the population. As of this moment, only 10 per cent of the target group receive some amount of child care services. The immensity of the tasks that requires to be attended to is thus obvious. Indeed it would require massive deployment of resources if the target of providing early child care services to all children in that age group is to be met. This single fact makes it indubitably clear that with the magnitude of funds available now it would not be possible to achieve anything more than a fraction of what is proposed to be done.

Where would additional funds come from? The national wealth has to grow before it becomes possible to divert resources to responsibilities like early childhood care. Apart from other things, all those factors which come in the way of better productivity and wastage of national wealth would have to be overcome. Clearly this cannot happen unless the strategy of development followed over the last four decades is radically overhauled. There is a good deal wrong with education at every level but what is happening in the sphere of social and economic policies is perhaps even more wrong and indeed in need of drastic surgery.

While the 1986 policy and the POA were conceptualised and developed by the department of education, the responsibility for actual implementation of the ECCE programme was transferred to the department of women and child development at the centre and the departments of social welfare at the State level. No wonder there was lack of alignment in their respective approaches and lack of co-ordination at every step. The committee goes into details in regard to strategies and models and emphasises the principles of diversity, flexibility and decentralised funding and management. Even such an obvious thing that the ECCE centres should be linked physically as well as programmatically with the primary schools has been so far overlooked.

Not only that, the 1986 policy emphasises ICDS, a centrally sponsored scheme, as the major vehicle for the achievement of ECCE goals. A survey conducted in seven States has shown that the rigid and top heavy ICDS programmes is 'weak in content and quality, costly, limited in access and is often poorly implemented'. From this it follows that the ICDS should function "in a decentralised and localised manner, encouraging local women's groups to develop models and structures suited to their needs". Recognis-

ing the holistic nature of child development, the 1986 policy had emphasised the comprehensive and integrated nature of ECCE. What was recommended, however, did not get implemented nor did the basic principles of curriculum and content of ECCE get translated into localised content.

A significant weakness of the 1986 policy was that it was silent on the entire subject of training for the ECCE programmes and on the status of the child care workers. The committee therefore goes into details in regard to the link between programme quality on the one hand and wages, job satisfaction, social status and motivation on the other. It follows from this that nothing can be done in this behalf unless educational complexes and DIETs proposed elsewhere are encouraged to assume responsibility in respect of training and networking. In order to make the whole thing effective, a system of accreditation of training programmes and agencies would also have to be developed as originally visualised in the POA.

In fact, the ECCE programme is inconceivable without massive decentralisation and employment of lakhs of additional workers. The committee feels so strongly in regard to the bureaucratic functioning of the whole thing that it says that 'it is time that we introduced a sense of realism in our management system'. It goes on to say that while voluntary effort may be promoted, the real key to success in this area is 'in the direction of non-formalising the ECCE institutional framework'. In conclusion, it adds that there is no alternative to handing over the management of the ICDS and other ECCE programmes to local groups, preferably poor women's groups through the panchayati raj framework. Can it happen? It can, provided the existing overcentralised system is dismantled and genuine and extensive decentralisation is ensured.

Resources would be a constraint in any case. The 1986 policy was more or less silent on both the magnitude of the resources required and the manner in which these were to be raised. Even the POA depended upon the help of the government and little more than that. This committee however favours that a central fund for child care services should be set up at the national level. But having made the recommendations it does not go into details and that is a crucial weakness. The committee estimates that even if 4.9 crore children (a hypothetical target) are to be covered by 1995, an annual minimum expenditure of about Rs 4,900 crore (at 1989 prices) would be required by that date. Are funds of this magnitude available? No less important, are there prospects of such funds being raised?

As stated above, this particular chapter puts into sharp focus the magnitude of the problem and the crucial importance of being able to provide child care services for children in that age group. Unless this is done, Gandhiji's statement made in London in October 1931 would perhaps be proved correct. He had said, "I defy anybody to fulfil the programme of compulsory primary education of these masses inside of a cen-

tury?" When he had made the above statement, India's population was approximately one third of what it is today.

VIII

After much detailed discussion of the ECCE programme, the theme of universalisation of elementary education (which is very well documented in the report) need not be dwelt upon at length except that certain observations made in the course of the analysis need to be highlighted. These are listed below:

(a) Having dealt with primary education, so to speak, in the earlier chapter, the focus now is on post-primary or elementary education.

(b) Since a substantial number of children are engaged in child labour, there is no alternative except to 'educationalise the work'. How to do it is however not gone into in detail.

(c) The prevailing curriculum of elementary education suffers from several defects. Only the cognitive domain (recalling facts at the time of examinations) is stressed and the component of skill formation is more or less missing. Social and cultural inputs from the community are also lacking. There is an utter absence of activity-based learning. Nor are enquiry, exploration or creativity encouraged. Above all, the mode of transaction is essentially non-participative. Unless these deficiencies are taken care of, children would find attendance in schools neither interesting nor profitable.

(d) "The school teacher is at the bottom of a vast bureaucratic machinery where there is hardly any scope for charting fresh course of action". No wonder the inspectorate system kills all initiative, obliges the teachers to adopt a stratified outlook and in the process their competence in pedagogy, gets seriously undermined.

(e) The three thrust areas at that level should be (i) convergence of services that the school can provide, particularly for girls, (ii) linkage between the school and the community and (iii) decentralise and promote the participative mode of educational planning and management.

(f) At present curriculum development and content planning in the primary and middle schools is determined by what is planned at the +2 level. This unnecessarily burdens the child in the elementary school and does not allow the elementary school level to become a self-contained stage of schooling. A good deal more is said in this vein but, for the most part, it is repetitive in character and need not be dilated upon.

Non-formal education (NFE) is the next topic to be taken up. It was introduced in the Sixth Plan and is operating in about 2.4 lakh centres including almost 78,000 centres exclusively for girls. But the programme has failed to take off the ground for a number of reasons, the most obvious of them being that the State governments are not prepared to commit resources to this programme, the administrative system does not give it the requisite autonomy and, worse than that, there is generally a lack of faith among the func-

tionaries and the families of children who are supposed to benefit from them. No wonder the instructors are underpaid, learning material is not easily available, lighting arrangements and instructional equipment are below the acceptable level and the quality of instructors as also their training leaves much to be desired.

As if all this is not deplorable enough, those who are working in the NFE are equated with those who are working in the formal system and thus there is confusion about parallel cadres and systems and so on. The answer of the committee to these problems is to non-formalise the formal school. This can be done in a variety of ways. It should be possible for instance to shift the school timings to mornings, afternoons or late evenings as suits the convenience of the children, choose the school calendar to suit the rhythm of agricultural activities, reduce school hours but increase the learning hours and so on. It is also proposed that in addition to the regular teaching staff there should be para-teachers or 'shiksha karmis' as they are called in Rajasthan.

Management in that case would have to be decentralised and village education committees would have to be set up. Not only that, the local community would have to be empowered in a substantial way before any one of these innovations can be carried out. The sad fact is that most of us have been so accustomed to receiving orders from above that all that the bulk of us can do is to carry them out, and not always efficiently either. If this situation is to change, there would have to be some kind of a shift of social opinion, a re-working of the existing social relations and the emergence of a whole new crop of people who would prefer to break with the dead weight of tradition. This is such a tall order that all that one can do is to say good luck to them.

Operation Blackboard was one of the powerful initiatives taken by the Centre in the 1986 policy. That policy sidestepped the issue raised by the 42nd amendment whereby education had been made a concurrent subject. Hardly had anything been done in pursuance of that amendment. In order to solve the gap between profession and practice, the 1986 policy laid down that the Centre should take a much greater load in respect of education than it had done hitherto. In concrete terms the strategy of Operation Blackboard was devised.

In three years from 1987 to 1990, a sum of Rs 373.22 crore was made available to the States. Also a sum of Rs 719 crore was committed to the States for school buildings. In this way, 57.70 per cent of primary schools were covered in respect of an additional room, a second teacher, preferably a woman, etc.

To some extent that was gratifying and the committee has described it as laudable. At the same it has criticised the scheme in no uncertain terms. The whole thing is handled by the Centre and, in that respect, is an example of overcentralisation. Certain defects in its operation have also been brought out (for instance, West Bengal wanted buildings

RESERVE BANK OF INDIA

OCCASIONAL PAPERS

Reserve Bank of India Occasional Papers is a quarterly journal published by the Reserve Bank of India. The journal contains technical and analytical studies prepared by the professional staff of the Reserve Bank covering a wide spectrum of subjects — agriculture, industry, money and credit, exchange rate, international trade and finance.

Recent issues of the journal contain:

June 1990 Issue (Vol. 11, No. 2)

- “Monetary Modelling of the Indian Economy: A Survey” by Narendra Jadhav
- “On Disaggregation of Household Saving into Rural and Urban Components”
by K.G.K. Subba Rao and A.K. Nag

March 1990 Issue (Vol. 11, No. 1)

- “On the Economic Performance of Major Eastern States of India: Some Issues” by B.K. Bhoi.
- “Bank Credit for the Chemical Industry (1970-71 to 1984-85)” by Balwant Singh and S.K. Adhikary.
- “Indian Exports: Diversification and Instability” by R.K. Das

December 1989 Issue (Vol. 10, No. 4): A Special Issue on Planning in India

- “Analytics of Indian Plan Models” by Narendra Jadhav.
- “Indian Plans Models: A Review” by A.K. Ray.
- “Planning and Employment: A Note on Changing Macro-Economic Perspectives of Indian Plans” by A.K. Nag.
- “Financing of Sectoral Investment during Plan Periods” by K.S. Ramachandra Rao.
- “Rural Urban Income Series: Some Estimates” by Deepak Mohanty and A. George.
- “Planning for Agricultural Transformation” by Mridul K. Saggar and V. Sunder Raghvan.
- “Configuration of Industrial Growth in the Context of Indian Planning” by Jag M. Chona.
- “India's Balance of Payments during the Four Decades of Planning” by K.R. Holla.
- “Price Trends during Five Year Plan Periods” by Mohua Roy.

Annual Subscription for 1990 is Rs. 140 inland (inclusive of postage) and U.S.\$ 100 abroad (inclusive of registered air mail charges). For any single issue of 1990 volume, the price is Rs. 35 inland and U.S.\$ 25 abroad. Issues for some of the earlier years are also available for sale. Details about the past issues could be had, free of charge, on contact to the address given below. For subscriptions and orders (accompanied by cheques/bank drafts drawn on any bank in Bombay in favour of Reserve Bank of India) please write to.

rather than additional teachers but this conflicted with the scheme as envisaged by the Centre) but the most serious of them is the fact that the States have no initiative and every thing is handed down by the Centre. One of the recommendations made by the committee therefore is that all decision making in this area should be delegated to the States. In course of time the Centre should provide funds, project ideas, perhaps ensure a certain measure of monitoring and little more than that.

IX

As a follow up of the 1986 policy, a National Literacy Mission (NLM) was launched in 1988. It has had some success. In addition several other projects have been launched in about 60 districts in different States. To what extent they are successful or not remains to be seen. So far the only notable success has been in Kerala. When the report was being written this success had not yet become public but it was clear that things were moving in the right direction. What requires to be noted is that this committee has enlarged the whole concept of adult and continuing education. To quote its precise words:

The questions of survival, development and justice are to be interwoven into content, pedagogy and learning situation of adult, letting literacy come in organically in the process when, and if, it becomes the felt need of the adult learners. This understanding would help in avoiding the disproportionate emphasis on literacy campaign.
